ASHTON'S FACTORY FILLED SALT.

THE BEST FOR BUTTER AND CHEESE.
FOR STOCK.
THE BEST FOR HOUSEHOLD PURPOSES.
FOR PROVISIONS.

In order to bring Ashton's Salt within the reach of **Farm Dairies** and **Household Consumers**, it is now imported in **56 lb. Bags**, as well as in 224 lb. Sacks, and should AT ONCE be in use

IN EVERY FAMILY, ON EVERY FARM.

A sack of Ashton's Factory Filled Salt contains over half a bushel more than a sack of Higgin's Eureka Salt, and about a bushel more than a 280 lb. barrel of Onondaga Salt. It takes from three to six pounds of Ashton's Salt to one hundred pounds of butter, and not to exceed three pounds to one hundred pounds of cheese, so that the extra cost of using Ashton's, which enhances the value of butter from two to five cents per pound, and cheese from one-half to one cent per pound, is not worthy of consideration; the butter is increased in value $2 to $5 per hundred pounds, at an extra cost of not to exceed 1½ cent to 3 cents for salt; the cheese is increased in value 50 cents to $1 per hundred pounds, at a cost not exceeding 1½ cent for salt over the lowest priced salt used in the Dairy. In fact, there is no investment that pays the butter and cheese maker so well as the purchase of Ashton's Salt.

THE NOVELTY
POCKET SCALE.

A Beautiful, Useful and Easy Selling Article

Wanted by every Farmer, Hunter, Trapper, Fisherman and Sportsman and In every Family.

The most perfect scale ever invented. Is graduated from 2 oz. to 15 lbs; is about the size of a man's forefinger; weighs only 2 oz., and can be carried in the pocket without inconvenience. Thus being always ready to meet an ever-recurring and universal want. The novelty, beauty and usefulness of the article are sure to sell it. By an ingenious contrivance this little wonder is so arranged that, by its sliding shell, it may be so adjusted as to give the exact weight of matter weighed, without subtracting the weight of the receptacle in which the matter is weighed—an advantage possessed by no other scale. It is a new idea, and is sure to sell.
Each scale is heavily nickel-plated, and will be sent post-paid on receipt of 50 cents. Mention the Rural New Yorker.

SPRING WHEATS. TWO-THIRDS NATURAL SIZE. (See Page 582.)

Field Crops.

WHEAT.

DEFIANCE AND CHAMPLAIN.

FIRST REPORTS.

Comparative Tests of Spring Wheats Upon Small Areas.

EXPLANATION OF FIRST PAGE ENGRAVING.

THE several parts reduced to two-thirds natural size. Plot No. I. Spring Mediterranean, No. II. Spring Russian, No. III. China, No. IV. Defiance, No. V. Champlain, No. VI. Clawson. (Winter.)

NOTES FROM THE RURAL FARM.

Spring Wheats.

We have reason to feel much disappointed at the results of our spring wheat experiments. Five plots thirty-three feet square, were sown to different varieties April 19, and all were cut August 17. The varieties were:

Plot No. 1.....Mediterranean.
" " 2.....Russian.
" " 3.....China.
" " 4.....Defiance.
" " 5.....Champlain.

For two years previously, turnips were grown upon this land, manured with bone flour drilled in. Three years ago rye was sown with a light sprinkling of bone. Previous to this for ten years at least, the land had not been cultivated. For the spring wheat, Mapes' Complete manure alone, was sown broadcast upon the five plots, at the rate of 500 lbs. per acre. Up to the time when the heads began to set, the weather had been favorable, and the growth of straw and size of the heads were such as to promise a remarkable yield. We were the more hopeful of this, inasmuch as the farmers of this part of Long Island have from their own experience looked upon spring wheat as not worth sowing. About this time, however, showers were of almost daily occurrence, followed by a powerful sun. The humid atmosphere was scalding. The heads set imperfectly, and the yield, as will be seen, was not such as to change materially the prevailing opinion of the farmers about us.

Defiance and Champlain

We were most interested in the new wheats, Defiance and Champlain. These originated with Mr. Pringle, of Vermont, who is well-known as having devoted himself assiduously for years, to the improvement of various farm crops, by cross breeding. The firm of Messrs. B. K. Bliss & Son, offered these wheats for the first time last spring, after, as they state, a careful trial of six years, and to them we owe our thanks for the seed in the experiments of which we are speaking.

Champlain was produced in 1870, by Mr. Pringle, so Mr. Bliss informs us, in his endeavors to unite the remarkable hardiness of the Black Sea with the superior quality of the Golden Drop. Several varieties were the result of this cross, from which Champlain was chosen as realizing the end in view.

Defiance "was the result of experiments in 1871, to incorporate superior qualities upon the hardy stock of our common Club Wheat, by hybridizing it with one of the finest, whitest sorts of the Pacific coast." Of the five varieties, Defiance bore the heaviest straw, and broadest leaf. It would seem, as we have before remarked, that it is not at all liable to lodge, and, in fact, while others were lodged during several storms, this, and the same may be said of Champlain, remained as upright as before. It also tillers freely, and would no doubt prove an excellent variety to be sown in drills a foot apart, so as to admit of cultivation.

The plots as we have said, were 33 feet square or one-fortieth of an acre in area.

No. 1	Spring	Mediterranean, yielded	.....	12 lbs.
" 2	"	Russian,	"	15 "
" 3	"	Spring China,	"	28 "
" 4	"	Defiance,	"	27 "
" 5	"	Champlain	"	18 "

The yield of Defiance would have been greater, had it not been cut too early. It was the last to ripen, and we had intended to cut the others and allow this to remain awhile. But the instructions given were forgotten or disregarded. A medium-sized head of

Mediterranean matured	.....	34 grains.
Russian	"	27 "
China	"	33 "
Defiance	"	57 "
Champlain	"	45 "

while a medium-sized head of Clawson (fig. vi.) taken from a field which averaged at least 25 bushels per acre, bore but 32 grains. The large number of grains in the single head of Defiance as compared with the weight of the grain of the entire plot of this variety, will show the extent to which they were shriveled, and the same, though less forcibly, may be said of Champlain. Judging by the samples of Defiance which we have seen, the grains are fully as large as those of Clawson. Taking the average head of Clawson as a guide, it would appear that had the grains of Defiance fully matured, the yield would have been nearly twice as great. To state it exactly: If 32 grains of Clawson give 25 bushels to the acre—57 grains of Defiance would give 44.53 bushels, and as great a difference as this would have been conjectured by anybody comparing the one with the other, judging by appearance alone.

Our faith in Champlain and Defiance is *not* weakened by this failure, which we attribute entirely to an unfavorable season.

DEFIANCE WHEAT.

The head of Defiance Wheat presented on p. 583 represents one of a small bundle received by an acquaintance a day or so since. No letter explaining where, or by whom raised, has as yet arrived. Among the heads of this bundle there was scarcely any choice, the one from which our accurate sketch was made being as large perhaps as any. The grains were plump, light amber colored, and as large as the best specimens of Clawson.

CHAMPLAIN AND DEFIANCE WHEATS.

DEPARTMENT OF AGRICULTURE,
Washington, D. C., Aug. 22, 1878.

EDITOR RURAL NEW-YORKER—*My Dear Sir:* Reports thus far received of the "Defiance" and "Champlain" wheat are as follows: Miss E. L. Howard, top of Lookout Mountain, Walker Co., Ga.—"Rust and fly destroyed it. Not as much yield as sown and poor quality of grain." Mr. Ernst, of Iowa, reports, "Champlain yields at the rate of twelve bushels per acre, small, shrunken. Defiance yields at the rate of 14 bushels per acre." Mr. Plumb, Genesee Co., Michigan, reports, "Champlain grew well, but was destroyed by midge and rust." Mr. Stever, of Tama Co., Iowa, says, "both varieties grew well with long heads, looked fair, but matured no grain." He thinks they are winter wheats, particularly the "Defiance." These are all the reports thus far received of those spring grains.

The "Silver-Chaff" wheat distributed by the Department last year, has an unusually good record; but it is too early yet to make up a full account of the different varieties and their value. Very respectfully,

WM. G. LE DUC,
Commr. of Agriculture.

WHEAT SOWING.

L. J. TEMPLIN.

PREPARATION OF THE SOIL.

As one of the great staples of the United States, the wheat crop is worthy of every advantage that it can possibly have. The profit of wheat raising depends not so much on the area in cultivation, as on the yield per acre. In nearly all items of expense it costs about as much to raise 10 bushels as it does to raise 20 bushels per acre. A little difference in the preparation of the soil and seed, and in putting the latter in the ground, will often make all the difference between a profitable crop and one that does not pay expenses. It is important, therefore, to give strict heed to all the conditions essential to success in this business. Much depends on the condition of the soil. I shall not stop to consider the different kinds of soils or the manures by which they may be fertilized, but shall proceed to invite attention to some of the mechanical means to be employed to bring it into the best condition for the reception of the crop.

In the preparation of the soil by mechanical means, the object should be to stir it deeply and pulverize it thoroughly. It is impossible to get a soil too finely pulverized for a wheat crop. Indeed much of its vigor and healthfulness, and especially its productiveness, depends on this condition. The fine, feeding roots will not enter a hard clod any more than they will a stone; and hence in a soil that is largely composed of these, the growing crop will be unable to get the benefit of a considerable proportion of the plant-food stored up in it. The harrow and roller should be employed to reduce the soil to as fine a tilth as possible. The finer the soil is pulverized, the greater the amount that will be accessible to the roots of the growing crop. And where it is sufficiently fine, the roots will find their way to all parts; their number will be greatly increased, and the crop will derive the greatest possible benefit from the soil.

But depth of soil is of as much importance to a wheat crop as fineness. The roots of the wheat plant penetrate deeply when the circumstances are favorable. The average depth is about three to four feet, but in favorable soils they run considerably deeper. In one case the roots of wheat of only forty-five days' growth, were found to have penetrated a light soil to a depth of seven feet. From these examples we may see the importance of a deeply pulverized soil in order to get the most vigorous growth possible. This depth of soil becomes especially useful in seasons of drought. If by shallow plowing, and a compact subsoil, the roots of the wheat are confined to a few inches of the surface soil, a severe spell of dry weather will prove very damaging to the growth of the crop, and cannot fail to greatly reduce the product. A deeply stirred soil will admit the roots to a depth that will give them access to a constant supply of moisture, even during times of severe dry weather, and thus a good yield will be insured when otherwise it would probably be rather meager. A soil prepared as here suggested, seldom fails to give satisfactory returns.

ROTATION.

THE preceding crop often has a very important bearing on the fate of its successor, and it is well, even in the absence of a regular rotation, to have regard to the coming wheat crop when planning for other crops. Probably the very best crop to precede wheat is red clover. This, even when mown, leaves a large amount of organic matter in the soil, and this is composed largely of those substances most needed by the wheat plant. To get the most good from a clover crop, it should be turned under when the flowers are generally drying up. If the surface is well cultivated once or twice before the time to sow wheat, it will prove very beneficial. Flax is an excellent crop to precede wheat. It seems to leave the soil just in the best condition for the wheat to prosper. Buckwheat and the various root crops leave the ground in good condition for wheat, but they do not generally come off the ground as early as it is best to sow wheat. In the Eastern and Middle States it is not advisable to sow wheat after wheat, as the later crop seldom succeeds well under such circumstances. But in the wheat regions of the West, it is a common practice to keep the same ground in wheat for a considerable number of years. And the practice does not seem to have any injurious effect upon the crop.

MANNER OF SOWING.

Having the grain properly prepared, the manner of sowing becomes an important question. The advantages of drilling over broad-cast sowing are now so generally understood that it would hardly seem necessary to argue the point; yet there are some who still seem not to understand these advantages. It is certainly a matter of considerable importance to have a perfectly even distribution of the seed over the surface. This can be done only by the use of the drill. A matter of even greater interest is to have the seed placed at a uniform depth, and more especially to have it put in direct contact with the moist soil. The impossibility of accomplishing these ends by any other means than by the drill will be conceded by all. In broad-cast sowing the grain is generally thrown on the top of a dry surface, and, even if covered by the drag or harrow, it is just as likely to be in contact with dry soil as with moist. That which comes in contact with moist soil will probably germinate and grow at once, while that which is left in dry dirt, will have to wait for a rain or for a slow and tedious germination, owing to a deficiency of moisture. It is easy to see that, under such circumstances, the growth will be quite uneven.

SPRING WHEAT—PRINCIPLES OF CULTURE.

W. H. WHITE.

THE wheat plant was cultivated at as early a date as any plant on record. Its origin is unaccounted for, although many theories have been advanced therefor by different scientists. Whatever or wherever its origin, it is the most important of bread-plants or grains known, and is more generally used by civilized man than all other grains adapted to the purposes of food. It is cultivated in all climates adapted to its growth. Being so universally cultivated in so many varying climates and in such different soils, what wonder that there are so many varieties, differing in some important, or unimportant, particulars?

WINTER AND SPRING WHEAT.

Wheat is grown as a biennial or an annual; and that either may be produced from the same seed is proved by experience; for it is on record that winter wheat allowed to commence germination in fall, then frozen and kept frozen and sown in spring, ripened grain in fall, which sown the following spring, ripened its seed in summer, and thus became permanent summer wheat. Others have changed winter wheat to summer wheat and *vice versa* in two or three seasons, each way; so that it would appear from such experiments that winter and summer wheats are one and the same in nature. However they may differ in time of growth or composition, in chemical analysis there is scarcely more difference than is found in different varieties of winter grain. Why then is fall-sown wheat so much more generally preferred to spring by the great majority of cultivators? There may be several reasons adduced therefor; but I only name one or two. Of these the first is that winter wheat is sown at a season when there is more leisure, and the soil is generally more easily fitted for the seed than in spring. The plant also tillers more and produces more abundantly from the same amount of seed; and the grain makes a superior quality of flour, more sought for by consumers. Such reasons are sufficient to induce farmers to continue the practice; and they will keep on doing so, to a greater or less extent, whether with or without reason. Some of the arguments used in favor of winter wheat are well founded; others now have no valid support, owing to improved methods, such as improved systems of culture of spring wheat, and the introduction of the "New Process" for making flour from it.

CULTIVATION.

There are certain principles underlying and governing all culture and growth; and when those principles are understood and applied, culture will be less intricate and more remunerative

The first requisite in the cultivation of spring wheat, or indeed of any other crop, is to so prepare the soil as to fit it in the manner best adapted to carry out the natural demands of successful growth. Next, seed of the requisite quality is needed, such as is most suitable to the soil; and then the seed must be planted at the right time,—learned by observation and experience—and in the best manner conformable with the laws of germination and growth.

Where many other plants require a loose, yielding, mellow soil, particularly at or near the surface, wheat rather luxuriates in one less loose, yet still finely pulverized for the first inch or two below the surface, and at a lower depth more open, mellow, etc.; but its greatest store of plant food should be within an inch or two of the surface. To form grain, seed-wheat requires plant-food adapted to its support, just the same as all other varieties of plants do; and unless the soil holds all the ingredients of this in abundance in an available form, the deficiency must be made up by application of manures, or the crop will fail in proportion as they are deficient. The wheat plant must also have suitable moisture in the soil in which it grows, yet a wet foot-bed is death to the crop, so that natural or artificial drainage is essential. General laws governing culture must be adapted to individual cases, or crops, and, in this case, grain, not foliage, is the object aimed at, therefore culture should be directed to this object, by applying fertilizers which go farthest towards developing seed rather than stimulating growth of foliage.

EFFECTS OF FERTILIZING AND CULTIVATING.

Although we may not precisely understand how the plant elaborates its elements, prepares gluten, starch, etc. from these elements, we know that it is done, and that, unless these elements can be drawn from some source, earth or air, the grain is not formed at all. In order, therefore, that the plant may absorb into its growth any particular element from the soil, such element must be in excess of any fixed compounds of the same in that soil, or, in other words, be free. Among the reasons given above why winter wheat is grown in preference to spring, one is that winter wheat tillers more, or that a greater quantity is grown from the same amount of seed. The reason why it tillers more, or produces a larger number of seed stalks from a single seed, I will not here attempt to set forth; but I will rather say how spring wheat may be induced to tiller more than it does as a general rule.

In germinating, the seed first sends out seed-roots, which serve to take up nutriment for the young plant until it has grown sufficiently to form a crown, joint or knot, just below the surface. From this point the plant tillers, or sends out new roots, from which additional stems rise. Now, if the soil is right in all respects, filled with food and sufficiently comminuted, new plants will form freely; but if not thus well-conditioned, the tillering is proportionally less, or does not take place at all. This statement every observing farmer will or easily can corroborate. Now, in order that spring wheat may be induced to produce, tiller, more from the same seed, the soil needs to be put in a condition most conducive to this result.

PREPARATION FOR SPRING WHEAT.

As it can hardly be expected that early spring plowing can be done, to any considerable extent, thoroughly and properly in season for spring sowing; it is necessary to plow the ground thoroughly and deeply in fall or early winter. In the spring, work the surface, an inch or two deep, with a pulverizing harrow, thus forming a fine seed-bed, while the lower stratum will usually be in fine condition for the crop, provided it was properly worked in the fall, and the soil be loamy, not clayey. Phosphates, lime, ashes, charcoal, fine or in dust, furnish suitable pabulum for the production of superior quality as well as greater quantity of grain, and one or more of these fertilizers should be applied at the time of seeding—the quantity per acre must depend upon circumstances of soil, etc. A wheat soil ought to have been previously cultivated to some dissimilar crop, for which clean culture is requisite, and should not be used for the same crop oftener than once in a rotation of three to five years, unless special treatment is adopted.

THE BEST VARIETIES?

Soils vary so that there is little necessity of saying anything concerning best variety for growing, and even if one particular variety were recommended, the soil might be uncongenial, for it is well-known that a wheat which does finely on one man's farm or in his hands, if given to another farmer in some other locality, although

the soils may apparently be similar, may prove quite unsatisfactory; all of which may be owing to different or varying causes.

When we can grow "thorough-bred," "full-blooded" wheat, then we can recommend that variety; but so long as we can go into a field of wheat and gather many distinct varieties all growing from one named variety sown, there is little use in recommending particular varieties, as all such degenerate from careless culture, harvesting, threshing, etc. So long as our present hasty culture, etc., of wheat continues, just so long will change of locality of seed prove beneficial, if the change be made judiciously—that word *judicious* is a very convenient one here and elsewhere. When we can obtain and cultivate a "thorough-bred" wheat universally, and do it in the same careful way in which we propagate choice plants, blooded stock, etc., then we shall be able to rely upon the produce of the former coming as true to strain as that of the latter. In proof of this assertion, witness the culture of wheat on the banks of the Nile in Egypt, where the same seed has been cultivated for 3,000 or more years, yet change of seed there has not been found necessary.

My readers may feel disappointed that I have failed to go more into the details of culture, mode of improving seed, varieties, etc., but such information has been repeatedly given in our agricultural literature, so that I have thought it best to take a somewhat different course, and in preference, to advocate principles of careful, intelligent culture—though but imperfectly. Personal inspection and inquiry among observant, intelligent farmers, will teach more in a few hours than can be gathered in a much longer time devoted to reading details of culture, even if these are given by the most successful wheat-grower; for often many things are brought out in conversation that one would never think of while writing down his experience, or which, at least, he might think unimportant.

Worcester Co., Mass.

Farm Topics.

SELF-SUSTAINING FARMS.

Every farm ought to be self-sustaining in a monetary sense, and, if away from any supply of manure which could be had at a price to pay for hauling, it should be self-supporting in the matter of fertility, and this, of course, must depend on the system pursued. A farm managed upon a regular course of cropping, similar to any good system where every alternate crop or the disposal of the crop returns all that the two crops have taken from the soil, will be a remunerating one if the farmer understands his business sufficiently to keep the right kind of stock to pay for raising, fattening, &c.

In England, when farmers have what is called "the refusal" of a farm, that is, so many days to make up their minds whether they will rent it or not at the price asked, it is a common practice among them to take a friend or two, and then to make calculations, and these are often made simply by starting with the opinion that the whole produce sold should, to make the tenant safe, amount to three times the rent or, as the common expression is, "it ought to make three rents."

One rent is, of course, for the landlord, a second of a like amount is to pay for labor, taxes and bills for repairs of tools and replacing everything worn out or broken, while the third rent is for housekeeping, clothing, schooling for children, &c., and for interest of capital employed. The chief consideration is to keep the land in such a high state of fertility that the income from the sale of animals, wool, butter and wheat, malting barley and a few other things, will always be self-sustaining and so that in extra good seasons, it may give some over and above this.

There is no necessity for one exact and severe system to be adhered to, though, to save trouble on large estates in England, it is usual to keep to one course, as where there are so many tenants it saves so much inquiry and watching that the spirit of the agreement be not broken.

American farmers, even those who have money, cannot be made to see the advantages of fattening cattle and sheep. In managing the latter more especially, they keep them so long on hand through not feeding them well enough, or they send them to market in such a lean condition that they make less even than half what they might do. Now that there is a certain market for meat if only it is of good quality, and when even American horses sell well across the ocean, paying well for sending them there, every farm in the United States may be made self-supporting in every sense of the word.

When sheep husbandry was first found to help agriculture in England by combining with it root culture on the drill system, English farmers were so slow and obstinate, that the landlords had to send to Scotland for bailiffs and stewards to enforce the system. Then increase of sheep increased productiveness of the land in a surprising degree, and, here in the United States, the leading agriculturists must change their system and get rid of all the old-fogy ideas, or their farms will never be self-sustaining.

An Old Hand.

THOROUGH TILLAGE.

This is an art that every farmer and gardener should thoroughly understand and effectually practice, if he would grow good remunerative crops, either on the farm or in the garden. Soil well tilled is rendered productive, regardless of its particular class, provided it be not destitute of the elements of plant-food. This is done by plowing, harrowing, crushing, with all the other methods of stirring it. Old Jethro Tull claimed from the lessons of experience as a farmer, that thorough tillage would entirely obviate the necessity of using manure. Soils, he maintained, contain all the elements of plant-food, which are set free and ready for use by thorough tillage.

A SELECTED HEAD OF DEFIANCE SPRING WHEAT.

The plow turns up the soil and exposes it to the atmosphere which acts thereupon, rendering it soluble—the condition of plant-food. The first beneficent effect of plowing is to loosen and render the ground friable. Land that is firm and hard is not in a favorable condition for plant growth. If the attempt be made to grow a crop on soil thus conditioned, the farmer or gardener is doomed to disappointment. Exposure to sun and air increases fertility. The oxidation of soil refreshes it. Fertility is further increased by tillage in bringing up the silicates and exposing them to atmospheric air. Double silicates contain ammonia which, being liberated, promotes fertility and plant growth.

The roller should be used to crush lumpy ground with the harrow, thus fining the soil—an important condition of a seed-bed. If the soil be too light—porous—as is sometimes the case with sandy ground, the use of the roller renders it more compact, and therefore in a better condition for plant-growth. Fineness and moderate compactness are essential conditions of a good seed-bed.

Horse-hoeing and hand-hoeing are found necessary to promote the circulation of moisture and air in the soil, as well as for the destruction of weeds, unless it be decided that it is better economy to grow these than it is to pay laborers to remove them, which may be deemed scientific, but not economic by farmers generally.

Drainage is often found to be essential to thorough tillage. Soils that hold water must be mechanically assisted to discharge it before the best crops can be grown. Thus is removed, with the water discharged, the organic acid left by decaying vegetable substances. Drained land is warmer than when undrained. The improvement of soil for plant-growth makes it more healthful for animal life, this being due largely to the growth of sweeter and more nutritious herbage. The thorough drainage of land not only increases the productiveness thereof, but it also diminishes the cost of tillage. Drainage, thorough and deep, must go hand in hand with thorough tillage.

Suffolk Co., Mass. Leander Wetherell.

UNITED STATES' vs. ENGLISH AGRICULTURE.

Taxes are altogether much heavier in England, than in this country; implements are more numerous and more expensive and more labor has to be expended in harvesting the crops and in cleaning the land, because the climate is so much more showery. On the other hand, all kinds of tools and machinery are far stronger and will last much longer.

The United States' farmer can now send fresh meat and every kind of produce to England at a much higher price than they made formerly, yet the farmers complain of hard times. The farmer here, even if a gentleman with an abundant capital, does not keep his land in the high state of fertility to be found across the Atlantic, consequently his returns are less. Then, in addition to this drawback, the American has a great deal of waste land, and even that which is in cultivation, is not in use all the time. For instance, rye, wheat, oats, barley and peas are all ripe and hauled to the barns about the first of July or by the middle of that month at the latest, and where there are no grass seeds sown, the ground will often be idle till the next spring, whereas there would be ample time to grow turnips, rape, Hungarian-grass or several other crops.

Then, the American farmer does not sow his turnip seed in a way to produce the best crop and on some farms aspiring to be models, there are no beets for cows, no carrots for colts, no swedes, and the few common turnips growing are all in bunches intermingled with weeds, and presenting such a deplorable aspect that any tenant farmer in England having land in a similar condition, would be notified to quit the holding at the first opportunity.

In many of the Eastern States, the farms are so very much exhausted that customers cannot be found for them even at the original cost of the house, barns and fences, while in some instances, the land and buildings cannot be sold even for the present value of the latter. It ought, therefore, to be a consideration with any one going West, whether it would not be better to buy one of these poor farms and, instead of taking a new farm in the West and expending the money which would be required for building a homestead fences, lay it out in renovating the land in the East. There are the conveniences of a good market and the advantages of civilization in its broadest sense in favor of the latter place.

A Veteran.

NOTES FROM A BACKWOODS FARM.

CHEESE-MAKING ON A SMALL SCALE.

The weather being hot and butter very cheap—8 or 10 cents per pound—I decided to use my knowledge of cheese-making in manufacturing the milk from our half-a-dozen cows into cheese. A neighbor proposed to add the milk from his four, so that I have the milk from ten cows, weighing from 160 to 180 pounds daily. A tub in which to set the milk, a lever-press and other utensils were provided, and I went to work, making every day a cheese weighing from 18 to 20 pounds, when taken from the press. I have now been making them five or six weeks and the cheeses are pronounced good by those who have tried them. I hope to have plenty for home use during the fall and winter, besides some to sell, my neighbors supplying a home market for all the surplus at about the price of butter.

GARDEN NOTES.

I have had strawberries and raspberries in abundance. The Philadelphia raspberry has more than kept up its good reputation; we were picking the last of them about the first of August. They have been extra large and fine this year, and such quantities of them as we have picked! We have had fresh berries at almost every meal, canned berries, "jammed" berries and dried berries, besides berries to sell; and it was a real satisfaction to sell them, for I could set my own price on them and no grumbling. The only trouble was, they would not go around among my customers. I only raise the common, sour cherry, but of these I have had an abundance. Currants were fine, free from worms and blight. After trying the white-cherry, grape and other new varieties, I pronounce in favor of the old Red and White Dutch, especially the latter, as being the best for culture in the farmer's garden.

I shall have some apples, but of rather poor quality, and somewhat wormy. The Red Astracans are ripening now, and they are about the best and earliest summer apples we have. The Tetofsky, which was praised so highly some years ago, here at the West, does not meet my expectations. It makes a fine compact tree for the garden, but, in productiveness and quality of fruit, it is not nearly equal to the Duchess of Oldenburg or the Red Astrachan. The fruit is inferior to either of these varieties both in quality and size, and the tree much behind in productiveness, while in hardiness the trees are much the same. For a late fall apple, the Famouse is the best we have. The old Talman's Sweet takes the lead as a hardy and productive winter apple.

Grapes are about a failure this year. Pears and plums we do not raise to any extent; although one plum tree left, stands heavily loaded with fine, smooth fruit, free from curculio. I think it is of the Yellow Egg variety. Blackberries are beginning to ripen freely, and, although not a garden fruit with us, we expect to gather them in abundance from their native fields and woods. I have sometimes found plants bearing extra-choice berries and have tried transplanting them to our garden, but they do not seem to stand civilization well.

John Rusticus.

Outagamie Co., Wis., Aug. 15.

Horticultural.

NOTICES OF SOME OF THE NEWER STRAWBERRIES.

T. T. Lyon.

America is understood to have originated in the State of New York, although, for some unexplained reason, it seems to have been disseminated from Kalamazoo, Michigan, about the year 1874. It is early, the quality superior, and the size fully medium; but it lacks color and firmness, and is hence unfitted for the markets. In 1876, it was the most prolific variety I saw; but it can hardly be said to have since maintained that character.

Bidwell is the name conferred by the South Haven Pomological Society, upon a strawberry understood to have originated with Mr. Bidwell, formerly of this place, (South Haven,) and which was characterized, in the report of the Committee of the State Pomological Society, as the best and largest berry exhibited at the session of the Society held here, in June, 1877. The plant is very vigorous, even on light sand. Fruit very large, long, conical, bright crimson; but with less color at the tip. Firm, fine quality, productive. Season medium.

Black Defiance has fruited with me but one season, and that scarcely a favorable one; but it has favorably impressed me, and seems likely to assume a high position, as it possesses size, high quality, and attractive color.

Boyden's No. 30, (Seth Boyden).—I know no reason why this should not take high rank, both as to size and quality, save the fact of the excessive vigor of the plant; which, if permitted, will rapidly cover the entire ground with plants at the expense of fruit. If grown in hills, with the resolute cutting away of the runners, it will be found satisfactory both as to quality and size, although it may prove too soft for distant shipment.

Captain Jack ought certainly to have received a more creditable name. As attractive as the Wilson when at its best, it is nearly or quite as productive as that old favorite, and at the same time quite its superior in quality. I regard it as promising well for market, and good enough for the home plat.

Champion has now borne with me three years; the trial confined to light soils, where it has shown itself very productive, maintaining a fully medium size very evenly. Its color and firmness fit it well for the market. Its quality is also satisfactory.

Col. Cheney, as originally introduced here and claimed to have come direct from the original disseminator, proved to be Jucunda. The genuine variety, subsequently introduced, is but partially tested. So far, it promises to maintain its Eastern reputation.

Cowing's Seedling, on light soil proves very productive, of large size, bright color, and high quality. It is hardly firm enough for distant marketing. On heavy soils, and especially with irrigation, complaint is made that it frequently becomes overgrown and misshapen.

Cumberland Triumph has only shown us a single crop; hence I will only say that, in size, color, texture and flavor, it seems entitled to high praise. A little more firmness would doubtless improve its character as a market berry; still should it establish a reputation for productiveness, it would doubtless assume a high position in this respect.

Damask Beauty has shown us its fruit for a single season only, and has not, so far, developed any very strong points, as compared with several others on our lists. Farther experience is requisite to establish its comparative merits.

Duchesse, although but partially tested, seems destined to sustain its reputation at the East as one of the most desirable of the recent introductions. We await its performance in the future.

DUNCAN, upon a single year's trial, shows very useful qualities as an amateur variety, for which purpose its earliness, high quality and large size are more important than ability to withstand rough treatment.

EARLY HUDSON, with three years' trial, has shown fine qualities as a market variety. The plant is strong and healthy, bears the sun well, and is very productive. The fruit is large, even-sized, well colored, firm, and of fair quality.

EXCELSIOR, upon a single year's experience, gives evidence of value of no mean order. I doubt its adaptability to market uses; but for the home plat, I am impressed with the idea that it is worthy of a place at the front, since it combines mild, rich flavor with good size and fine appearance.

FRENCH is a vigorous and prolific variety of fair quality, of fine size and appearance, but lacking in firmness.

FRONTENAC is understood to be a descendant from Russell's Prolific, under the hand of the originator of that variety—the late Harvey Russell. The plant is vigorous, and the few specimens of fruit from plants of last spring's setting, give indications of good size and quality. The flowers are pistillate—a fact which militates against its prospective value. I am not aware whether or not it is yet offered for sale.

GOLDEN DEFIANCE is a fine late berry which, a few years since, would doubtless have attracted considerable attention; but the avalanche of new and wonderful sorts at the present time urged upon the attention of the public, seems likely to leave this in the background.

GRACE is clearly only an amateur variety. Although the quality is good, the plant lacks vigor. So far as I have been able to observe it, it shows but faint signs of being able to make its way to the popular favor.

GREAT AMERICAN has done almost nothing with me this season; but, as I hear the same complaint from localities in which it has heretofore proved successful, I await further experience, supposing that with me, as elsewhere, its ill-success may be due to an unfavorable season.

LATE PROLIFIC was received by me without any qualifying designation. There are so many *Prolifics* that I am in doubt whether or not it is identical with any one of those favored with a prefix. I suspect that it has too many competitors for popular favor to be able to win its way to a prominent position.

MAJOR MCMAHON, as grown in light soil, seems to lack vigor, and the stems are short, leaving the fruit directly upon the ground—a serious fault; but it is so productive, and the fruit is of such fine size and quality, and is so abundant, also, that I regard it as a variety of much promise. For a near market it seems to be firm enough to endure the requisite handling.

MATILDA is much after the style of Early Hudson, and, like it, possesses valuable qualities as a market variety.

MONARCH OF THE WEST has now been generally tested in this region, and has acquired extensive popularity. Although somewhat elongated in form, and liable to the charge of sometimes coloring imperfectly at the tip, its firmness, good quality and large size, together with the vigor and productiveness of the plant and its capacity to adapt itself to both light and heavy soils, supply an array of recommendations that seem quite likely to place it in the front rank as a variety suitable for both market and home use.

ROMEYN'S SEEDLING possesses qualities, both of plant and fruit, very similar to Champion, to which it is nearly or quite equal in productiveness. It is, however, considerably more acid than that variety and perhaps somewhat less firm.

RUSSELL'S ADVANCE is also said to be the result of a cross, under the hand of the late Harvey Russell, between the old Russell's Prolific and Triomphe de Gand. My plants were put out only last spring, and, allowing for this fact, the little fruit the plants have been allowed to bear, impress me favorably with the variety. It is hermaphrodite.

SENECA CHIEF was, so far as I am informed, first disseminated by parties at Kalamazoo, Michigan, jointly with the America, and is said to have originated from the same source. It is somewhat popular here as a late market sort; for which purpose the vigor of the plant, and its great productiveness, together with the size, color, quality and firmness of the fruit, especially adapt it. So far as I have observed, it is at home in both light and heavy soils, although the finest crops I have known have been grown upon the latter.

SENECA QUEEN is yet another result of Mr. RUSSELL'S cross of the Russell's Prolific with Triomphe de Gand, and is equally vigorous and promising. The quality of the fruit is good; but we need at least another year's experience with it, to warrant a conclusion from personal observation as to its probable value.

SPRINGDALE is, to my apprehension, promising as an amateur variety, for which purpose it possesses special qualities; but farther trial is requisite to determine its measure of success here.

STAR OF THE WEST is entitled to further trial. So far, my experience with it, in an unfavorable season, fails to warrant the commendations bestowed upon it in other localities.

STERLING, also, is yet too recent an introduction to have fully shown its qualities with me. Unless large allowance be made for the unfavorable character of the past season, I must assume that this, too, has been over-praised, or otherwise that our soils or climate are not to its liking.

MARVIN.—A few days since a gentleman of this name, residing in Clinton County, Michigan, called on me with specimens of several varieties of strawberries preserved in liquid. Among them was one originating with him, which was of such fine size, and even in its preserved state, gave such decided indications of valuable qualities that, at my request, he sent me a few plants for trial, together with a history of its origin, from which I extract as follows:

In the spring of 1874, this seedling, among others, came up where a box of berries—either Wilsons or Jucundas—had, the year before, been spilled. The parent plant fruited in 1875. The fruit was larger and finer in 1876, and proved to be *very late*. In 1877 and 1878 it produced well and attracted great attention. The berry combines the qualities of the two supposed parents above named, and is, in some respects, an improvement on both. It resembles the Wilson in its bearing and shipping qualities, and holds its size through the season better.

Mr. MARVIN says in conclusion: "It is: 1st, The largest in average size of any berry that grows; 2nd, It will bear more berries, in number, than any of the large varieties; 3d, It is the latest berry grown; 4th, It is as desirable for shipping as any known; 5th, It is very fine-flavored, and the plant is a luxuriant grower."

I suppress the full address of the originator to save him unnecessary correspondence, as I am given to understand that, at least at present, he has no plants to be disposed of. I am promised next year, specimens of the fruit in its season, when I may take occasion to speak of it from personal observation.

THE IDEAL STRAWBERRY.

FROM a private letter from Secretary GARFIELD, we take the liberty of extracting the following—forcible as it seems to us—remarks:

"I wish the men who are at work improving the strawberry would have an ideal berry in view, and work toward perfection in something better than mere size. For the home or family use we need not look very much to the firmness of the berry; but we want fair size and the best quality we can secure in the fruit, and to this should be added a comeliness of form and hight of color that will attract the eye of an artist. The newer berries are lauded principally for their size, as if this were the main consideration. I like size; but when quality is sacrificed, magnitude is below par. The strawberry is a luxury, and I believe in combining in it as many good qualities that please the senses as we can get. I get just as much eye satisfaction out of a fruit as out of a flower. The other day I found, in Mr. Parmelee's orchard at Old Mission, the most beautiful specimens of Red Astrachan apples that I ever saw. I brought them home and placed them on the mantle shelf. They were as delicious as they were beautiful, and I was laughed at by my family for leaving them until past prime for eating. But I had greater pleasure in the lengthened eye-satisfaction than I would have enjoyed in gratifying the taste. So in strawberries: it seems to me in many of the newer sorts we have neglected the real elements of beauty, in getting size simply, or flavor simply.

One point more is not thought enough about, and that is, "What constitutes the best flavor?" Almost all will hit upon the same form as the ideal, but just what gives the best flavor is not thought about so much. My own impression is that the acid of the strawberry is not given enough credit. People make wry faces and cry "sour berries!" when the sour in a well ripened berry gives it the tone. The fact is that the firm berries are those which are the longest ripening throughout the mass, and the market berries are decried as sour when they are simply green and not modified by perfect ripening.

Arboricultural.

ARRANGEMENTS OF SINGLE TREES.

SINGLE trees or shrubs are the great sources of variety in a garden or lawn where the surface is flat and without any other objects of note, and, moreover, they are, when judiciously disposed, valuable additions to a surface naturally varied by undulations. The great art in putting down single trees, is to dispose them so as to form groups when seen from a distance, and yet so as to produce variety on every change of position of the spectator when near. To plant them thus judiciously requires much thought and attention, and in cases where the finest results attainable are desired, an experienced landscape gardener should be consulted.

The kinds of trees and shrubs thus employed may be varied at pleasure, provided some attention be paid to the general effect intended to be produced, and to the prevalence of one general form or character or disposition of trees or shrubs in one place. Thus, if conical trees be distributed equally, or injudiciously, over the grounds, along with round headed trees, they will produce great sameness; but if conical trees prevail in one place, drooping or weeping trees in another, round-headed trees in a third, and low-spreading varieties occupy another site, many distinct characters will be produced, and this will be much more interesting to the beholder than one continuous group of mixed trees of various habits. The same general rules apply with equal force to ornamental shrubs.

In planting single trees, care should be had to the proper soil: they should always be planted in prepared soil raised in heaps, a foot or more above the general surface, so that after a year or two, when the earth has settled, as it will to a certain degree, the tree may stand on a little hillock. The trees, before planting, should be ten or twelve feet in hight, with trunks three or four inches in diameter at the surface of the ground.

A. M. VAN AUKEN.

CHICKEN COOPS.

NEXT in order is a description of a chicken coop, and, since while describing only my own, some might accuse me of plagiarism, I will copy H. H. Stoddard's description and avoid all risk.

"A chicken coop must be adapted to warm and cold weather, and especially to rains, be easily cleaned and made rat-proof, nights. The old-fashioned triangular pattern secures all this, and also gives the small chickens a chance to escape under the eaves from the feet of the hens. The size proper to accommodate a double brood is 2½x3½ feet upon the ground, with roof three feet from eaves to peak. A bit of scantling is fastened to each roof for a handle. The door is hinged to open upwards. There is at the rear a small door that will allow chickens to pass but not grown fowls. An opening for ventilation is made near the peak, and covered with wire cloth. Take inch boards, nail them strongly, planed side up, to the cleats, and clinch. Let each end of both cleats project three inches, and the outside edge of each, two inches. This is the movable floor, and must be of such size that the coop shall rest entirely on the cleats. Then, when the doors are closed, all rain is shed outside of the floor. When the doors are closed at night, leave the large one ajar, half an inch to an inch according to the weather, for the admission of air, and fasten it with wooden pegs stuck in holes in cleats—a precaution that will make the coop rat-proof.

"Once a week, after opening the small door and letting the chickens out, slide the coop slowly, lengthwise of the cleats, out of the way; then scrape the floor thoroughly and give a shoveful of dry dirt, and replace it.

"When the hens are removed from the chickens, the latter huddle together on the floor for some weeks; but when old enough to perch, the box is placed upon the movable floor and the coop placed upon the top of the whole—the box being of such size that the sides and eaves of the coop overlap sufficiently to shed rain. The box has two perches permanently fastened to it. This roost is perfectly rat-proof, and a bushel or so of dry dirt keeps it clean."

I also prefer to have, in addition to Mr. Stoddard's "fixins," a small door near the peak of the coop, on the back side, for reasons shown hereafter. As to

FEEDING CHICKENS,

my plan is not so complete as others, but as it raises fine chickens, I am satisfied. When first taken from the nest, I feed the yelk of hard-boiled eggs, chopped fine, one egg for each ten chickens, at each of the three times they are fed every day. For four days this feed is kept up; then I feed scalded corn-meal or boiled potatoes, with corn and oatmeal mashed with them while hot.

For a drink, I give the chicks skim-milk, if I can get it, and if not, pure water. For the first week the chickens are fed in dishes on the floor of the coop; after that their feed is placed away from the coop, and on rainy days I use the box, with some loose boards over it, to feed in. The feed and water for the hens are put in cups hung to the coop, out of the reach of the chickens. I feed my chickens three times a day till they are ten or twelve weeks old, after that only twice.

I never separate the sexes, for I sell off the cockerels as soon as they are large enough to make broilers, and they do no harm before that; those I wish to keep I put somewhere by themselves as soon as they begin to make trouble.

For lice, I put a drop of oil on the head of each chicken when taken from the nest; and, when they are older, if one appears badly off or poor, I catch it and put some kerosene on its head and under its wings. To prevent gapes, I always give fresh water or skim-milk, and the ailment is unknown here. Cholera I never had a case of, for by keeping a few rusty nails in the water, I think it is kept off. The iron in the water also gives the Brahmas more strength of bone, which their large bodies require, and I have but few fowls going around on their second joints in the fall. By this plan of feeding and of shutting up my chickens at night, I do not lose one chick in twenty of those hatched.

POULTRY RECORD.—The following is my egg record from March 1st, 1878, to September 1st: Number of hens, 44; breed, White Leghorn, a few crossed with Light Brahma to sit. Their feed consisted of three quarts of buckwheat; corn, or oats, twice a day, from March 1st to May 1st. From that time on two quarts once a day, with old plaster and running water at hand, and an unlimited range for foraging, which they have taken advantage of. My fowls are not poor on this fare, but would make a presentable appearance if dressed for market. Probable cost of feed, $8. Eggs, sold 227 doz., eggs used in family, 74 dozen; eggs set, 7½ dozen, total, 308½ dozen. Proceeds of eggs at 11 cents per dozen, less feed, $25.94.

I have tried other breeds, but consider the Leghorn the model fowl for the farmer. I have hatched chicks from other breeds, the present season, but lost them all from disease, which the Leghorns only were able to withstand. Their only faults I have found are the requirement of warm quarters in winter, in order to produce eggs plentifully, and their liability to do damage in gardens, grain fields, etc. If any one can beat this on the same care and feed, let's hear from him.

ANON.

Ithaca, N. Y.

Miscellaneous

WHAT OTHERS SAY.

DIS-HORNED CATTLE.—In the London Agricultural Gazette, Mr. J. J. Mechi says that he purchased two lots of these animals, supposing them to be home-bred polled cattle, and every farmer who saw them concluded they were so; but one day an Aberdeen farmer of 800 acres, who fattens 260 cattle annually, said that they were Irish, and their horns had been removed, and that it was a common Irish practice to remove the horns from their well bred cattle intended for the English markets. He also said that as an extensive buyer of Irish cattle, if they came to him horned, he removed the horns, finding it advantageous to do so; and Mr. Mechi quite agrees with him; for, unlike the Irish cattle generally, he finds them quiet, good-tempered, and good doers. He saw that a dealer was heavily fined for cruelty in removing the horns, and asks would not this rule apply to castration and cropping of tails from sheep? The matter, he thinks, requires ventilation. The absence of horns is certainly a considerable advantage to agriculturists.

GARDENS AND GARDENING.—"I am extremely desirous," says the ex-Premier of England, Mr. Gladstone, in his recent speech, "that this pursuit should be propagated and extended among you. I love it for its own sake; it is delightful to see the country smiling with cottage gardens; it gladdens the eye and it gladdens the heart. Unfortunately, a great many of our modern pursuits tend to make this earth, which God has made so beautiful, abominable and ugly. Now, a garden, besides being beautiful itself, is a sign, a symbol of good habits; for example, in the first place, those who keep their gardens tidy and nice will try to have their houses tidy and nice; and if a house be poor, much depends upon those who inhabit it, for a poor house inhabited by a tidy woman is often more eligible than a superior one inhabited by one who is not tidy. You know how important it is that a house and everything about it should be tidy—how much it has to do with the peace and comfort of a family."

IN BEHALF OF HORSES.—Mr. Crandell says, in his department of the Weekly Tribune, that a horse-owner, favorably circumstanced, may save bushels of oats nowadays, and a goodly percentage on the blacksmith's bill, by making the stable dark so that the flies do not torment the horses. If the stable has blinds which can be readily closed in the daytime, well; if not, cloths hung up before the windows, which would shut out the sunlight, would answer as a substitute. Stamping to beat off flies is wearing to horses and loosens their shoes and often breaks their feet. It strains the cords and produces splints and puffs. A cheap blanket of cotton cloth will protect the body of a horse and pay for itself in a week, especially when horses are plowing or working at anything in the sun. Rubbing them over with smart-weed or walnut leaves or tansy or kerosene will keep flies off for a day; only a few drops of the oil must be used or the hair will be injured and the skin made sore. Blankets are the best.

Dis-horning Cattle.—In reference to articles on this subject, in the columns of the London Ag. Gazette, one of which we copied last week, a writer says that the quietness in demeanor of dis-horned cattle arises from fear of injury to the weakened defenses of the head. The gouge or the saw are the usual implements employed in this process—the former for youngsters, and the latter for adult cattle. The root of the horn is a most sensitive part, and any violent interference with it is a cause of intense pain, as is evident on witnessing the accidental wrenching off of a horn. If the operation of dis-horning is carelessly or unskillfully performed, the blood oozes and drips for several days, and not unfrequently the wound becomes fly-blown, and, unless promptly attended to, the animal is lost.

The man who saws off or gouges out an animal's horn deserves a somewhat similar experimental application to his own scalp.

Whitewash for Trees.—Mr. Meehan says that whitewash is frequently resorted to by farmers, but the great objection is its unsightly appearance—the result is otherwise good. The great opposition to washes formerly was, that the pores of the bark were closed by them—this was on the supposition that the bark was alive, but the external bark of most trees has been dead years before the time of application; and 'the breathing,' if so the operations of the pores can be called, is through the crevices formed in the old bark by the expansion of the growing tree, by which the living bark below has a chance of contact with the air. No matter what kind of coating is applied to the bark of a tree, it will soon crack sufficiently by the expansion of the trunk to permit all the 'breathing' necessary.

Respecting the unsightliness of whitewash upon trees, why not adopt the Rural's plan of adding red mineral powder and lamp-black to the whitewash? The color of the bark may in this way be so closely imitated that the wash will not be observed.

Seed Wheat.—"Any man," says J. B. Kellebrew, "who will establish in his garden an experimental plot, can select the best heads of the most prolific wheat, sowing the next year the best heads alone, and still selecting from this the best heads, using the balance for field use, and in this manner keeping always one year ahead. This will make good seed. A practice that has resulted in a largely increased production has prevailed in some sections, and merits special mention:

"Select a few bundles and strike them over the head of a barrel lightly. The heaviest, best matured grain will fall out, leaving those not fully ripe in the bundle. A few minutes will suffice to secure, in this manner, seed that will improve the ordinary yield very largely. This proves the necessity of seed wheat being allowed to get fully ripe before cutting."

Grass Dressing.—A writer in the London Farmers' Chronicle, who had just visited Mr. Lawes at Rothamsted, says that one plot of the experimental grass is heavily dressed with wheat straw cut into fine chaff. It was seven years before the slightest benefit was perceptible from the yearly application of this chaff. From that time to this a decided improvement has been manifested. This is consoling to common farmers. The great bulk of our farmyard manure is composed of straw in a more or less rotten state. Consequently it is many years before the whole value of a coat of farmyard manure is exhausted, whereas the nitrogen in the artificial fertilizers is gone in a single season—possibly some of it with the first heavy rains of spring.

Dr. E. Lewis Sturtevant, the able editor of the Scientific Farmer, holds that the farm is a manufactory as well as a farm, and after the normal capacity of the soil is attained by rendering available its real resources by good culture, he would buy the raw material of plant food at a low price, and convert it into farm products of a higher value, thus making a profit in the conversion, and the larger the quantity of material thus converted the greater the gain in the business.

Feeding Young Chicks.—But few are aware for what a length of time chicks just hatched out, may be left unfed without any detrimental effect. A writer in the Berlin *Presse* communicates to that journal a well-marked case in point. In the course of the summer a newly-hatched brood of his chicklings were accidentally overlooked for three days and nights, and yet at the end of that time were found well and active, and quite as large and strong as others of exactly the same age that had been fed, according to his usual practice, about thirty hours after leaving the shell.

Care of Fruit Trees.—Mr. Charles Downing tells the editor of the Weekly Tribune that it is quite surprising, to those who have not tried the experiment, what thinning out the top, scraping, and washing with potash, the trunk and large limbs, and digging up and manuring the soil, at least so far out as the branches extend, would do for even a very old apple tree—seemingly past help.

English Sparrow.—A writer in the Indiana Farmer says: "Your pestiferous English Sparrow has found its way into our cabbage patches and has cleaned out the more pestiferous cabbage worm."

A Good White Shirt, at the extremely low price of 60 cents, or two or more for 50 cents each by mail, post-paid, may seem so improbable as to suggest a fraud of some kind, but manufacturing in large quantities, of regular standard sizes and selling them directly to the wearer with no intermediate or middlemens' profits, will in a measure explain how such a thing can be done. The shirts advertised in our columns are really well-made, from good, substantial materials, and any one can convince himself of the genuineness of the offer and the full value of the article by remitting 60 cents for a sample shirt. To borrow an expressive Western phrase, no one need now be without a "biled shirt," when they can be had for this low price. The makers of these shirts, the Newark Shirt Co., are responsible, and will send goods fully equal to the value of the money, and one shirt will certainly make many new customers without further argument.

To Expel Foul Air.—The quickest way to expel foul air from a well is to heat a bar of iron red hot, and lower it down into the water; the sudden formation of steam is effectual.

James Vick, Rochester, N. Y. Floral Guide for autumn. One of the best and most instructive autumn catalogues published. Everything needed for the garden with plain instructions. Accurately and fully illustrated.

Premium List and Regulations for the Thirty-seventh Annual Exhibition of the Queens County Agricultural Society to be held on the Society's Grounds at Mineola, L. I., Sept. 24–26. J. Howard Rushmore, Old Westbury, N. Hempstead, Sec'y.

John Saul, Washington, D. C. Descriptive Catalogue of Hyacinths, Tulips, Crocus, Narcissus, Lilies, and other bulbous flower roots with a choice selection of winter-blooming plants for autumn, 1878. This is sent gratis to all applicants.

House-plans for everybody for village and country residences costing from $250 to $8000, including full descriptions and estimates in detail of materials, labor, and cost, with practical suggestions and 175 illustrations, by S. B. Reed, architect, published by the Orange Judd Company, 245 Broadway, N. Y. This is chiefly a compilation of various house-plans which have appeared during the last three years in the American Agriculturist. They embrace almost every variety of arrangement and style, and to professional builders as well as to private parties intending to build, it will prove a valuable handbook of reference.

Biographical.

J. J. MECHI.

Probably there is not a farmer that reads an agricultural paper, or one who strives to improve his farm, or one who is in anywise really interested in his pursuit, that has not heard of the genial, enterprising owner of Tiptree-Hall Farm. From memoranda and journals which Mr. Mechi has kindly sent to us, we have compiled the following particulars of his life and farm, and we are confident that they will be read with a keen interest by American farmers.

J. J. MECHI.

Mr. John Joseph Mechi was born on May 26, 1802. In 1819, after two years' education in France and a further education upon his return to England, at the age of 17 he entered a merchant's office in London. After remaining there eleven years he commenced business for himself. Of this part of his life the Stock Journal remarks: "He soon saw that enterprise begets success. He lived in the early days of advertising, and his success was greatly due to the fact that he embraced all the facilities which the new movement offered. London woke up one fine morning, and found itself plastered all over with bills announcing the excellence of Mr. Mechi's wares. This brought many customers, and Mr. Mechi's personal care was that those customers should be perfectly satisfied. Not so very long ago he said to the present writer, "I always endeavored to satisfy every person that came to me for business. If a schoolboy came to me for a pocket-knife, I always did my best to help him to choose a good one, and I always told him that if it did not suit him or he did not like it, I would willingly change it. The result was that the majority of those casual customers, brought to me by advertisements, became regular customers, and continued so."

Mr. Mechi's agricultural life commenced in 1841, when he purchased Tiptree farm, at a cost of £25 per acre, as we have already told our readers. He at once set about improving it. He removed fences, adopted a complete system of drainage and irrigation, made good roads, and erected new and suitable buildings with steam-engines and new and improved machinery. In 1843 Mr. Mechi wrote his first letter on agricultural matters:—"I may be asked," said he, "what can you as a Londoner know about farming?" I will answer, "I always love the beauties of nature, the pure air of heaven, the sports of the field, and the hospitality of our honest yeomen. I have seen one farmer making a fortune, and his next neighbor losing one. I have seen one field all corn, and another nearly all weeds. I asked, 'How is this?' inquired into the causes, noted the results, obtained from all the best farmers and all the best agricultural books within my reach, every information bearing on agricultural pursuits, practised in my own little garden, on a small scale, a variety of experiments—and, after carefully weighing the evidence, I came to the conclusion that want of drainage, waste of manure, shallow plowing, and short leases, are among the greatest curses to this country; and I, as far as my individual means will permit, am resolved on remedying them."

Time has proven that the above was not a mere flourish of words. Mr. Mechi stuck to his programme. For nearly forty years he has been telling all who cared to listen to him that British agriculture requires more capital invested in it, in order to properly develop its resources, and in order to get that additional capital, greater security should be given for all the money invested.

"On Tiptree Heath," he says: "with soil much below the average for the United Kingdom, I grow crops much above the average of the United Kingdom. Here is a table of the percentage of the crops—which enable me to produce three times the quantity of food per acre that is generally the case in this country—on my poor farm of 175 acres, and of the 47,000,000 acres of the United Kingdom.

Percentage grown of	United Kingdom.	Tiptree.
Wheat	8¼	37
Barley	4½	12
Oats	8½	3½
Peas and beans	2	12
Root and green crops	11	8½
Clover and grasses	12½	20
Permanent pasture	50	4
Bare fallow	1	0
	98	97

"These results have been obtained in consequence of my having security for my capital, and by my having sufficient capital to farm profitably. We want liberty and security, if the most is to be made of our land."

We have read that Mr. Mechi's name has been received with hisses and groans in many an agricultural gathering, and yet he has gone on in the path he has marked out for himself without once losing his temper or saying an angry word. But if all his theories and practices had been wrong, one of his actions has brought many a blessing to reduced farmers. We allude to the founding by him of the Royal Agricultural Benevolent Institution, a charity which is this year distributing annuities amounting to nearly $55,000 to destitute farmers, farmers' widows, and farmers' orphans.

As a writer, Mr. Mechi has a style at once pleasant and forcible. His agricultural "Sayings and Doings" are recorded in three volumes, entitled, "How to farm Profitably," and another volume, the last, will shortly be added.

Our portrait of Mr. Mechi is an excellent representation of one which was published in the London Live Stock Journal of July 26, from a recent photograph.

Floricultural.

BLUE, WHITE, RED AND YELLOW POND LILIES.

Mr. Jas. H. Campbell of Toledo, Ohio, apropos of Mr. William Falconer's article on the above subject in Rural for August 17, page 521, says:—"I dispute the possibility of three primary colors existing in any one species of plants. Two colors and their combinations are seen in Roses, Verbenas and various others, but the complimentary color is always absent. Red and yellow Roses with their combinations, are common, but a blue Rose is an impossibility. A yellow Verbena, being complimentary to the red and blue, is also an impossibility."

And he says to Mr. Falconer, "Bring on your proofs of three primary colors in one species."

In reply to this challenge Mr. Falconer writes:

"Permit me to inform Mr. Campbell that what I stated as regards white, blue, red and yellow-colored pond Lilies (Nymphæa), I emphatically assert as truth, and I defy him to refute the existence of any of the species I mentioned. In fact, if he comes to Cambridge I will be pleased to show them to him; but if he finds that inconvenient, I refer him to the botanists of Harvard University,—Dr. Asa Gray, Prof. Sargent. Prof. Goodale, Sereno Watson and Dr. Farlow, gentlemen whose veracity is indisputable.

Mr. C. says:—"I dispute the possibility of the three primary colors existing in any one species of plants." Would readers of the Rural kindly refer to my article on "Pond Lilies," and see for themselves if I said the Pond Lilies in question were members of one species? No, I spoke of the blue, white and yellow-colored ones as distinct species, and the red one as a hybrid between two other species. Surely that is plain enough to the merest tyro? But they all pertain to one genus, namely, Nymphæa. Therefore I recommend that, if Mr. Campbell does not know the difference between a genus and a species, he should consult some "School Botany" before he dabbles in botanical challenges.

Nor is the genus Nymphæa alone in having so variously colored flowers; blue, red, yellow and white occur in Columbines, Anemones, &c.

Mr. Campbell concludes by—"Bring on your proofs of the three primary colors in one species." Yes, sir. Did you ever see red, blue, yellow and white-colored common garden Hyacinths? If you have not, I have, and so have millions of people besides me; and those variously colored Hyacinths all belonging to one species, namely, Hyacinthus orientalis.

William Falconer.

Botanic Garden, Cambridge, Mass.

Okra.—The Okra plant at this season assumes quite an odd and pretty appearance. The flowers are like the Hollyhock. This is one of the plants we should recommend to ornament the vegetable garden.

The Querist.

ANSWERS TO CORRESPONDENTS.

Results of a Small Capital on a Farm in the Far West.

E. F. N., Bucyrus, Ohio, asks what a man with a small capital can do, if he invests in Western lands with a view to farming?

ANSWER BY S. J. GILMORE.

The following figures, illustrating what an industrious, energetic man, with a cash capital of $700 to $1,000, can do in Central and Western Kansas. The lands of the Kansas Pacific Railway in this region are sold at from $2.00 to $6 00 an acre. Good average land can be bought at $3.50 per acre, and the net price on six years credit would be $3.15. The cost of 160 acres would be $504 and the payments would be as follows:

Payments.	When due.	Principal.	Interest.	Total.
1-5 cash down.	Nov. 1st, 1878	$100.80	.....	$100.80
First.....	" 1879	.....	$28.23	28.23
Second.....	" 1880	.....	28.23	28.23
Third.....	" 1881	100.80	28.23	129.03
Fourth.....	" 1882	100.80	21.17	121.97
Fifth.....	" 1883	100.80	14.11	114.91
Sixth.....	" 1884	100.80	7.05	107.85
Total.....		$504.00	$127.02	$631.02

The outlay would then be as follows:

Cash payment on land.....	$100.80
Cost of neat two-room house, well plastered and painted (this can be reduced to say $50.00 for a cabin).....	250.00
Furniture, stove, etc.....	35.00
Yoke of oxen.....	80.00
Wagon—new.....	70.00
Plow, harrow and other tools.....	40.00
Cow and chickens.....	50.00
If he comes in the early spring, the cost of living for family of three adults till he can get vegetables, potatoes, seed-corn, etc., for five months, would be about.....	75.00
Meanwhile he can break and sow, say 40 acres wheat, cost of seed.....	25.00
10 acres of rye, "	4.00
Add incidentals, interest, etc., till he can sell his crops of wheat and rye, say.....	125.00
Total.....	$834.80

And during the year he should be able to earn from $100 to $200, by breaking land, harvesting, etc., for his neighbors.

During the second year, he should realize, crop 40 acres wheat, 20 bushels to the acre, 800 bushels at 60c.....	$480.00
Do., 10 acres rye, 15 bushels per acre.....	36.00

(Both of the above are put at very low prices—wheat for several years having sold here for 80c. to $1.10 per bushel.)

During the months of May, June and July he can break with *two* teams, say 50 acres more of prairie, and in September sow 100 acres wheat, which should yield him, the third year, at least $1,200, with which he can pay in full for his land and have a balance left for a good house, stable, etc.; and his land would be worth at least double its cost. Everything seems to be favorable to a man of moderate means here and in the counties west. The climate is mild, the rainfall ample—but not enough to drown the crops; the soil a deep, rich limestone loam, very productive and enduring—wheat averaging 20 bushels to the acre—this year averaging 23½ bushels, and in one instance 60 bushels per acre. In addition, the markets for the sale of his crops are good, churches and schools are abundant, and society much better than in any other new country.

Seed Corn from Tips, Middle and Butts of Ears.

A. H. W., Mass., asks with regard to selecting seed-corn; should the top or bottom ears be taken, when two or more ears grow on the same stalk; should the corn be taken from the middle or ends of the ears, and, if from the ends which one is best.

ANS.—In answer to this inquiry, we find the following experiment with corn, on the University Farm, Wis., recorded in the "Transactions of the Wis. State Ag. Society" for 1871, "Seed from Tips, Middle and Butts of Ears. Three plots of equal area were planted on May 6, from seed grown in the same manner in 1870; distance apart three by four feet; three grains to the hill; of New England variety. Cultivation uniform in all. The results are shown in the following table:

Seed from	Time of ripening.	Yield pr acre.	Average length of 25 longest ears.	Average circ. at butts of 25 largest ears.
Butts.....	Aug. 21	62.66 bu.	9 inches	6½ inches
Middle.....	Aug. 21	60.95 bu.	9.1 inches	6 inches
Tips.....	Aug. 21	58.11 bu.	9.2 inches	5.8 inches

No difference was visible in time of ripening, but in the yield a perceptible difference was shown in favor of seed from the butts of the ear. The results of the measurements are quite curious, indicating that the average length of the ears was greatest in those raised from seed from the tips, while the average size around the butts, was greatest in the product of seed from the butts of the ear. In each case, as well as in the yield per acre, the product of seed from the middle of the ear was a mean between the other two.

This experiment seems to indicate that seed from the butt of the ear produces the greatest yield. It is not well, however, to establish this as a rule by the results of one, or even a few trials. If farmers in different localities, would repeat the experiment, with different varieties of corn, for a series of years, and compare results, then conclusions might be drawn that would be safe to follow.

Nephila Plumipes.

D. H. Elliott, Suwannee Co., Fla., sends specimen of insect found on his farm and asks for its name and history.

ANSWER BY DR. J. A. LINTNER.

The insect sent is the large and beautiful spider, known as Nephila plumipes (Koch). It is the one which a few years ago (in 1865), excited considerable interest, from observations and experiments made upon it by Prof. Wilder of Cornell University, who entertained the belief that the silk from it could be obtained in sufficient quantity to be utilized in the manufacture of silken fabrics.

The spider is one of the largest of its family, measuring, in lateral expanse of legs, two inches and three-fourths, and in longitudinal expanse, three and three-fourth inches. Its body is an inch and one-fourth in length, having a black thorax covered with silver-gray hairs, and an olive-brown cylindrical abdomen marked with white and yellow spots. Its first, second and fourth pairs of legs have on their second and third joints whorls of thick-set, stiff, black hairs.

Prof. Wilder first met with the spider on Folly Island, North Carolina. In a paper read by him before the Boston Society of Natural History, October 4th, 1865, he states: "As it stood quiet near the top of my tent, I wound off silk upon a quill for an hour and a quarter at the rate of six feet per minute, making four hundred and fifty feet in all." Subsequently, from an example taken upon Long Island, west of Folly Island, by means of a gear drill stock with cog wheels, Prof. Wilder succeeded in winding, directly from the abdomen, three thousand four hundred and eighty yards, or nearly *two miles of silk.* He states, during a two years' stay on the coast, and in the interior of South Carolina and Florida, he had not met with any trace of this spider elsewhere than near Long Island. The spiders are found in the forests, building their webs between trees and shrubs. The web is very large, from three to four feet in diameter, quite strong and very vivid. Its frame-work is composed of silver-colored silk, and the concentric circles of a bright yellow or golden-colored silk. In these webs large and vigorous insects are captured, as cicadas, etc., which the spider first envelops in a net by turning them over and over, before she proceeds to extract their juices.

Prof. Wilder was, subsequently, able to make additional experiments upon this insect, which were published, but the papers I have not at hand. From my recollection, a sufficient quantity of the silk was obtained to test its quality in the manufacture of some small article. But as there were found some insuperable difficulties in the way of rearing the spider extensively, the attempt to render it of economic value proved a failure.

The spider is figured in the Proceedings of the Boston Society of Natural History, vol. x, p. 210, where the male—quite a diminutive creature—is also represented.

N. Y. State Museum of Nat. History Albany.

Miscellaneous.

M. B. P., Brookston, N. C., sends for name, flower, leaf, twig and ripened seed of a shrubby tree, in that neighborhood called Bay-wood. It grows plentifully in wet places, along streams, etc., sometimes to the hight of 20 feet or more. Hitherto he has, with this exception, never noticed flowers on it at any time, except in early summer, and has never seen many fruit maturing.

ANS.—It is Magnolia glauca.

W. W. Peck, Colebrooke, Astabula Co., Ohio, asks where he could buy a pair of white mice, and how much they would cost.

ANS.—White mice can be bought of R. W. Zoller, 5 North William St., N. Y. City, for 50 cents per pair. Mr. *Z.,* however, states that he would not ship one pair at any price.

G. M. Bowman, McKeesport, Pa., asks the names of the plow manufacturers in New York State, who make the most popular plows?

ANS.—Syracuse Plow Co., Syracuse, N. Y.; New York Plow Co., N. Y. City; Wiard Plow Co., Batavia, N. Y.

WESTERN NOTES.

OGLE Co., Ill., Aug. 27, 1878.

SINCE the harvest has closed "Ye Grangers" of the West have been busy threshing their crops, or preparing to do so, hauling manure, etc., and some few have commenced plowing. Thus the farm-work goes on without cessation, and there are many, many things not in the regular routine or programme that must be attended to when opportunity is offered.

ORDER—the first law of Nature,—should be the leading principle with every farmer. It pays to be methodical and keep things in good condition and proper shape. There has been more money lost in agriculture by wastage, slip-shod farming, and inattention to business, than would be required to pay off the public debt and release every mortgage in the land! This may seem a rather extravagant guess, but the facts in the case would no doubt sustain the assertion. Too much begun and too little done is the cause of many a misfortune and failure. Under a too heavy load but little progress can be made, and the carrier is soon broken down. Let no one undertake more than he can accomplish in due season and in a right manner, and success will crown his well-directed efforts.

ODD JOBS, and there are many of them, cannot be mapped out for set times, but must be transacted at the most opportune moments, and in a manner that seems the most feasible. The thoughtful farmer will be at no loss to know how to regulate these little irregularities, so as to bring order out of chaos, and make or save a little "honest money." Among the numerous odd jobs that present themselves when least expected, are repairs to fences and buildings; the mending of gate hinges that have been broken from "too muchee swingee;" the destruction of noxious weeds before they go to seed; the demolition of the nests of tent-caterpillars on fruit trees—"let no guilty one escape;" the removal of water sprouts; and many other things "too tedious to mention," will be found for industrious and willing hands to do.

HARVEST HOME pic-nics and recreations are highly appropriate at this time of year. After the hard, toilsome work of harvest, through the long, sultry summer days, the body needs relaxation and rest, and the mind some social enjoyment other than can be obtained in our daily avocations and in the seclusion of rural homes, however pleasant these may be. As seed-time follows the harvest, it is well to pause and contemplate the beauties of Nature, and the mysterious ways of an all-wise Providence in the productions of the earth. *Apropos* of this, allow me to quote a beautiful sonnet on "Life," from "Galileo and Other Poems," by J. P. Johnston, of Bennett, Pa., which I have no doubt will awaken an echoing strain in many a concordant heart:

"I stood amid the ripened field of corn,
Which covered all the bright and smiling land;
And saw the reapers come, a happy band,
With merry songs upon the breezes borne.
And glad and joyous shoutings, 'mid the bright
And balmy air, which seemed to bear no blight.
I said, 'All nature lives, shall man despair?
Shall fruitful seeds, which long had darkly lain
Beneath the sod, revive and bloom again,
And man be left to sleep forever there?
Beneath the sunshine of a future age;—
Who knows? perchance a brighter hour may come,
When storm shall pass, and tempest cease to rage,
And man arise to shout the world's great Harvest Home."

AGRICULTURAL FAIRS are now about to be held throughout the different States, and most of them give promise to be of unusual interest and unprecedented attraction. This season is auspicious for them, as the crops are bountiful, live stock in general good condition, and manufactures have attained an eminent state of improvement and perfection. Our Western fairs will be found of special interest and value. The Minnesota State Fair, at St. Paul, promises a useful novelty in the exhibition of the process of making sugar from corn-stalks. This will be a practical test, as it is proposed to manufacture and granulate sugar in the presence of the public, from corn-stalks. Stowell's Evergreen, and a species of Chinese sugar-cane have proved to be the richest in saccharine matter, so far as tested. The leading feature in the machinery department of Western fairs this year will again, most likely, be the various self-binders that will be exhibited. Some of these labor-saving machines now do their work automatically with astonishing neatness and dispatch. But all kinds of implements and machinery will be exhibited in bewildering profusion. The Exposition at Chicago, under the efficient management of Hon. John P. Reynolds, Secretary, will be open from Sept. 4 to Oct. 9, and will be a busy hive of industry. More applications for space, from the East, as well as from the West, have been made than could well be accommodated in the spacious Exposition building, but all will receive due attention.

I also learn that the managers of the Illinois State Fair (to be held at Freeport, Sept. 16-21,) are enlarging their accommodations, by the erection of additional booths and buildings, etc., as numerous applications for space and letters of inquiry are being received by Secretary S. D. Fisher, Springfield Ill., from all parts of the State and elsewhere, indicating a large attendance and fine show. Let IMPROVEMENT be the aim of all our fairs, and success, both present and prospective, will result therefrom.

Truly these are encouraging "signs of the times." W. B. DERRICK.

NORTH CAROLINA NOTES.

TRANSPLANTING TREES.

HAVING had some little experience in transplanting evergreens, I may be pardoned for telling the conclusions I have arrived at. But very few losses need be sustained where one not only plants his trees himself, but lifts them from the nursery rows also. Too often by far trees are in fit condition only to go on the brush heap when received, the death-blow having been dealt when Pat grasped the top and pulled with "might and main," while Mike thrust his spade in the earth, loosening the tree, and at the same time putting in practice to excess the theory of root-pruning. Again, in packing too little moss or other damp packing is used on the roots, and three or four days' exposure to dry winds results, in many cases, in the conclusion expressed by the amateur planter in the hopeless words: "It is useless to plant on my soil."

My practice has been to procure trees as nearby as possible, preferring an inferior specimen handled under my own eye, to better ones handled as above described. As to the time, I have never been successful in the fall, but would not hesitate to fill an order any time after the frost is sufficiently out of the ground in March until July. Unless the soil is quite wet, give each tree a bucketful of water about the roots, then with the spade cut around about a foot from the stem, more or less according to the size of the tree; have ready at hand a sufficient number of boxes, 18 to 24 inches square, the sides being only two or three inches high. If one side be left open it is more convenient. While one man lifts the plant carefully, another loosens with the spade the ball of earth which, if the soil be any way tenacious, the fibrous roots will hold together until it can be placed in the box. It is very easy to slide the mass into the hole prepared for it. If all be carefully done, the growth will not be retarded and no replanting is required When desiring to plant trees from the woods or fields, I have found it more satisfactory to cultivate in nursery rows one or two years before planting out singly.

TO DESTROY BURDOCKS.

Mr. Bertram's failure to destroy burdocks by cutting was no doubt attributable to too early cutting. Allow them to make a full growth, getting nearly ripe, then cut, gather together, before the seed is dry enough to shell out in handling, and burn. This plan followed, two years in succession, will leave but few, if any. The burdock is a biennial, producing no seed until the second summer, after which the plant dies. If cut before fully developed, cheated nature persistently exerts herself in the re-production of burdocks, throwing out shoots as often as destroyed, and well set with seed, until frost ends the struggle; whereas if allowed to mature the first crop they die easily.

M. B. PRINCE.

FARM NOTES FROM CENTRAL NEW YORK.

ITHACA, Tompkins Co., N. Y., Aug. 31, 1878.

CROP REPORT.—Corn will be fully up to the average. Early potatoes poor, those planted later, a fair crop. A large amount of hay gotten in, in poor condition on account of the unfavorable weather. Hay worth $6 to $7, per ton; white wheat, $1, per bushel; potatoes, 32 cents per bushel. Weather fine at present, with a good prospect for the buckwheat crop.

HEN MANURE ON CORN.—I think I have found the most profitable way to use hen manure on corn crops. My plan is as follows: Let one man go ahead of the planters, and drop a small handful in each hill; let the planter, before dropping the corn, cover the manure slightly with earth; then drop, and cover as usual. Try it once, and you will find your poultry pay in their droppings alone.

RURAL SPECIAL REPORTS.

PLYMOUTH, Wayne Co., Mich., Aug. 24.

WHEAT, on the whole, is an unusually heavy crop, yielding in some instances, forty-four bushels to the acre; where not injured by rust the average would be about twenty-five bushels. Quite a number report thirty and over. Some few complain of too much straw and very small heads.

OATS have been a source of trouble to the farmer all the season. The land intended for them was plowed one day, and then lay off nearly the whole of May, and, except on light land, very few were sown before the first week of June. The majority headed out when about eighteen inches high and are, on the whole, a light crop.

HAY was not an average crop, the May frosts having injured it considerably.

STRAWBERRIES considerably injured by frosts and finished off in a drought, very short season and light crop.

RASPBERRIES, full crop and fine fruit.

GRAPES nearly all cut down in May; a very light crop will be gathered from the second growth.

APPLES, various; some orchards in good bearing, others medium to very light. May frosts doing serious damage in some situations.

PEACHES, on the whole, are a light crop, but fruit is fine. The extra area sown will, in a measure, compensate for the lack of yield.

POTATOES will be a fair crop. They vary much both in quality and quantity and, at the present time, the average yield can scarcely be determined. I have Early Rose, Late Rose, Snow Flake, Brownell's Beauty and Peach Blow. The three first I have tried, and they are the best in quality of all I have tasted in North

America. I often regret I can't eat more. They are not only like balls of flour, but they have a delicious flavor indescribable.

This season has been a most remarkable one here. No severe winter weather; strawberries in blow the last week in March and half the crop destroyed by frost two months afterwards. Long, dry, hot spells followed by almost tropical rains, the wind invariably veering to the north for a day or two after rain. Vegetation has suffered more without rain for one week than it has some seasons without it two weeks. The sun has scorched the leaves of plants and dried them up as if actually burnt by fire. The colors of Geranium flowers were quite changed; salmons were nearly scarlet; scarlets, crimson Lucretia nearly rose-color, and I had to refer to the label to know which one I was looking at. Other plants I cannot coax to flower at all, while others almost refuse even to grow; but Hydrangea paniculata is bearing the largest flowers I have seen—they are immense.

J. H. J.

CHARLESTON, Kanawha Co., W. Va., Aug. 31.

AFTER reading the "Crop Reports" in the RURAL, and comparing the other States with W. Va., I find she is about on an average with the rest. There certainly cannot be any complaint about small crops, for the prospect was never better for an abundant harvest. If the production of an abundance of grain will in any way relieve the poor and hungry that are crowded in the large cities and towns, they will certainly get relief this winter.

We are having a good deal of rain here now. For the last month the ground has been too wet to plow, and consequently the weeds are taking possession of the farms and gardens, and about the only remedy is the scythe. Speaking of a scythe reminds me of mowing, I suppose on the same grounds on which the old woman said speaking of shooting reminded her of a gun. If the scythe and mowing machine were used more, the meadows would undoubtedly be better. After the grass is cut and stacked or handed into the barn—which is still better—the farmer, as a general thing, turns in his stock to pasture, and, of course, the cattle will eat the grass and keep it close to the ground, while the weeds have all the chance to grow, and in the fall they ripen and fall to the ground, completely covering it with seed, and in a few years the meadow is over-run with weeds and briers and the grass is not worth cutting. Now, this can be prevented if measures are taken in time. The reaper is the preventive, and if the weeds are mown down before they ripen, it will not only kill them but will be a good coating of manure for the meadow and pastures.

The potato bug has left for parts unknown, I suppose; for we are not bothered much more with it here. Potatoes were raised in good quantities last year, and consequently were very cheap, bringing only from twenty-five to fifty cents. As the price didn't pay for raising them last year, there were not so many raised this season. Strawberries were raised here in abundance this summer and brought, in the latter part of the season, only from five to eight cents a quart. The Champion was the best berry raised, some measuring from five and a half to six inches in circumference. E. B. D.

FREEDOM, Outagamie Co., Wis., Aug. 23.

WITH occasional heavy rains and warm weather, corn is making a big growth; it is earing out well now, although rather late. If the frost holds off long enough we shall have a large corn crop, as more than the usual area was planted last spring. Meadows and pastures are fresh and green. Clover is making a rank second growth, insuring plenty of fall feed for stock. Thashing is progressing rapidly now, and, in the aggregate, the wheat crop will be large owing to the large amount sown last spring. Spring wheat is yielding from ten to twelve bushels per acre; winter wheat about double that quantity. The quality of spring wheat is only second or third-rate. Oats will be about a medium crop; other crops, roots, &c., about as good as usual. Weather warm and wet. J. H.

BEWLEYVILLE, Breckenridge Co., Ky., Aug, 28.

THE corn crop in this county will hardly average half crop, caused by dry weather. In the last two months we have had scarcely any rain not enough to wet root crops. The night of the 2nd of this month a terrific hail storm passed through this section: doing great damage, to fruit, corn, and tobacco. Garden products were almost entirely ruined. Some have cut their tobacco off so that shoots will come out from the ground and will make trash. Wheat did not thrash out well, oats did well. Many, many thanks for the Willow slips; out of four I think I will save three. M. J. C.

NEOSHO Co., Kan., Aug, 24.

THE early corn is very good; late corn is injured by dry weather. Perhaps the average yield will be about 40 bushels to the acre. Wheat is good grain, but the yield will be small—15 bushels per acre. Oats good; 50 bushels per acre. Peaches, poor and wormy. Hay good. Wheat, 65 cents per bush.; corn, 20 cents per bush.; oats, 12 cents per bush.; butter, 10 cents per pound; eggs, 6 cents per doz.

WM. B.

The Herdsman.

WHAT CLASSES OF ANIMALS SHALL WE SELECT?

PROFESSOR G. E. MORROW.

IT is a generally recognized principle in breeding that it is exceedingly difficult, if not absolutely impossible, to combine, in any one animal or any one breed, the highest possible excellence in several directions. It is obvious that a horse best adapted for heavy draft is not best suited for fast trotting. Should one desire to purchase a horse possessing any one characteristic, whether of form, size, age, training, he could find what he desired with comparatively little difficulty, but to exactly mate a given horse is quite another matter, and supposing absolute agreement be insisted on, the effort would be in vain. It would be held absurd to ask for a horse capable of running a mile in 1:45, of trotting in 2:30, and of pacing in 2:25. This principle should be kept in mind by those attempting to improve a breed or class of animals. If the effort be made to develop a large number of desirable characteristics at the same time, the result will almost inevitably be failure.

But the recognition of this truth should not lead us to deny the equally evident one that a fair degree of excellence in two or more directions may be combined in one animal. A good driving horse may be a very fair horse for most ordinary kinds of work; a sheep giving a good fleece may also have a good carcass. There are certain characteristics which seem antagonistic, but there are many which, while having no special connection with each other, seem to have no antagonism. Thus most "fancy points" in our improved breeds are neither beneficial nor harmful in themselves. A bay horse is neither better nor worse, necessarily, than is a chestnut. A solid-colored Jersey cow is neither better nor worse because of this; a dark-nosed Short-Horn may fatten as readily and give as much milk as one with the fashionably-colored nose. It is harmful to make such points prominent in the objects for which we breed, as we probably will, in such case, neglect more important ones, but their possession is unimportant in itself. So, too, I can see no necessary antagonism between milk giving and flesh forming; between wool growing and ability to produce mutton in fair quality and quantity. Of course, I do not mean that these things can both be done to the fullest degree at one time.

I fully believe it possible, and not exceptionally difficult, to combine a fair degree of merit in two, three or more directions in the same animal and in the same breed. Not only so, but I equally firmly believe that such animals are best suited to the needs of the larger number of persons, and that their production or ownership is advisable for the great mass of farmers. This may be illustrated by referring to the effects of a minute division of labor. Undoubtedly this gives greater skill and efficiency. The man who has been thoroughly trained to do one thing, can do this better and more rapidly than can one who has given his attention to learning how to do a good number of things; but the latter is the more useful man in most communities. A skillful plowman is very desirable, but on most American farms one who only knows how to do this, would be an expensive luxury. In like manner, the average farmer or citizen does not need a horse, for instance, the best possible for any one purpose so much as one fairly adapted for quite a variety of work. On large farms teams may be kept for special work, but on the average farm of this country, the best horse is one fairly suited for the road and the plow, possibly for the saddle.

I grow more and more convinced that reasonable fitness for more than one purpose, should be insisted on in all breeds designed for general introduction among farmers. There are special localities, and special men in many localities, needing animals specially fitted for one special purpose, and fortunately such animals can be obtained. But nine farmers out of ten, taking the country as a whole, cannot afford to select any class of farm animals with reference only to any one characteristic. Activity and strength in the horse; beef and milk in the cow; wool and mutton in the sheep; early maturity and fair size in the hog—fair excellence in these combined qualities is a better recommendation for any breed, so far as adaptation to the wants of the mass of farmers is concerned, than is proof of remarkable merit in either one with confessed inferiority as to the others.

Accepting this view does not make it necessary to cast off the typical draft horse or the typical trotting horse; each of these has its place and meets a demand; but that place is not on the average farm. There are men who will find cows which "run all to milk," and neither in form nor size are well adapted to beef production, the most profitable; as there are many who only care to have their cows give enough milk to nourish their young; but by far the larger number of cattle-owners in this country will find those breeds and those families within these breeds, which can and do produce a good quantity and of good quality both in meat and milk, the most profitable. It is possible there may be localities in which the sheep-owner may properly feel that he does not care at all about either the quantity or the quality of mutton his flock can produce; and other localities in which the fleece of the flock may properly be ignored. But such are exceptional; not the rule. The hog is asked to do but one thing, as a rule, and so it is less easy to apply the rule to him; but certainly it will be admitted that it is not wise to bend all energies to producing the largest possible hogs; or those which have the greatest possible activity; or, even, the earliest possible maturity.

The class of animals best suited for the current needs, will vary greatly with the different conditions of our agriculture; there is room and need for many breeds combining, in different proportions, various characteristics, but the most useful will be found to be those which meet general rather than special needs, and the average farmer in selecting for his own use will do most wisely if he choose those which can do two or more things fairly well rather than those which have no fitness save for one purpose.

Hygienic Information.

STOMACH AND LUNGS.

S. B. PECK.

IF I recollect aright, GRAHAM the great apostle of vegetarianism, held that bread made from unbolted flour was more healthy than that which we call "superfine," for the following reasons: First, because the bone-forming material of the grain was mostly or entirely in the skin; and to the lack of this in the food he imputed the early decay of the teeth. Second, because this skin or bran was a stimulant to the stomach, preventing constipation, and by increasing the labor of that organ, giving it tone and strength, just as the strength of all the other muscular parts of the body is increased by judicious exercise, while the eating of finely comminuted food did not give sufficient exercise to the coats of the stomach to keep that organ in the most perfect health.

Whether I am correct or not there is force in the latter reason at least. But whether GRAHAM succeeded in demonstrating in his own case the correctness of his vegetarian theory, I am not positively informed, but I think he did not. At any rate I have always believed that the cause of the early deaths of four of one family of my relatives, was their persistent practice of his vegetarian theory, and still I am inclined to think he was right in the advocacy of the bran diet. Now, the lungs as well as the stomach are operated by muscular force, and why should not these muscles as well as those in the other parts of the body, require vigorous exercise for the most perfect development and most perfect health? Not that this vigorous exercise of any of the muscles is required at all times, but in the natural condition of man they are all liable to be called upon to do extra duty in emergencies, and if they have been allowed to become feeble through inaction, they become unfitted for this extra work, and are liable to injury or to fail when called upon for it.

An aged friend afflicted with asthma dates the commencement of his complaint from a period long after he had ceased ordinary labor, and upon the occasion of his running to head off an unruly cow. Mortuary statistics show that disease of the lungs, or, in other words, consumption, is the most fruitful source of death from disease. In the present state of civilized society, the ordinary occupations of mankind, especially of the female portion, require but seldom any muscular speed that needs to call forth any extra exertions of the breathing apppartus, but in most occupations the head is naturally thrown forward, while the chest is compressed and with it the lungs, preventing, in a measure, that easy and full exercise of the muscles of the chest which nature designed they should have. It has long been my opinion that the great prevalence of consumption was caused by the lack of sufficient breathing to keep the lungs in full health and strength, and that a judicious use of these most important organs has more to do with our health and comfort than we are apt to think.

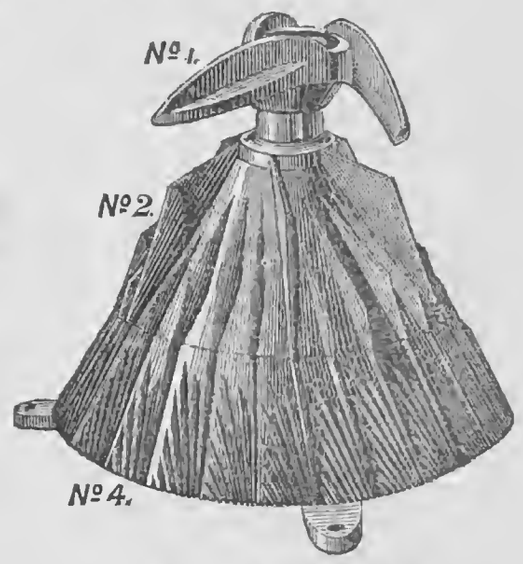
A friend is subject to repeated attacks of what is called sick headache, and tells me that he obtains greater relief from unnaturally full and heavy breathing than from any other remedy. Mrs WILLARD, principal of the late Troy Female Seminary, has related her successful treatment of a case of cholera in one of her pupils. The most that I now remember in this case, is that the pupil was made to move about in the open yard even with a supporter on each side, and take in full and heavy inspirations of cool air; and I have noticed, in my own case, that the most violent ague shakings were quieted, as long as I could hold my lungs completely full of air.

Muskegon Co. Mich.

Industrial Implements.

THE BIG GIANT CORN MILL.

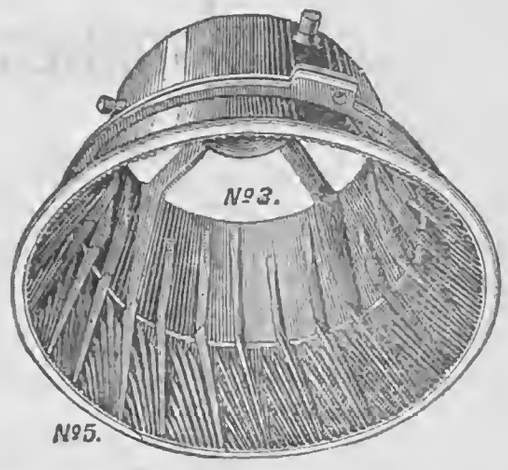
The uses of a good corn-mill are apparent in the improved condition of all kinds of stock to which the ground food is fed; besides, the judgment of those who make a practice of reducing food to a pulverized condition, is that it becomes more nutritious. In the case of corn that is ground just as it is plucked from the stalk—husks, cob, and grains—it is also claimed that the alkali contained in the cob, acts as a corrective, and is a sure destroyer of bots.



Commercially, when the price of grain rules low, it is wise economy to bring your corn-mill into active use, and by fattening stock more than secure an advance on the price of corn in addition to producing manurial deposits that, of themselves, represent cash.

Since our trade with England in cattle, has assumed the shape of a steady industry, it behooves us to keep and extend our advantage. One reason, it is said, why American beef is sought after, is because the fats are more solid, and less oily in character than native breeds that have been gorged on oil-cake: therefore, to avoid this defect and keep up our standard, we should feed our corn liberally. To do this profitably we must have a mill that will grind rapidly, without waste, and with the smallest expenditure of power.

The illustration of the Big Giant Corn Mill, which is given in this issue seems to fulfill the conditions of success. It is warmly commended by those who have used it, both as a feed grinder, and for general family purposes, inasmuch as it will, when necessary, grind fine enough to produce an excellent quality of meal.



The improved mill is shown in the two illustrations, and needs little description. The subjoined cut, shows the inside grinder with cone and breaker-arm. The breaker-arm (No. 1.) keeps the corn from riding on the arms of the mill, stirs it in the hopper, and secures a sure self-feed. The cone (No. 2.) is very steep, and contains crushing and cutting blades. The lower inside section (No. 4.) has blades similar in shape to the furrows in a burr stone, which secures fineness and rapidity of grinding. The second cut represents the outer grinding surface of the mill, and corresponds with the inner surface. Any wear may be taken up, or adjusted by means of set-screws, and the mill may be made to grind fine or large by the same appliances, a feature peculiar to this mill it is claimed. All parts subject to wear may be renewed at trifling cost and trouble, and the knives being self-sharpening, will work effectively until ground flat. Various sizes of the mills are made, varying in grinding capacity. All who have used it seem to be agreed that the mill does a large amount of work, proportionately to its size, and that it is an economical, durable mill, but details of this nature may be more satisfactorily acquired, by applying to the manufacturers, Messrs. J. A. Field, Son & Co., St. Louis, Mo.

OSBORN'S GRAIN AND SEED SEPARATOR, made by Denison Fredericks & Co., Syracuse, N. Y. has a very wide range of work. It is said to separate satisfactorily oats, clover, wild buckwheat and other impurities from spring wheat, rye, cheat, etc., from fall wheat; oats from barley (for seed;) wild mustard, lastard flax, pigeon grass-seed, and every other foul seed from flax seed. The separator will be in operation on the fair grounds at Elmira.

SATURDAY SEPT. 14, 1878.

THE WHEAT CROP.

THE several articles on wheat culture published in this as well as in late issues of the RURAL, from the pens of some of the most successful wheat-growers in different parts of the country, supplemented by the information on the subject contained in the multitude of crop reports which our friends everywhere have enabled us to place before our readers, have given them ample details, both with regard to the local yields of the last crop in nearly every section, and with regard to the best practical means of securing a remunerative measure of success for the next crop throughout the whole country. Connected with the latter point, however, it may not be wholly superfluous to call special attention here to the necessity of selecting good seed, to insure a satisfactory yield; and also to the advisability of sowing early, in order the better to avoid the ravages of the Hessian fly.

By far too little attention is generally given by farmers to the selection of the best attainable seed, yet in a crop, like wheat, in which the profit is rarely large, the difference between good and bad seed may make all the difference between a remunerative crop and one that does not pay expenses. Having decided upon the variety to be used, the best plan for selecting the seed is to take it from those parts of the field that ripen the earliest and produce the best grain; thrash this by itself, and be careful to prevent all intermixture with other sorts. Special attention should be bestowed on the last point, for mixed grains seldom ripen together, and never bring so high a price in the market as a pure kind. It is within the experience of most farmers that an inferior grade of wheat, when pure, commands a higher figure when sold, than better kinds where two or more varieties are mixed; yet rather than take a little extra trouble in selecting and thrashing seed wheat separately, the lessons of this experience are too often disregarded.

Next to a fertile well-tilled seed-bed, the best safeguard against the depredations of the Hessian fly lies in early sowing. The time for this will vary slightly in different parts of the country, but if winter wheat has not already been sown, no time should now be lost before doing so, in those districts where this pest is prevalent. The plant will then outgrow the insect, and if the first stalk is destroyed, a second will take its place.

Just now the prospects of a rise or fall in the price of the wheat is a matter of primary importance to all wheat-growers who have not already disposed of their crop. This, of course, is a question which rests mainly upon the proportion of supply to demand, upon the excess beyond domestic needs, produced in countries where this cereal is extensively cultivated, as in the United States, Russia, Egypt, and some parts of India, as compared with the deficiency in the supply of the grain throughout the rest of the world, and the consequent demand that will be made on the surplus stock.

A letter on this subject just received from the Department of Agriculture, gives us the very latest official estimates of the wheat harvest in this country. These differ but very little from those given in our issue of July 6th. The indications are that the total area of wheat for 1878, is about 17 per cent greater than in 1877; winter wheat having increased about twelve per cent, and spring wheat twenty-three per cent, the total area under the crop being probably 31,000,000 acres. Last year the average yield was estimated at 13.9 bushels per acre, and at that rate, the crop of 1878 will aggregate 430,900,000 bushels. This of course, is only an approximate estimate, as full returns will not be systematized before December next.

From other sources, we learn that out of the crop of 325,000,000 bushels for 1877, 216,000,000 bushels were needed for domestic seed and consumption, to the first of this month, leaving for export about 100,000,000 bushels. Assuming that our requirements for seed and consumption, during the coming year, will be as much as 220,000,000 bushels, we shall still have for export in the year ending Sept. 1, 1879, upwards of 200,000,000 bushels, or double the surplus product of last year. A large number of calculations made on the returns from the Department of Agriculture, checked or supplemented by those from different States, in no instance, reduces this estimate by more than 13,000,000 bushels. What, then, are the chances for a large demand and therefore a profitable market for this enormous surplusage?

In Great Britain there has been, during the past year, a trifling increase of 50,000 acres under wheat, and a proportionate increase in Ireland, making the total area under this crop in the United Kingdom, 3,400,000 acres. The yield of the new crop is fully up to the average, or indeed a little better than for some years. According to the latest reliable estimate, it will yield, at the usual average of 27 bushels to the acre, 92,000,000 bushels, leaving 104,000.000 bushels to be drawn from abroad. France usually exports a little wheat, but this year her crop is reported slightly below the average, so that the French will probably be buyers instead of sellers. Reports of this year's grain crops have not yet arrived from the remainder of Europe, and so soon as they reach us, our readers shall be promptly put in possession of them, so as to be able to form an intelligent opinion of the outlook. On the whole, the present prospect is that while prices will probably not depreciate much, it is highly improbable that they will permanently rise even a little.

ONE HUNDRED BUSHELS.

SOME physiologists and statisticians have, in time past, expressed doubts as to whether an authentic instance of human life prolonged beyond a century, could be adduced. But too many cases have now been brought forward, and centennarianism is becoming too common for any one to doubt of its reality.

Mr. FRANK MILLER, the editor of Millers' Weekly, published at Portsmouth, N. H., voices a wide-spread incredulity as to the fact of hundred-bushel crops of corn to the acre, by offering a handsome premium for a thoroughly authenticated instance of such a crop—not by estimate, but by actual measurement of the shelled corn in a merchantable condition. We have no doubt that Mr. MILLER will have an opportunity to draw his check for the amount of his offered gratuity. But he will, before doing it, insist on such perfect proof as forever to set at rest the doubts that prevail, not only with the public generally, but among a vast number of farmers as well.

There is certainly no *a-priori* reason to doubt the possibility of hundred-bushel yields. A very little inquiry will show that one perfect ear of corn to the stalk is enough to overrun that quantity. This, without regard to the variety of corn and the size of the ears, because there is a very close ratio between the size of the ear and the distances necessary to be observed in planting. In the South, six feet between rows is a moderate distance, while the Canada corns grow with less than half the space, and make up by count all that is lost on size in their respective ears. The average corn yield is less than 30 bushels per acre. But when one who travels much among the farmers, observes the hight and abundance of weeds in most of the corn fields he passes in the month of August, he will see an abundant reason why hundreds of good farmers honestly report average crops in excess of 50 bushels to the acre. Clean culture alone will insure this result with almost any variety of corn. Now, if we will but add to clean culture a careful selection of seed adapted to the locality, and well cured, so that all may be depended upon to grow, and to this superadd a careful preparation of the soil and an adequate fertilization, what is to hinder, not an average, but yet not unfrequent yields of 100 bushels of dry shelled corn to the measured acre? Steady efforts to reach such crops will soon have a perceptible effect upon the national averages of this peculiarly American cereal, until it may rise to 50 or 60 bushels to the acre. We do not doubt the possibility, by good farming alone, of doubling the corn crop without adding a rod to the acreage upon which it is grown.

BY THE ROADSIDES.

As one walks along the roads in the country, if he is an observant man, he may learn many lessons of value. The dwellers along the roadsides may not suspect that their characters may be read very plainly by the condition of the road in front of their homes, and the appearance of their surroundings. But it is so, and every man has a certificate of character exhibited at his door, or upon his fence, for the passers-by to read. For instance, just now we may see roadsides white with the wild carrot or other pestiferous weeds. This shows that the owner is careless and thriftless, because he is suffering injurious weeds to multiply, and lay up future trouble for him; that he is selfish and regardless of what is due to his neighbor, because he is actually injuring the latter's property by stocking it with weeds, and laying up trouble for him as well as for himself; also that he is not a law-abiding, or at least, that he is a thoughtless citizen, because he observes neither the written law which, in nearly every State, obliges every owner or occupier of property to destroy injurious weeds upon his premises; nor the unwritten law of justice and kindness to his neighbor, which would impel him to "do as he would be done by." So it is with everything about the house, the gardens, the yards, barns, stables, and fields. A man's character is set forth by these as plainly as if it were printed in the largest type, and hung up for public inspection upon his front fence. Actions speak louder than words, and by our works we shall be judged.

The moral of this little homily is so plain that nothing further need be said as to its application. Let every man judge himself by it, however, and not his neighbor. Then some good may result. And this is the very time when action in this regard will be most effective.

Shirking.—The poorest of all ways for a farmer (or anybody else,) to try to get rid of trouble, is to shirk it. The man who "faces the music" with the most promptness, who "takes Time by the forelock," who "never puts off till to-morrow, what ought to be done to-day," is the man who will be most successful, have the most leisure, the least worry, the most comfort, and make the most money. Those who see a "lion in the path" when a big job of work rises before them, and cower down, instead of springing up, are not those who will make farming pay. It is as important for the farmer as for the sailor, to keep a good look-out ahead. No man's plans should be more far-reaching than the farmer's. No man should more carefully consider the alternatives of the situation, or be more ready to "about ship," when suddenly-occurring changes take place, or to substitute one course for another, as circumstances demand.

COARSE MANURE.

What is the use of having any coarse manure, or "long manure," as the English call it? The manure itself, *i. e.*, the dung and urine, is not "long." The "long" comes from the corn-stalks, straw and other rubbish that are thrown into it, or used for absorbents and bedding. Why not cut up all such material, so that the manure will always be fine enough to plow in without trouble, or use for top-dressing? Then we should have no excuse for keeping great manure piles about to "rot down," and no need of "compost heaps." Manure does not improve in its fertilizing power by keeping. It is never any better than when it is first made. Why keep it merely to improve its mechanical condition? Why not have that right at first, and to begin with?

One of Many.—The New York Sun publishes as if from one of its own correspondents the interesting description of Tiptree-Hall Farm, sent from England to the RURAL by Professor ROBERTS, of Cornell University, and published in our issue of the 24th ult. With the exception of a slight alteration in the headlines, the entire article was published *verbatim* as original correspondence by our contemporary, in its Sunday edition of the 8th instant. The injustice done to us by such appropriation of our property, without the courtesy of an acknowledgment, we suppose we must bear with equanimity, since there is no alternative. Similar offences, committed by papers all over the country, have taught us to endure them with philosophic indulgence, but it is aggravating all the same, and a miserable sort of *reward* for the pains and expense which we are put to in obtaining such original matter.

The Old Folks' Stupidity.—It is related that when tea was first introduced from China into England, some great mistakes were made in the use of it. Some persons steeped the leaves in hot water as they were directed, but, instead of drinking the infusion, they threw this away, and tried to eat the leaves as a vegetable. Of course, there was great disappointment and the new vegetable was set down as an unmitigated fraud and humbug by those stupid old folks. Well, the stupid folks are not all dead yet. Some are still left that we may be amused by their mistakes. Suppose a farmer piles his manure up in his yard or leaves it soaking in the rain-water, while the strong, dark liquid is thrown away on the roadside, or flows away into some brook or pond; and the drained, dry, useless stuff left, is spread upon the fields in place of good manure; might not such a person be thought as stupid as our good old great-grandmothers who threw away the tea and tried to use the worthless leaves?

BREVITIES.

GEN. LE DUC favors us with all of the few reports he has thus far received of Defiance and Champlain. We trust later reports may prove more favorable.

COL. M. C. WELD has a female Dioscorea batatas (Chinese Yam) bearing fruit. It bears no axillary tubers as the male plants do, which might have been anticipated. Could this female plant have grown from the axillary tubers? There was no seed sown.

MR. TEMPLIN says on another page, speaking of wheat, and it is worthy of special emphasis: "As to the seed to be used, I will only say that a man should sow just such as he wishes to reap. If he desires pure wheat, he should sow pure wheat, but if he have a partiality for chess, cockle, or other foul weeds, he should sow seed in which these abound."

A LINE DRAWN.—The patent office at last draws the line at a chalk mark. It has refused a patent to J. G. Strong, and Kate M. Strong, of Talladega, Ala., for an "ant-guard;" said ant-guard being merely a chalk mark, which ants are supposed to be unable, or unwilling to pass over. This is well. Patents of late have been granted with such a perfect looseness, that we have sometimes thought it would not be long before somebody would get a monoply even on winking; and then we should have men around threatening all the young fellows with suits for infringement, unless they would pay a royalty to the "inventor." But it seems that a "thus far and no farther" has been reached in the Patent Office, at last. We offer our sincere congratulations to the commissioner, and his corps of "able examiners."

IT is well to bear the following in mind. 1. Every fully developed plant, whether of wheat, oats, or barley, etc., presents an ear superior in productive power to any of the rest of that plant. 2. Every such plant contains one grain which, upon trial, proves more productive than any other. 3. The superior vigor of the best grain is transmissible in different degrees to its progeny. 4. By repeated careful selection the superiority is accumulated. 5. The improvement, which is at first rapid, gradually, after a long series of years, is diminished in amount, and eventually so far arrested that, practically speaking, a limit to improvement in the desired quality is reached. 6. By still continuing to select, the improvement is maintained, and *practically* a fixed type is the result.

Literary Miscellany.

THEN, NOW AND HEREAFTER.

MARGARET B. HARVEY.

I.

Oh, precious heart!
Thou knewest when my spirit drooped in pain,
And gently thou didst bid me hope again.

My wearied soul,
Like gladdened lark, with sudden shrill, did rise
And soar to the blue heaven of thine eyes.

Their wondrous light
Seemed like the gold through azure poured at morn,—
And where the singer's lost, the song is born.

And soft the strain,
Or ringing jubilant, the humble bird
Cares only that the skies and sun have heard.

II.

Long years have passed.
And now my soul, like wounded lark, doth soar
To warm blue skies and golden sun no more.

Her notes are hushed,
And by her ruined nest, mid leaves and mold,
Alone she cowers in the damp and cold.

But still a song
Is faintly quivering, though her voice is dumb,
And some glad day a flood of joy will come.

For once again,
Like gladdened lark, my longing soul shall rise
And soar to the blue heaven of thine eyes.

January 20th, 1878.

HOW TO TREAT PLANTS FOR WINTER DECORATION.

JULIUS J. HEINRICH.

Supposing that some plants have been procured for winter decoration of the room or window, as recommended in Rural of Aug. 10th, the next thing to be done is to grow them in proper shape, and to prevent them from blooming, which is done in the following way:

They will need shifting or repotting from time to time, which can be judged by simply knocking them out of the pot and seeing if the roots are all matted together between the pot and the ball of soil; if they are, they require repotting; if not, wait a little longer. (By the term "knocking out" is not meant to break the pot all to pieces, as some have supposed, but simply to separate the pot from the ball of earth, which is done by taking hold of the pot with the right hand and spreading the fingers of the left hand over the surface of the soil in the pot, and allowing the plant to rest between the middle and first finger. Now invert pot and plant so that the latter hangs head down; give a gentle rap or two on the rim of the pot on the edge of some table or bench so as not to strike the plant, and it will slide out nicely into the left hand.)

In repotting, first put a handful or so of soil in the bottom of the new pot so as to get the top of the ball of earth just one inch lower than the upper edge of the pot; this will allow plenty of room for watering. Set the ball in the center of the pot and fill all around with fresh, rich soil; press well down with both thumbs and give a gentle rap on the bench to make the surface perfectly level. Then water well. If the roots are very much matted, loosen some of the soil from the top of the ball, outer edge first, and then repot. Always be careful to set the plant in the center and have it rest perfectly straight, as nothing looks worse than to see a fine plant spoilt by leaning to one side.

Fig. 5.

The best pots to grow plants in are the common clay pots (Fig. 5). After years of trial I have found plants to do better in them than in anything else, for the following reasons: If you have had plants, you will notice that the sides of the clay pots are moist and always covered with a greenish, slimy substance; and the cause of this is that the surplus water finds at the sides of the pot the quickest outlet, being porous. Water will sink to the bottom of the pot when there is too much for the sides, and run into the saucer, if one is underneath to catch it. If this surplus water is allowed to stand in the pot it will cause the soil to become sour, and the roots will rot and finally the plant perishes. It can therefore readily be seen that the side-drainage is of as much consequence as that in the bottom, and for this reason glazed or painted pots will be found inferior to the clay pots, as all the pores they have in the sides are closed up with paint, etc. I know quite well that they have holes in the bottom, but the millions of little holes in the sides are not there. Fancy pots may be used to advantage in this way only: For those wishing to raise plants in summer for winter's use and having no garden, they can grow them in the window, but they must not be allowed to bloom. Pot the plant in clay pots that may be fitted into the fancy ones. Pot and set them in the window. In this way the clay pot is hidden and the drainage is not interfered with. Those having no fancy pots and wishing to hide the clay, can use a pot-cover (Fig. 6). It will hide the pot and give it a very neat and ornamental appearance without interfering with the side drainage. These covers are made of Black-walnut or Whitewood painted green, red, blue, yellow, etc. Some are also gilded like picture-frames, and others have gilt and green bars.

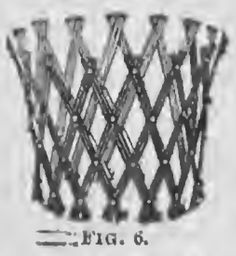

Fig. 6.

They can be obtained any size from four to eight inches high, and from $1 to $7 per doz.

The arrangement shown in Fig. 7 can be used on the outside of a window in summer, or inside in winter. It is simply a wooden board resting on two iron brackets with a Black-walnut pot-fence around it: it can be bought to fit any window. A, is an extension ivy trellis; B, is a pot trellis for any kind of climbing plants, and E, is the pot cover already spoken of.

Pruning will be required as the growth of the plants progresses, more or less. If the plant is too tall or spindling, and you wish it dwarf or bushy, cut the crown or center stalk off, as shown in Fig. 8, A, as low down as is desired. This will force the plant to start or send out new branches from the sides of the old stalk B.B.B.B. If, on the contrary, you wish it taller, cut the lower branches off at B.B.B.B., Fig. 8, and not at A.;

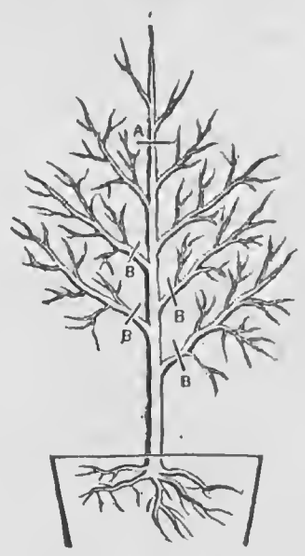

Fig. 8.

this will force it up. Cut away all dead or dried branches, that may by accident be broken off, and see that all the withered yellow leaves are removed. By cutting or pruning off all the buds as fast as they appear they will be prevented from blooming now, and will bloom in winter with more profusion. If allowed to bloom now they will not bloom in winter. Stop cutting off the buds about three weeks before bloom is desired. Those raising plants from seed will have little other care but watering, for three weeks to come; but see that they do not want for that, else one's labor will be of little avail.—To be continued.

TWO IMPORTANT PAPERS.

"I don't know what I shall dew with that 'ere boy," said Farmer Long to his wife, as they sat by the fire, that winter morning. "He's more harum-skarum than that State's reform-school boy was."

"Well, father, have patience with him for the sake of his folks. I think there's something in Jim that will surprise you, one of these days."

"I dunno whether he'll surprise me enny more'n he has or not. Last spring he made b'leve he knowed all 'bout biling down sap, 'nd surprised me by burnin the bottom uv the sap-pan eout, 'nd settin' the sap-house on fire. Last summer he broke more tools in haytn' time than all the rest uv us together. And dear me! Yeou'd orter seen him dig pertaters last fall! I'll venter he cut every third one in tew—struck at 'em ez ef he was splittin' rock-maple logs. 'Nd neow he's broke my best three-tined pitch-f rk, some way, a feedin' the cattel. He's on'y 16 y'r old. Ef he doos this in the green tree, what in nater 'll he do in the dry?"

After these remarks about the boy he had taken to keep until he was of age, the farmer started for the barn. He was bending over the great meal-chest, just inside the barn door as a tandem team was turning around the corner of the barn. This team consisted of a wild yearling steer and the boy, Jim Fowler. The "team" was on the "dead" run. The youth had hold of the steer's tail with his left hand, and held aloft a milking-stool in his right.

Mr. Long was unaware of danger; and when something struck him, and immediately he found himself on his back in the meal-chest, his first thought was of an earthquake or a tornado or other dread outbreak of forces. He emerged from the chest just in time to see his lime-backed steer pass on into the stable and Jim Fowler arise half stunned from the floor.

"Yeou young scamp!" he thundered, "Yeou'll murder somebody yet—er—er I shall, if yeou don't stop yer dumbed work."

The boy did not laugh at the miller-like appearance of the man. His own face was quite as white as the farmer's as he said:

"I'm awful sorry, Mr. Long."

"I dunno whether yer be er not," replied the latter. "But I'll tell yer neou 'nd here, Jim Fowler, what's what. When yer father died yeou haden't a relative left"

"No, sir, they wan't none left," broke in the youth; and the tears filled his eyes.

"I promised him a little afore he died, I'd take care on ye until yeou was old enough ter take care uv ye'self; 'nd do well by ye—give ye a common school eddication 'nd so on. 'Nd I mean ter dew it if yer conduct don't become onbarable. But yeou must be more stiddy 'nd man-like 'nd not plague me ter death by yer recklessness. D'ye hear?"

"Yes, I'm goin to try, Mr. Long."

"That's the sorter talk. I want ye ter go ter school 'an git ter be ez smart ez Jennie is, ef ye can. Yeou er tew years older'n she is nd y'aint nowhere side her."

"I know it. I aint nowhere side by her."

Jennie, the farmer's daughter, was a bright girl; and as pretty as a pink. Jim did not wonder that her father and mother were proud of her; or that they felt there was a vast difference between him and her. He thought there was himself; and he believed she did, for one day of the last summer, when he stumbled onto her flower-bed, she spoke sharply at him and, if he had not misunderstood her, called him a "beggar."

He was careless and stupid; if she had said as much, he would have thought it justifiable under the circumstances. But for her to speak in that way—as if his misfortune was his fault—made him almost hate her. He did not answer back, but the look he gave her kept her from ever repeating the taunt; and also from forgetting that she had once made it.

Yet he continued to be the same careless "Jim" up to this winter morning. But when Mr. Long had administered his reproof and returned to the house to brush the meal from his clothes, the youth fell into a profound meditation, out of which he came with this ejaculation:

"I'll do it!"

When the next term of school began, there were two scholars from Farmer Long's.

Jennie and Jim.

They went together; but separated when they got there, for Jennie was in a higher department than Jim could enter. This was the first term the latter had ever begun with a determination to learn. That he was now so determined is proved by the answer he gave to his teacher on the first day of school, when she asked him, among other things, what he wanted to do; it was this: "I want ter git ter know ez much ez Jennie Long does."

How did he come out? Well, he went to school every term for three years. He studied evenings, and all the time when not at work, during vacations. By incessant devotion to his books through those three years, he was able to master all the text-books used in that institution. For the last two terms of his course, he was a member of Jennie's classes. He graduated when she did; and, in most of their joint studies, was marked several points above her.

How did Jim think he came out? Going home with Jennie that last day, after school had closed, he repeated the words Mr. Long had spoken three years before: "Y'aint nowhere side uv her;" and thought they were truer now than ever.

Had the "want ter git ter know" with which he began, given place to a "want" less likely to be satisfied?

If Jennie had been aware that her own views concerning the result of their rivalry—if it was such—coincided with Jim's, she probably would not have expressed herself as she did to her mother, that evening, when they two were alone. "I suppose," said she, "he thinks he's done a wonderful thing; but I don't. If I had studied and studied and studied as he has, I should have been far ahead of the great—great—giant. But of course I don't care a fig about it, mamma."

Whether Jennie's remarks indicated a happy frame of mind or not, might be a question. But without question she used a very happy word when she spoke of Jim as a giant, for he was a mighty youth. Jennie was really petite. She knew it; but it did not trouble her that those girls who were familiar with her called her "Little Jennie Long."

Jim knew that he was of great stature for his age; and was a little sensitive on that point. I

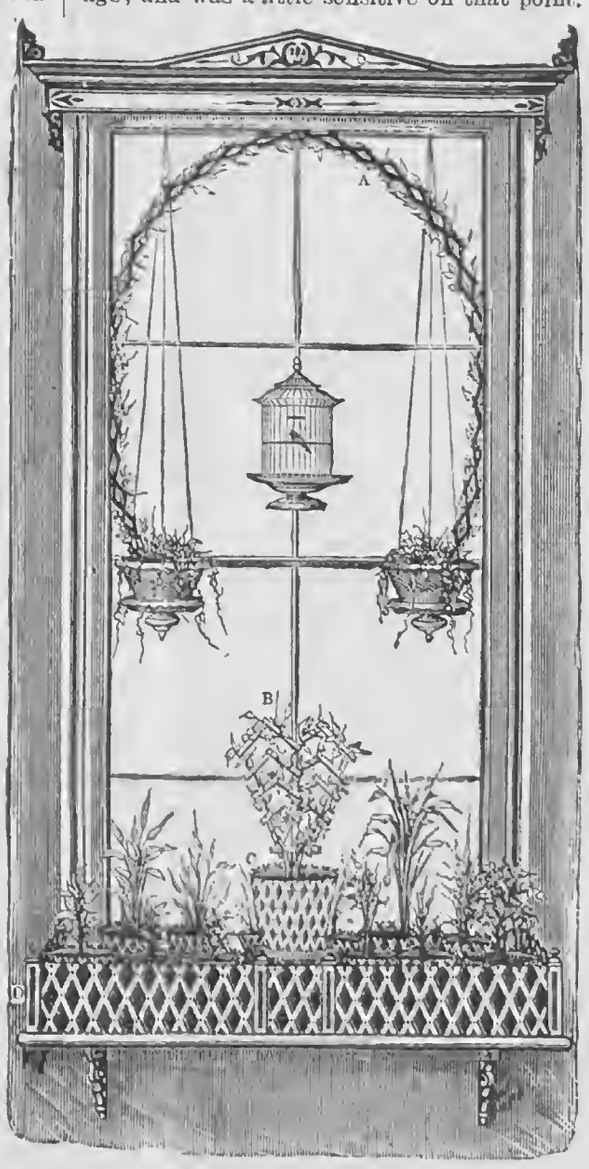

Fig. 7.

don't think he fancied being called "Big Jim." And it may have been his aversion to that name that accounted partly for his blushing so deeply one morning of his last term, when he had taken his seat at the opening of school. Some mischievous youth had written a stanza on the blackboard—which was on the wall that faced the seats—and written it in such a large hand that every scholar could read it from where he sat. This is a copy of the lofty verse that the teacher hastened to erase, as soon as she discovered what the scholars were laughing at:—

"But one dares write—what every one knows—
That several *little* fellers fret,
Because a chance they never get
To walk and talk with Jennie Long.
Who hinders them? *Big* Jim—the strong.
He comes with her; and with her goes;
And thinks she wants him to, I s'pose."

When Jim's eyes caught that, his face turned very red, as red as—Jennie's.

The youth that wrote that poem "dared" to write it; but he did not dare to make himself known.

Of course it was nothing but "boy's play," but Jim felt that he was near enough to being a man to look at it from a man's stand-point. And looking at it in that light, he thought it proper to tell Jennie that night when they went home that he was very sorry that some mean fellow had annoyed her in such a way; that he would find out the puppy who wrote the stuff and give him a sound thrashing.

But Jennie, to the surprise of Jim, could not see wherein she had been injured to an extent that demanded any such course as he proposed to take. And she dissuaded him from his sanguinary purpose. Not easily, however, but by arguments made in an earnest manner, and urged more and more strongly, until he was conquered.

Without meaning it, perhaps, Jennie said some things, before they reached her father's door, that were calculated to mislead Jim, as to the place he occupied in her thoughts. It was nothing positively encouraging; but something that came nearer to being that than anything she had ever before said to him. Of course it must have been unintentional, for nothing in that line was repeated during their walks to and from school the remainder of the term. And when the term closed, as was said before, Jim felt that she was farther from him than ever. He saw with the clearness of vision that is characteristic of young men in his state of mind, the hopelessness of any attempt to make himself her equal in any respect, and then acted as a youth in his circumstances usually does. He intended to remain with Mr. Long until he was of age, for he knew he could be of great service to the farmer in the two years that intervened between the present and that time. And he wished to repay the latter for his kindness to him.

For the first few months of those two years, he was apparently quite self-possessed in his association with Jennie. But that is all that can be said to his credit. He broke down—utterly succumbed—before six months had passed, proposed; and—told Jennie he did not blame her for not caring for him, and hoped she would forgive him for offering such a poor creature as himself to one like her; that he could not help it; that he felt he must know what he was to her, and now he did know.

Jim had discovered Jennie the evening when he asked that question, sitting on a bench under the great maple, back of the house. There she left him, and went into the house; and there for a long time he remained after she had gone, sitting in her place, with a sensation at his heart unlike anything he had ever before experienced. Not contented to let "well enough" alone he had gone from the negative comfort of conjecture, into the positive pain of certainty.

The next morning he entered upon his labors, with less encouragement than Jacob did upon his, after Laban's second promise. Less by as much as a refusal is less than a promise.

And Jennie? If her night's rest had been less sweet and refreshing than usual, she showed no signs of it. She appeared to be merrier than she had been for some time. Early in the day when she and her mother were engaged in the labors of the household, she surprised the latter very much by a "season" of laughing,—a season of very violent laughing.

"Jennie!" exclaimed Mrs. Long, at last, dropping into a chair, "What does ail you?"

"Why, mamma, it's the funniest thing—I've been proposed to."

"Proposed to? By whom?"

"By Jim."

"By *our* Jim, Jennie?"

"*Our* Jim, mamma."

"The foolish boy! Of course you told him, kindly, that you both were too young to think of marriage. Your father was twenty-six, and I was twenty-two when we were married. What did you tell him, Jennie?"

"I told him—no!"

"That was right; only I—I hope you did not hurt his feelings any more than was necessary. I trust he will forget all about it soon"—

"What, mamma?"

"I mean, Jennie, that I hope he will see how foolish he has been, and forget all about you before he goes away."

"O, certainly I—I hope he will—will forget—and—see how it is, before then. He's poor, you know—very. I—I told him so. I wanted to—help—him forget, as you say, and so I said in case I married, in the course of twenty or twenty-five years, I should probably wed a very rich man; then I shouldn't be any trouble to my—hus—husband; but that I shouldn't do for a *poor man* at all."

"Well, Jennie, I do sincerely wish that he may soon care as little for you as you do for him."

As the months passed away, Mrs. Long, watching Jim, concluded that he had not suffered much by the rejection he had received. The kind-hearted woman was glad to think it was so. Considering all things, the less attraction her daughter had for the young fellow, the better.

Jennie, also, hoping as we may suppose that Jim, for the sake of his peace of mind, would outgrow his affection for her, after a little while, decided that he had. She was very glad of it. And

yet there was a tinge of melancholy in the discovery. She was glad for his sake, because he had suffered so; but it was—abstractly considered—a very solemn thought that so strong an attachment was so short-lived. Not that she would have had it last longer in this particular case,—oh, no; but there might come a time when she should want to know that the one who had so great a regard for her was to have it forever. But what was she to expect? Was Jim a fair sample of mankind in this respect?

If Farmer Long had been an observing man, during these days he would have seen coming into Jim's face, something that could not have failed to remind him of the time when the youth's mother and Mrs. Long were girls, and the best-looking ones in the village. The father's strength had come into Jim's body and limbs, but he was getting his mother's face by installments. These were to be his possessions when he was of age.

As his 21st year drew toward its close, he could not tell whether to be glad or sorry for it. His reason told him to go and forget—he had not forgotten you see—in the excitement of business somewhere, his disappointment. But that heart of his kept forever answering "Stay another year." He was in this state of mind the day before he was twenty-one. After dinner that day he went and sat on the bench under the great maple. He went there that he might be alone to decide whether he would follow the dictates of his reason or give way to the longings of his heart. Reason at last carried the day. He arose from his seat, and said aloud, and decisively, "I shall go." It was settled. He had told the family all along that he should go away when he became of age. He was glad they knew it and had become reconciled to (perhaps wished) it. He was set upon looking straight ahead now, and determined not to look back.

And he did look straight ahead—Look? he stared, for just a second or two, and then went ahead, straight and fast. Up the slightly ascending meadow Jennie was running toward the house; and not far behind her was the four-year-old lime-back, pursuing. It was fortunate for Jennie Long then that Jim was near; and that he was "big" and strong and brave. Jim was bent on getting between Jennie and that mad brute and he could not stop to find weapons. He rushed past her and at that moment her strength gave way and she fell. If Jim had made a mismove—but he did not. With great dexterity he seized the animal by the horns as it came up, and putting forth all his strength drew its head with such force and suddenness to one side as to throw it down. Then springing to where Jennie had arisen and stood unable to move, from fright, he caught her in his arms and bore her to a place of safety over the wall.

When Jennie could speak, she turned to Jim and asked, "What if you had been killed?"

"O, there would have been a beggar less, that's all," said he, and he walked away.

An hour later Jim, in a deep reverie, was sitting under the old maple. He heard the rustling of a dress, the sound of approaching feet, and then Jennie's gentle call, "Jim?"

He arose and looked at her.

"Jim, do you—hate me?"

"No, worse than that—for me."

"Worse? Then you—don't—feel towards me as—as, you did once?"

"No, for I love you more."

"Truly, Jim?"

"Truly."

"Well, then you may read what I have written on this paper; but don't open it till I get a long way off."

She handed him the paper and turned and walked in the direction of the house. Jim was not long in opening that note, and reading:—

"DEAR JIM:—

Don't go away. JENNIE."

Nor did the writer of it get a "long way" off before he overtook her.

When Jim and Jennie entered the house together, a little later, Farmer Long looked at them sharply for a moment, and then, as if what he saw warranted him, he arose and also handed Jim a paper, saying as he did so:

"I s'hd like ter have yeou look this ere dockerment over'n see of it is kerrect. I don't want no mistake 'bout it. The place that jines mine was fur sale 'n I've bot it. This ere's the deed on't."

And so it was. And that "dockerment" was made to run to James Fowler and his heirs.—*Springfield Republican.*

FROM A GAMBLER'S HOME TO THE THRONE OF THE BRITISH EMPIRE.

JOHN DOBBINS.

THE most popular member of the royal family of England is, without doubt, the lovely Princess Alexandria. Her beauty, her charm of manner and her kindness of heart, have made her the idol of her adopted country, while the slights put upon her by her husband, have roused the chivalrous feelings of Englishmen for the insulted wife.

The splendor of Alexandria's surroundings as the wife of the heir-apparent to the English throne, presents a sharp contrast to the scenes amid which her childhood was passed.

Her father, Prince Christian of Schleswig-Holstein-Sonderburg-Glucksburg, of the royal blood of Denmark, was in 1850 not only a prince without possessions, but a man who found it a matter of very nice calculation, how to keep himself and his family supplied with the barest necessaries of life. He tried his luck at the gaming tables of Baden-Baden and Monaco, but without any very encouraging results. His royal relatives treated him with scorn, and were slow with offers of relief.

Perhaps no more pitiable object can be imagined than this princely adventurer, approaching middle life, burdened with wife and children, wandering from country to country, without resources of any kind, and without credit, seeking whom he might—not exactly devour—but who would be responsible for his expenses. It is not recorded that, beyond taking his chances at the gaming table, he ever made any attempt to work out his social salvation.

He was not, however, destined to forever beg his bread. The revolt of the duchies of Schleswig and Holstein made Prince Christian's fortune. These duchies, claimed that on the death of the then reigning king of Denmark, Frederick VII., who had no sons, they would be freed, from their dependence on Denmark, as the Salic law prevailed in their dominions. King Frederick, who had no idea of losing the duchies, enacted a decree abolishing the law. The duchies had recourse to arms, and after considerable bloodshed, the matter was referred to a Congress which met in London, May, 1852. The delegates sustained Denmark, and ignoring the rights of several princes, who were of near kin to King Frederick, chose the vagabond Prince Christian as heir to the Danish throne.

The appointment gave great dissatisfaction both to the duchies and to Denmark. Holstein continued to protest and finally besought the interference of Germany. In 1863, in the midst of these dissensions, the old king died, and Prince Christian became King of Denmark. He was hardly seated on his throne before his two powerful neighbors, Prussia and Austria, wrested from him Schleswig, Holstein and Lauenburg; so that of his reign the historian can record no brilliant military exploits, or astute political moves.

The most marked feature of his career since his accession has been his success in allying himself, through his children, with the most illustrious ruling families in Europe.

The year 1863 saw the beautiful Alexandria married to Albert Edward, heir to the British throne; and all England gave the lovely daughter of the adventurer, Christian, a glad welcome. In the following year King Christian's second daughter, Dagmar was betrothed to the heir of the Czar of Russia, Czarevitz Nicholas. The sudden death of this young man seemed to have lost the Princess Dagmar her chance of alliance with the royal family of Russia; but fate which for so many years showered misfortune on Christian seemed determined now to show him only a smiling front, for the new Czarevitz, brother to the dead heir, paid court to his brother's sweetheart and won her for his wife. The eldest son of the Danish king, in 1869, espoused the daughter of the King of Sweeden.

The same year in which King Christian ascended the throne, his second son George, 18 years of age, was appointed King of Greece. He was a handsome, amiable man, though not especially fitted either by nature or education for the position he was called upon to fill. He has on the whole made a fair ruler.

The seedy wanderer of 1852 has to-day for his grandsons, Albert Victor, son of the heir to the British Empire, Nicholas heir to the throne of all of the Russias, and the crown Prince Constantine the future king of Greece. The "managing mamma" of society, will, hereafter have to yield the palm to this prince of matchmakers, His Majesty of Denmark.

LOUIS KOSSUTH.—Louis Kossuth, who still lives in Turin, is described as quite feeble, and having aged materially within a few years. He is now sixty-six, and, though for sometime in delicate health, his mind is as vigorous as ever. The stories of his penury are said to have been somewhat exaggerated, albeit he is compelled to live very meagerly, which is no hardship, as he has very simple tastes. He does not complain; indeed, he makes no reference to his poverty, which has been relieved, it is thought, by contributions from admirers in England, France and America. His entire expenditures for several years past have not been more than 3,000 lire per annum (less than $600), which is certainly frugal for a man who was once dictator of his country. He has often been invited to return to Hungary, but he has steadily refused, believing that the Hungarians have not yet gained their rights. In Austria, Hungary is thought to have more than her share of political rights, more than the Austrians themselves, and Francis Joseph is accused of favoring the Hungarians to the exclusion of his own race. Kossuth is reported to have thought the formation of the German Empire as very unfortunate to the cause of freedom in Europe; but he thinks it cannot last if the German people be true to themselves.

RECENT LITERATURE.

Bluffton. A Story of To-day. By M. J. SAVAGE. Boston: Lee & Shepard. $1.50.

IN a prefatory note the author says: "The incidents of this story are chiefly facts. This is specially true of those things that may, to some readers, appear forced or exaggerated." This would seem a refutation of the old saw, that truth is stranger than fiction, for the incidents described are vapid and common-place enough to be studied inventions.

It is the story of a young minister who, lacking conviction, is called to the charge of an orthodox church, and the many trials and annoyances consequent on the false position his weakness and indecision have entailed upon him. Of course these include a rupture with his lady love, and the upshot is, he is obliged to abandon his orthodox flock for a more congenial and progressive field. The numerous long theological discussions are somewhat trite and a trifle monotonous, but it all comes right in the end. In a foreign land he meets his lost love, a reconciliation takes place, and they live happy ever after.

The Witchery of Archery. A complete Manual of Archery. By MAURICE THOMPSON. New York: Charles Scribner's Sons. $1.50.

To all lovers of out-door sports this book will prove an invaluable and timely companion. Mr. Thompson is an enthusiast on the subject of archery, as with his experiences he might well be. He says: "When a man shoots with a bow it is his own vigor of body that drives the arrow, and his own mind controls the missile's flight. When the archer hears his shaft hiss through the air with a force not to be equalled by those of his competitors, he feels justly proud of his superior manhood. His trained muscles and toughened thews have done the work. Not so with gun-shooting, etc." In short, he characterizes the modern shot-gun as barbarous and wantonly cruel, and the bow as classical and poetical—its use manly and healthful. Not only is the book replete with instruction in this fascinating sport to the tyro of either sex, but Mr. Thompson's adventures in search of game when he had become skilled in archery, form a sprightly and interesting narrative.

The Boy Traders, or The Sportsman's Club among the Boers. Phila.: Porter & Coates.

This is another of Harry Castleman's excellent tales for boys, and is one of the Sportsman's Club series. It is a story of perilous and exciting adventures by flood and field, and cannot fail to prove as fascinating to the young reader as any of this favorite author's many popular stories.

A CONTRACT has just been signed by Messrs. Claxton, Remsen & Haffelfinger, publishers, of Philadelphia, and a well-known editor and author, for the preparation and publication of a series of books suitable for counting-house libraries, to be known as the "Business Library Series." The leading object of this series is to collect together for the benefit of the young, the "learning touching negotiation or business" which Bacon deplored had not been reduced to writing, and consequently men must spend half their days in finding out what they should have known in the beginning.

These volumes will be of convenient size, of about 400 large 12mo. pages each, and though prepared by different authors, will be under one editorship. One of the volumes, entitled "Common Sense in Business," by Edwin T. Freedley, will be issued early in September; and this will be followed by another entitled "Home Comforts, or Things Worth Knowing in every Household," in which young wives are instructed how they may save, by good management, a portion of the money which the other teaches their husbands how to earn.

THE POPULAR SCIENCE MONTHLY for September commences with a brilliant article on "The Place of Conscience in Evolution," by Rev. T. W. Fowle. The author, though a clergyman, accepts, without qualification, the great doctrine of evolution, and says that it is taking its place "as a part of the furniture of the human mind." Prof. Du Bois-Reymond's masterly discussion of "Civilization and Science" is concluded in this number, with an examination of the subject of education in Germany. The Professor raises the question as to how the *Americanization* of German higher education is to be arrested, and points out that one of the ways of doing it is by the retrenchment of classical studies. There is a most curious and instructive article on the production of "Artificial Precious Stones," showing the immense strides that have been taken in this branch of chemical industry. Dr. Montgomery pursues the subject of "Monera, and the Problem of Life," treating of the physical phase of the problem with great originality and eloquence. Prof. Daniel Vaughan, the distinguished American astronomer, has a profound article on "The Astronomical History of Worlds," which will be appreciated by all students of the celestial science. Frederick Pollock follows the lead of Taine and Darwin, in tracing "An Infant's Progress in Language." There is a remarkable article by Prof. Grant Allen, on "The Origin of Fruits," which will be read by everybody with pleasure for the originality of its thought and the beauty of its style. There are, furthermore, articles on "Genealogy," "The Teredo and its Depredations," and "Science in the English Schools." The portrait for the present number is that of Prof. O. C. Marsh of Yale College, accompanied by an interesting sketch of his life. The various departments of the magazine, viz., Editor's Table, Literary Notices, Popular Miscellany and Notes, are, as usual, both instructive and entertaining. New York: D. Appleton & Co.

The Parallel and Meridian System of Map Drawing in connection with a Ruler. For making the Parallels and Meridians, whether Straight or Curved. By W. V. MARSHALL. Can be used with any Geography. New York: A. S. Barnes & Co. Price 20 cts.

THE author summarizes the distinguishing characteristics of this work as follows: 1. The parallels and meridians are used as the guiding lines in the construction of every map. This obviates the use of arbitrary lines that have no geographical value and only mar the appearance of a map. 2. It gives the operator more guiding lines than does any other system. 3. It teaches, without special study, latitude and longitude. The pupil gains this knowledge from the frequency of referring to these lines while drawing the map of a country. 4. It can be used with any series of geographies. Hence a change of system of drawing is not necessitated each time a change is made in the text-books of a school. 5. It reduces map drawing to the maximum of simplicity and ease. An appendix, giving some capital ideas on the subject of teaching geography, will be most useful to youthful teachers, and even experienced teachers will find it to contain not a few suggestions which will be of interest to them.

How to be Plump; or, Talk on Physiological Feeding. By T. C. DUNCAN, M. D., editor of the United States Medical Investigator, author of "Diseases of Infants and Children, with their Homœopathic Treatment," etc. Chicago: Duncan & Bros. Price 50 cts.

THE author recommends diet and rest as the only requisites for development. No medicine whatever is required in his course of treatment. He tells how he became fat, discourses on Leanness as a Disease; on the Healthy of Physiological Standard; the Importance of Water; the Value of Fat; the Necessity for Starchy Food and Sweets; and How to become Plump. Dr. Duncan writes in a popular style, and his little book will be a most useful addition to the family library.

SCIENTIFIC AND USEFUL.

NEW YORK AND LONDON TIME.—The difference in time between New York and London is a curious feature in ocean telegraphy. The London banker is in the full swell of traffic when the New York agent is first thinking of "getting up." At noon the London markets are cabled to this city, where they arrive at seven o'clock in the morning of the same day. The London agent of the New York Press telegraphs the most important news issued in the London Times at six o'clock in the morning. It reaches here at one o'clock the same morning, just in time to be inserted in the New York journals, whose readers have the same matter that the Londoner digests with his breakfast.

DISINFECTANT FOR THE SICK ROOM.—Ozone, the newest and the least stable of all gases, has recently been made to do good service in the sick room. It makes short work with those miasmata and organic impurities of vitiated air which the Italians describe by the impressive name of malaria, and which every physician knows to be among the most baneful influences with which the convalescent patient, whose tenure of life is not yet quite assured, has to contend. A mixture should be made of permanganate of potash, peroxide of manganese, and oxalic acid, in equal parts, and two large spoonfuls with some water put into a plate and placed on the floor of the sick-chamber. Care should be taken, however, to remove steel fenders and fire-irons, and to cover up brass door-handles, since ozone will rust all metals meaner than gold and silver.

AN attachment to the ordinary spring eye-glasses, by which they can at will be transformed into spectacles, and as quickly relieved from the attachment, is among the most recent and useful devices that have been brought forward. It was Dr. Cid, the well-known Paris surgeon, who found that the spring eye-glasses injuriously compressed the arteries by which the nose is nourished, making that organ long and thin. The effect of this improved mechanism is to remove all pressure from the spring, and at the same time to hold the glasses firmly in position, and thus is avoided the irritation caused by a continued use of ordinary spring glasses, as in reading, writing, etc. The advantage of being able to convert at once the same lenses into eye-glasses or spectacles is obvious.

THE CAT AS A SUBSTITUTE FOR THE CARRIER PIGEON.—It seems that the Belgians have formed a society for the mental and moral improvement of cats. Their first effort has been to train the cat to do the work of the carrier pigeons. The most astute and accomplished scientific person would have his ideas of locality totally confused by being tied up in a meal-bag and carried twenty miles from home and, let out in a strange neighborhood, in the middle of the night. This experiment has, however, been repeatedly tried upon cats of only average abilities, and the invariable result has been that the departed animal has reappeared at his native kitchen-door, the next morning, and calmly ignored the whole affair. This wonderful skill in traveling through unfamiliar regions, without a guide-book or a compass, has suggested the possibility of cats being used as special messengers. Recently, thirty-seven cats residing in the city of Liege, were taken in bags a long distance into the country. The animals were liberated at two o'clock in the afternoon. At 6:48 the same afternoon one of them reached his home. His feline companions arrived at Liege somewhat later; but it is understood that within twenty-four hours every one had reached his home. It is proposed to establish, at an early day, a regular system of cat communication between Liege and the neighboring villages.

ACTION OF TOBACCO ON THE SYSTEM.—Some years ago the French Government directed the Academy of Medicine to inquire into the influence of tobacco on the human system. The report of the commission appointed by the Academy, states that a large number of the diseases of the nervous system and of the heart, noticed in the cases of those affected with paralysis or insanity, are to be regarded as the sequences of excessive indulgence in the use of this article, and it is remarked that tobacco seems primarily to act upon the organic nervous system, depressing the faculties and influencing the nutrition of the body, the circulation of the blood, and the number of red corpuscles in the blood. Attention is also called to the bad digestion, benumbed intelligence, and clouded memory of those who use tobacco to excess.

SLEEPLESSNESS.—Those who suffer from sleeplessness—and the number is not small—might do well to notice their position at night. A German physiologist states that the heating of the earth by the sun causes magnetic currents from the equator to each pole. We should lie, therefore, in the direction of these currents; if we lie across these, the result is unpleasant, and want of sleep is the consequence. The head to the north is the best position—to the west, the worst. Physicians who have charge of hospitals attend to the directions in which the beds are placed, and with the best results.

A LUMINOUS PAINT.—A French chemist is said to have succeeded in producing a paint with which to illuminate the numbers of street doors at night. Figures traced with it shine so as to be read through the most profound darkness; and the preparation of the compound is said to be simple, inexpensive, and not injurious.

POPULATION OF THE EARTH.—The population of the earth is estimated at 1,423,917,000 souls, of whom no less than 409,000,000 are assumed to live in China proper. The whole of Europe has only a population of 309,178,300.

BRIC-A-BRAC.

IN SUMMER.

An Alliterative Sonnet.

BELLIGERENT, brusque, brown-belted bumble bees,
Singing sonorous, sinuous sailing soar,
Wild, wearless winging, waging wicked war,
Dancing diagonal, darting down degrees;
Triumphant trailing trumpeters trim trees;
Rills, raising riot, rushing, running roar;
Past peerless pines, pellucid pushing, pour,
Eddy elate, enlarged, enchanting ease,
Calls cheerily; content conquers cold care;
Gardens grow glorious, gladiules grandly glow;
Lazily landward lingers Luna's light;
Far floats fine fragrance, flung from flowers fair;
Men, matching might, maturing meadows mow;
Nefarious, noisy nocturnes narrow night.

[Thos. S. Collier in Puck.

THREE WEALTHY MEN.—The relative wealth and income of the most opulent men living—the Duke of Wostminster, Rothschild, and Mr. Mackey the Bonanza King—has been reduced to figures, as follows:

	Duke of Westminster.	Rothschild.	Mackey.
Capital.....	£16,000,000 00s.	£40,000,000	£55,000,000
Per year.....	800,000 00	2,000,000	2,750,000
Per month....	60,000 00	170,000	200,000
Per day.....	2,000 00	5,000	7,000
Per hour.....	90 00	200	300
Per minute....	1 10	4	5

GRANDPA'S SOLILOQUY.

It wasn't so when I was young,
We used plain language then
We didn't speak of "them galoots,"
When meaning boys and men.

When speaking of the nice hand-write
Of Joe, or Tom, or Bill,
We did it plain—we didn't say
"He slings a nasty quill."

Then when we met a good, old friend
We hadn't lately seen,
We greeted him—but didn't say,
"Hello, you old sardine."

The boys got mad sometimes and lit;
We spoke of kicks and blows;
But now they "whack him in the snoot,"
And "paste him on the nose."

Once, when a youth was turned away
From her he held most dear,
He walked off on his feet—but now
He "crawls off on his ear."

We used to dance when I was young,
And used to call it so;
But now they don't—they only "sling
The light fantastic toe."

Of death we spoke in language plain,
That no one did perplex,
But in these days one doesn't die—
He "passes in his checks."

We praised a man of common sense;
"His judgment's good," we said;
But now they say: "Well, that old plum
Has got a level head."

It's rather sad the children now
Are learning all such talk;
They've learned to "chin" instead of chat,
And "waltz" instead of walk.

To little Harry yesterday—
My grandchild, aged two—
I said, "You love grandpa?" said he:
"You bet your boots I do."

The children bowed to strangers once,
It is no longer so—
The little girls, as well as boys,
Now greet you with "hello!"

Oh, give me back the good old days
When both the old and young,
Conversed in plain, old-fashioned ways,
And slang was never slung.

LORD LYONS, as British Ambassador to France, has a salary of $50,000. The British Ambassadors to Germany and to Rome have each a salary of $35,000, and the latter receives an allowance for rent of $6,000. The Ambassador at Vienna gets $40,000, and the one at St. Petersburgh $39,000. Sir Henry Elliott had at Constantinople $40,000; and Sir Edward Thornton entertains pleasantly at Washington on a salary of $30,000.

THE MELANCHOLY DAYS.

The melancholy days have come, the saddest of the year!
When Jersey's most pernicious bug doth serenade our ear.
And with its apex slitteth down, so frequently at night,
Upon the baitsome parts that seem most tempting for to bite,
That when the morning comes, we find our countenance so "meller,"
We can't tell whether we're ourself or some other horrid "feller."

[*Yonkers Gazette.*

"IF the gentleman who keeps the shoe shop with the red head will return the umbrella of a young lady with whalebone ribs and an iron handle to the slate-roofed grocer's shop, he will hear of something to his advantage."

THE HOT BRIGADE.—(TWENTYSON.)

BLAZED fierce the sun on high,
Scorched breezes rustled by,
Up went the mercu-ry,
Up to 100.

Sweltered the Hot Brigade,
O, the wild howl they made,
When shall its echo fade?
Frightful 100!

Ice to the right of them,
Beer to the left of them,
Cold tea in front of them,
Barkeepers blundered.

Swift up the bulb did hie,
Singing "Sweet By-and-by,"
Fahrenheit's mercu-ry,
Up to 100.

WHICH is the longest word in the English language? Smiles, because there is a mile between the first and last letters.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

A JAPANESE LOVER'S SERENADE.

THERE is a maiden.
There is a little maiden whom I love,
Her name it is easy to utter;
The night winds are always breathing it in my ear.
Something has been telling it to me all the night.
But who shall convey the extent of her beauties,
Or of the graces of her mind?
To others she is frigid.
But to me she is as the moon-beam, radiant and warm.

She is exempt from the ordinary weaknesses of women,
Her piety is the theme of admiration among all classes,
Her virtues are so lofty that they reach the stars.
She reads all the sacred books and knows them by heart.
With strong moral principles she immingles a cheerful spirit.
And her rich, black hair is involved in unctuous gum.

Numbers of costly ornaments shine in her hair;
They shine like clusters of stars relieved by a jet-black sky.
Soft, silken scarfs encircle her throat;
Oh! enviable, soft silken scarfs.
A radiant satin *obi*, of princely dimensions and incalculable price, enfolds her waist.
Oh! enviable satin *obi* of princely dimensions and incalculable price.
Her countenance needs not the additional glow of paint:
And her neck scorns the inferior luster of powder.
Her form is enveloped in many-colored marvels of millinery;
And her petticoat is embroidered with a hundred butterflies fluttering among flowers.
Her feet are atoms of celestial origin,
And her *kedashi* is the pink cloud which protects them.

To many her heart is hard and cold;
To them it is very beautiful porcelain.
To me it is soft and warm;
To me it is fresh-cut velvet.
Her lips are sealed, and words proceed not therefrom,
But in their place come sighs of aromatic fragrance.
Her family are conspicuous for antiquity.
And her father is of the true blood Fujiwara.
He possesses a great number of tiger skins,
All brought from Chosen and very valuable.
Myriads of *kobans* glitter in the strong chests of his *kura*.
But for me the greatest treasure—
The treasure beyond all, for me,
Is the little maiden,
The little maiden whom I love.

[*Tokio Japan Times.*

"FREE LANCE" NEEDS ENLIGHTENMENT.

MRS. ELLEN HUNTER.

I do not understand why Free Lance should speak as though Gail Hamilton were a representative woman. Beyond the mere fact of sex she has nothing in common with women, and so far from having identified herself with the movement for the extension of the elective franchise to women, she has persistently opposed every measure having for its object the freeing of our sex from disabilities of any sort—commercial, social or political.

No one readier than she to point out and expatiate on the foibles and weaknesses of women, and as her pen is usually dipped in gall, she has done effective service in wounding the sensitive, and in deterring timid women from making an effort to free themselves from thralldom of different kinds. Her unkind jeers at the shortcomings of those who have been suddenly forced, without adequate preparation, to support themselves, should earn for her the scorn of all women who have any self-respect.

No fault in her sisters has been too obscure for her to ferret out and parade to the world. The object was not to reform women but to show how superior Gail Hamilton was to the rest of the sex and in what contempt she held her weaker (?) sisters.

She has recorded it as her opinion that a woman should never argue the question of money with her employer, but either take what he offers or starve, which is precisely what she herself did not do. For when she disagreed with her publishers about a matter of dollars and cents, not only did she expostulate with them, but she published an account of the transaction and inflicted on the country at large a history of her private grievance. Ah! that the physician could but be persuaded to take his (or her) own prescriptions! It may be though that between the poor shop-girl who complains that $5 00 per week will not board and clothe her, and the famous Abigail Dodge quarrelling about hundreds of dollars there is a wide difference. If there is, I think then the shop girl is entitled to a monopoly of the sympathy.

It is a source of no little congratulation to those of us who are ambitious to be something higher than mere housekeepers and nurses that this virulent woman is "on the other side." I would like to ask Free Lance when and where Gail Hamilton ever advocated equal laws, equal opportunities, equal pay or the ballot for women, that he should think her one of us? Imagine his putting this champion vituperator in the same category as Mrs. Livermore, Mrs. Cady-Stanton, Miss Francis Willard and the many other refined and true-hearted women who have identified themselves with the women's movement.

Free Lance speculates on the possibility of Gail Hamilton being a fair sample of the "emancipated woman" that is to be. No, my dear sir, the "woman of the future" will be totally unlike her, for Gail is one who believes implicitly in "woman's sphere" as defined by men. She is a product of the hearthstone not of the rostrum, and our conservative friends who so dread the result of the extension of privileges and rights to women, are cordially welcome to this choice flower of womankind, who on all occasions has avowed her disgust at this clamor after rights. Take her and cherish her, but spare us the humiliation of being classed with her. She is none of us.

A LUCKY BREAK-DOWN.

J. E. M'C.

MRS. ACKLEY'S tin-ware had been ailing a long time, and yet she could never get the men folks to go a half mile out of their regular beat, when they went to town, to get it mended. By baying time the tea kettle, too, had sprung a leak, and and then she was at her wits' end.

"Silas, I *must* have that tea-kettle soldered up, or I never can get the meals for such a family," she said despondently.

"Try and get along somehow," he replied, indifferently; "We are just at the busiest, and can't spare a hand to go to town just for a tin tea-kettle. Plenty of folks never had a tea-kettle in the house, and they lived just as long."

With which conclusive argument he proceeded with his men to the business of the day. As if those broad acres of ripening grain could wait and waste for a woman's tea kettle! It was about as much "calculation" as women generally had!

A man who was hung for a blow that killed his wife, said sadly on the gallows: "I never meant to kill my wife, but she was a dreadful aggravating woman." So a good many men are dreadfully aggravating in the way they dispose of and dismiss the matter of woman's difficulties and hardships in doing work. A little sympathy and appreciation will make a woman surpass herself in ingenuity and self-sacrifice in getting along with about the resources of Robinson Crusoe. But when such things are demanded as a reasonable service, they become intolerable burdens.

Mrs. Ackley went back to her kitchen with little heart for her duties. That tea-kettle was in requisition about every hour in the day. It seemed as if the family supplies were half cut off. She would have set the tin pail on the stove and got along with that, but it leaked more than the kettle. All the basins had a string or a rag drawn into several air-holes, and the washboiler had, in reality, given out long ago. She managed her washing the best she could with her iron kettles. Mrs. Ackley was an excellent woman, kind and peaceable, but too easy for her own good. A little more self-assertion would have been better all around. She allowed herself to be imposed upon, and Silas was no better for it, rather the worse, because he was nourishing a bad habit which grew like a weed, and Canada thistles are a great deal more profitable to raise than such habits.

Things did not work well for him that morning. The reaper got some kind of a "hitch" that put everything back. At last, when they had vainly tried to make it work, a dozen times, Farmer Silas's patience gave out. He threw down the lines, and told Jerry to unhitch the horses. He would take "the pesky thing to town and see what ailed it."

The men stood grinning around, and a young chap remarked: "You'd better take your wife's tea-kettle along, too. It is as easy for you to work with broken tools as for her."

Silas's face reddened a little to see that the men had noticed how slack he was about the house-fixings, and he told Jerry to gather up what things wanted mending and he would take them along, as he had to go right to the tinner's.

The wash-boiler was filled on the double-quick, and several things besides tied on the handles. Silas looked a little like a tin peddlar when he set out. The men stood smiling around to see him start, and then turned to the wood pile, as directed, with a hearty good-will. A woman who got up such good dinners, with such poor facilities, deserved well of them, and the wood was sawed, split fine, and piled up in quantities not known before for months in that wood-yard. In fact, all things considered, that break-down of the reaper was the luckiest thing that had happened in all summer for the women-folks, and lightened the labor more than could be computed by one who had not gone through the same difficulties.

ORNAMENTATION WITHOUT MONEY.

LORETTA E. KNAPP-TURNER.

A GREAT deal can be done by way of home adornment without using any money, and in these hard times that is quite an item with some of us.

I saw a handsome picture the other day, made of lichens and moss, sticks, and other things, which had been picked up in the fields and woods. The scene was a landscape, with trees, a house, fences, hills and valleys, all composed of these common articles, but put together with such artistic skill, that it was very charming. Another lady has a rustic scene arranged on a foundation two feet square. There is a house made of tiny logs and covered with tiny shingles, made from old ones. There are doors and glass windows, a carpet and chairs, while outside an old-fashioned well-sweep contains a bucket, and a doll, dressed like a boy, stands by it with a pail on his arm. A woman at the door with a broom in her hand seems sweeping the steps. There is a creek formed of looking-glass and pebbles; and moss serves for grass.

Ferns artistically arranged help very much in home adornment, both when growing and when pressed and skillfully used.

A friend showed me a beautiful bed of ferns which she transplanted from the woods this spring. They require a shady place and considerable water. They look well when pressed in a book or between blotting-papers, to border lambrequins, or arranged in dainty baskets, and for many similar uses. I use them for spatter-work pictures.

These can be made very cheaply, and look fully as nicely after they are formed as those that are made of more expensive material.

I use cheap, white paper, shoe blacking, a blacking brush, and a fine sieve, only using a very little blacking at a time, and brushing lightly on the sieve, being careful to have each spatter very small. A great amount of artistic skill may be shown in making these pictures, both in the arrangement of the design and in the shading. Mottoes in spatter-work are very handsome. One picture I have even had a cross, with trees and ferns around it; back of one of the trees was a deer, and above was a moon and stars. It was shaded to look like moonlight. The designs are, of course, innumerable.

A great many pretty things can be made of straws. Dainty, little picture frames, delicate baskets, and vases for artificial flowers. They are far more durable than one would suppose they would be, and for variety the straws may have a tiny spiral winding of gilt paper or some pretty color.

ANSWER TO DAME DURDEN.

B. C. D.

I HAVE seen no answer to Dame Durden's inquiry in the RURAL, asking what indoor games would amuse little folks, and I thought I would tell how our little folks of 5, 7, 9 and 12 amuse themselves on wet days.

With a box of building blocks they build miles of railroad and box-stalls in which they stanchion the cattle from a Noah's ark; they fence the railroad that they "play" crosses their premises, and opening the gates turn out and drive the whole motley crowd of animals from the ark across the track to the pasture, in imitation of what they have often helped to do.

They build barns, and underpin them, windmills with towers, door-yard fences, and with the help of two tin horses on wheels, draw loads of sand for building purposes, Noah's family figuring as drivers. An occasional collision only adds to the variety of the entertainment.

From attending school exhibitions and Sunday-school concerts, they have caught the idea of giving some of their own, and the costumes they have devised, and the pieces announced by the pompous little usher, have often produced more merriment for the spectators than more elaborate performances of the older children. The pieces have ranged from Jack and Gill, by the youngest, to the Indian Chief's lament, and other sentimental articles.

The music, which always accompanies these entertainments, partakes of the same original character. The hat is frequently passed around at the close of the "concert," and a few pennies make the actors rich for the time.

Playing sick and calling in the Doctor, as well as consulting him about the doll, passes many a dull hour away pleasantly. Dominoes help to brighten the winter evenings for all, from the youngest upward. This is the way our little people entertain themselves.

A PRIVATE letter from Saratoga gives some interesting gossip about Mrs. Thompson, the lady who, last winter, presented the nation with Carpenter's painting, "Signing the Emancipation Proclamation," valued at $25,000. Mrs. Thompson is a widow of fifty-eight, though she appears much younger. Her income is $55,000 a year, derived from a fortune of about a million dollars. She never accepts more than five per cent. on her investments. Mrs. Thompson gives to the extent of self-denial. Her personal expenses, exclusive of the actual necessities of life, do not exceed $250 per annum, yet she gives away all of her large income and sometimes pawns her jewelry to raise money for some object of charity, redeeming them when she receives the next installment of interest. Although troubled with a slight lameness, she does not keep a carriage or a maid, and is as simple in her manners as a child. When in Washington last winter, Mrs. Thompson was entertained by Mrs. Hayes at the White House. After her visit she sent Mrs. Hayes a diamond pin in the shape of an eagle. Mrs. Hayes wore it twice in honor of the giver, and sent it back, saying that while grateful for so handsome a gift, as the wife of the President she felt obliged to decline all presents.

CELLULOID COLLARS AND CUFFS. I have received several inquiries as to where these articles can be purchased. A firm in Paterson, (Messrs. Simon & Van Emburgh), offer celluloid collars at 40c., and cuffs of same material for fifty cents per pair. Mr. Jos. E. Crowell, editor of Daily Guardian, Paterson N. J., writes us that he is now wearing a set which has been in use for several weeks. He adds, "I like them very much. They are thin and pliable as linen and are not affected by water."

THE hygienic undergarments, including the dress-reform corset, which are made and sold by Alice Fletcher & Co., New York, are constructed on what seem to be correct principles, and women who have a care for their health should make themselves acquainted with the new shapes and styles. An illustrated catalogue is sent free to applicants.

THE "Flow" used in opaline painting is a flowing varnish and it ought to be obtainable at any store where artists' materials are sold. Messrs. Bonta & Curtis photographers, Syracuse, N. Y. sell it at 50c. per bottle.

ONE of the oldest lighthouse keepers on the Atlantic coast is a woman. Kathleen Andre Moore, of Black Rock Lighthouse, near Bridgeport Conn. She is sixty-five years old, has tended the lighthouse lamp for fifty years.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

MOP-HANDLE PAPERS—NO. 4.

For a long time I have been anxious to obtain a washing machine that would require less physical strength to eradicate the dirt than the old-fashioned wash-board. But all that I had yet seen, required strong arms, strong stomachs, and plenty of back-bone; though all were recommended to be *easily* worked by a child of ten years.

Last winter my eyes rested upon an advertisement recommending the Little Washer, as the best machine ever offered to the public. The clothes were cleaned by the water passing through and through the fabric, and would require but little if any rubbing. I determined to have the labor-saving machine immediately; and forthwith it came promptly to order. According to direction, the clothes were to be soaked one night. In the morning the machine was put into a boiler nearly full of water, into which a spoonful of powdered borax was dissolved, and put over the fire. While the water was heating, the clothes were taken out of the soaking water, thoroughly soaped where soiled, with good home-made soap, and put into the boiler and boiled fifteen minutes. The water was drawn up through a tin pipe, poured over the clothes, then was drawn down again, and another jet spouted over.

Well, the little thing worked to a charm. All the clothes were taken out and put into the "sudsing" water, and the soiled parts were rubbed a little, and the dirty streaks disappeared almost immediately. Plenty of water was used in rinsing, and the washing was done two hours sooner, with less wear and tear of body and clothes.

Of course, I was exceedingly proud of my little machine, and was almost ready to fall down and worship the inventor.

But a few weeks ago my mother took the conceit out of me by following the directions for washing, only *leaving out the machine;* and behold the work was done equally well. Ever since, the little humbug has "lain upon the shelf." It has not been useless, however. It has taught me that clothes can be well cleansed with one-fourth the rubbing usually given them, thus saving the fabric and our own strength. And there are, no doubt, many hard-working RURAL sisters, who, having not an overplus of silver dollars, will be induced to try the plan, and thus save *their* money, clothes and strength for other services, where they are more necessary to the happiness of the human family.

MAY MAPLE.

"REGALIN."

We have seen and tasted samples of fruit preserved by Mr. C. Amende's "Regalin." It is a chemical salt, we should say from its taste, and is designed to preserve fruits, meat, vegetables, eggs and articles of like nature. It seems to do the work most satisfactorily. The fruit we inspected had been in a state of preservation during six months, and the pears we tasted had a fine flavor, and were in no wise affected injuriously by the preparation. We should think the powder (which is put up compactly in small boxes) would prove to be of great usefulness to housewives. The advertisement in another column furnishes details.

DOMESTIC RECIPES.

Sweet Corn Soup.

This is very nice when properly made and seasoned. The outer part only should be cut, and the rest scraped from the cobs, the same as for drying. Add as much water as there is corn, and boil slowly, fifteen minutes, pouring in a little more water should it boil dry. Then add three pints of rich milk to ten ears of corn; add salt; butter as much as you choose; let come to a boil and serve hot. I prefer the use of sweet cream to milk, in which case the butter may be omitted, or at least less used.

AUNT FLORA.

Pepper Chow-Chow.

Cut in half, and remove the seeds from twenty-five peppers; soak in salted water for three or four hours; chop fine and add twice as much chopped cabbage as peppers; one tablespoonful each of ground cloves, allspice, mustard seed, whole—and salt; mix thoroughly; cover with cold vinegar, and tie down.

Wild Plum Marmalade.

Wash, put into a porcelain kettle, with water enough just to cover; let boil until soft, pour into a colander and drain; then press the pulp through and add a pint of sugar to a pint of pulp. Boil from twenty to thirty minutes, stirring constantly.

Tomato Preserves.

With a sharp knife remove the skins from Green Gage tomatoes; prick each tomato several times; add an equal amount of sugar by weight; let stand over night; then pour off the juice into a preserving kettle; add two or three slices of lemon, and boil until it thickens; clarify the sirup; add the tomatoes, and boil gently until they look transparent.

E. M.

Apple Float

One pint of good, stewed apples, which are free from lumps, whites of three eggs, well beaten, four tablespoonfuls of powdered sugar. Beat the apple, eggs and sugar together until stiff enough to stand alone. Make a soft, boiled custard; flavor with vanilla; pour into a deep dish, and pile the float on top.

Tomato Catsup.

Wash and remove the stems from one peck of ripe tomatoes; crush, and put on to boil in a porcelain kettle until the pulp is dissolved; press through a fine sieve and boil five hours, adding two ounces of salt, one ounce of mace, one tablespoonful of black pepper, and one teaspoonful of red, one tablespoonful of cloves, seven tablespoonfuls of mustard, one of celery seed—tied in a bag; stir almost constantly. When done, turn into a crock to cool, and when cold, take out the bag of celery seed, add one teacupful of vinegar. Bottle, seal and keep in a cool, dark place.

MARY B.

Head-Ache.

Simple remedies are frequently the best for this distressing complaint. A curd of sour milk spread upon a thin cloth and applied to the head will many times give relief. Or, a mustard plaster on the back of the neck will often ease the pain.

R.

Corn Pone.

No. 1.—Two cups of wheat flour; one cup of corn meal; two heaping teaspoonfuls of baking powder; one even teaspoonful of salt; a cup, one-third full, of sugar; three eggs well beaten. Sweet milk added to the mixture sufficient to make it run nicely from the spoon. This makes two cakes in flat tin.

No. 2.—Beat one egg with a third of a cup of sugar; add one tablespoonful of melted butter; beat a little and add one pint of sweet milk; two and a half cups of meal; one-cup of flour; a small pinch of salt; one teaspoonful of soda and one of cream-of-tartar.

These are both good, well-tried recipes. No. 2, however, I think the nicest.

MRS. MARY OLIN.

Cottage Pudding.

By request we republish this recipe given in the RURAL of August 11, 1877, page 90. One cup of white sugar; one-half cup of butter; two eggs; two-thirds of a cup of milk; one teaspoonful of soda and two of cream-of-tartar; three cups of flour. Sauce for the above: one cup of sugar; one-half cup of butter; a tablespoonful of corn-starch. Mix together, add two cups of boiling water; boil two or three minutes, add wine, brandy or any flavoring you chose. The success of this pudding depends upon the sugar, butter and eggs being well beaten, and upon being served the instant it is done.

QUERIES ANSWERED.

Ice Cream.

"Subscriber" wishes a recipe for *eggless* ice cream; she finds it difficult to make it smooth. We append several from which choice may be made:

No. 1. Two quarts of rich sweet milk; one pound of granulated sugar, or a little more if liked very sweet; three heaping tablespoonfuls of corn starch; wet the starch in a little of the milk; scald the milk by putting it into a tin pail and setting it in a kettle of hot water; when it boils stir in the sugar and starch, and let boil for a few minutes longer; strain, let cool, flavor and freeze.

No. 2. One quart of milk; two quarts of cream; a pint and a half of powdered sugar; a tablespoonful of vanilla.

No. 3. Two quarts of new milk; a small teacupful of flour; put the milk on to boil in a tin pail in a kettle of boiling water, the same as above, reserving enough to mix the flour smoothly; when the milk boils stir in the flour, and boil ten minutes longer, adding a pound and a half of sugar just before taking from the fire; stir constantly after the sugar is added and only let remain long enough to dissolve it; strain through a towel, and when cool add a quart of cream, and flavor with lemon.

No. 4. Take one quart of sweet cream and make very sweet with the best sugar; flavor, whip to a light froth; skim off as fast as it is beaten, and put into the freezer. Continue beating until all is a light froth, and freeze at once.

If the cream be properly beaten and scraped from the sides while freezing, providing it was free from lumps at first, we see no reason why it should not be smooth.

WANTED.—A recipe for the preservation of pictures without glass, for I find it expensive to buy glass for large ones.

W. W. F.

ANS.—We take the following from our selected recipes: Dilute one-fourth pound of Venice turpentine, with a gill of spirits of wine. If too thick, a little more of the latter; if not enough a little more of the former. It should be of the consistence of milk. Lay one coat of this on the right side of the print, and when dry it will shine like glass. A second coat may be necessary.

News of the Week.

Monday, Sept. 9, 1878.

POLITICAL.

BEN. BUTLER having issued what his bitterest foes own to be a strong letter of acceptance of the curious nomination for governor lately tendered him, is vigorously canvassing Massachusetts in his own behalf. Most of the high-toned papers and people have always been bitter in their denunciation of him and his views, and now fear is adding to their bitterness. Ben., however, is case-hardened to vituperation, seems to be making good headway and is about to go West soon to support that "odious" greenback doctrine of his. The election up in Vermont has gone republican by about 17,000 majority, a decrease on last years'—but this is an "off" year, you should know.

Kearney—Dennis of that name—has been swinging wildly round the circle lately in the East here. He visited Hayes in Washington and thinks him a very good sort of man in a private capacity, but poor stuff for a president—some people who have never been thought crazy agitators have, so far as my memory serves, been guilty of a similar opinion. He saw most of the Cabinet and doesn't think much of any part of the article—and here, again, it's marvelous how the opinion of a lunatic sometimes coincides exactly with that of folks generally considered very sane indeed. He insisted on speaking from the steps of the Capitol, mainly because there was an antique law against such a proceeding. The Quaker City next was shocked with his profanity, and then Newark, N. J., and Jersey City—at least the roughs of those places—listened to his ravings. Next he addressed a large crowd on Union Square in this city, and several of the newspapers which he had been vilifying, took a fearful revenge upon him—they published a verbatim report of what he meant for a speech. Respectable papers, as a rule, omit all remarks objectionable on the score of scurrility and profanity, but had this rule been followed in Dennis' case, there wouldn't have been as many paragraphs as there actually were columns occupied by his lucubrations.

Lately he has got into the habit of having the hat passed round after his harangues, for the purpose of collecting enough to pay his way—and the newspapers are fond of poking fun and sarcasm at him there anent. But if the devil should get his due, surely there's no reason why one of his imps should not, and really there's nothing out-of-the-way in this mode of scooping in the "stamps." As a rule, all political speakers get paid—and well paid too—for their laudation of party men and measures. True, their pay is collected from the public by organized party management, but Kearney is his own party organization, and perforce must differ somewhat in his methods from mere complicated organizations.

MISCELLANEOUS.

What a rush into bankruptcy there was a week ago of "lame ducks" in this State anxious to get the benefit of the lenient bankrupt laws of the United States as a nation! The registrars in bankruptcy must have made a glorious haul of fees. Whole columns in the papers were crowded into small type with the names of defunct firms, though only the bare names of the most important concerns were given. In the last two days here there were 535 names. Chicago beat this, 375 having filed their names on the last day of grace, while in steady Boston 234 did the same. The United States' laws with regard to bankruptcy came to an end on the first of the month, and henceforth, for a while at least, the laws of each State must regulate bankruptcy proceedings. These differ considerably, some being lenient towards the debtor, especially in the South and West, others in favor of the creditor class, as in the Eastern States where capital most abounds. It hardly speaks well for the aggregate wisdom of our Congressional Solons that they confess themselves unable to devise a satisfactorily uniform system of legislation on this matter.

The other day Rarus, the celebrated flyer, trotted at Hartford, Conn., and was the innocent cause of much swindling. Besides the inevitable betting, and its concommitant black-legging, at least four open swindles were allowed on the ground; namely, the pool-box, the wheel of fortune, sweat-boards, and the pill-box trick. At the wheel several fools parted with over $100 apiece in less than an hour. The sweat-board was well patronized by green-horns, and gamblers were kept profitably busy selling their trade dollars, to bet with, for greenbacks. The pill-box man would show three or four empty boxes, pretend to put a $20 bill into one and offer to sell the boxes for $5. The dupe, seeing what he supposed a corner of the $20 bill sticking out of one of them, would invest his five, only to find a dollar instead of a twenty-dollar bill. As such tricks will be not uncommon at or near the approaching fairs, farmers and their children will save the price of many a RURAL by carefully giving them all the "go-by," however certain they may feel that their unsophisticated wits can get the better of the practiced trickery and knavery of the gentry who "run" such "institutions."

Yellow fever is still on the increase in severity in the South, while its ravages are spreading over a much larger extent of country. Even the telegraphic details of the destitution, misery and deaths throughout the infected districts are heart-rending—much more terrible, however, would be the sight of the woebegone scenes. In all the large and in most of the small towns and even villages throughout the North, societies have been organized for the purpose of collecting money to relieve the dire distress of our suffering brethren of the South, but despite the liberal donations hitherto given, upwards of a million dollars will be absolutely needed to prevent numbers from dying from want before the first black frost puts an end to the pestilence.

All work is at a standstill. No money is obtainable by the poor except in the shape of charity, and if ever charity was, not a matter of choice, but of absolute, imperative duty on every citizen as well as on every Christian, surely now is the hour. The Northern cities are doing nobly, shall the brave, honest, generous-hearted Northern farmers be backward in this hour of a kindred people's agony? Heaven and manliness forbid such a disgrace! Let every farmer and every farmer's family contribute their mite towards feeding the hungry, tending the sick and burying the dead throughout the now desolate regions of the once sunny South. Send on your contributions, separately or clubbed together from every neighborhood, to the Howard Association in each of the afflicted towns, and they will be nobly used. Then the thought can never afflict you in years to come, that you were craven enough to turn a deaf ear to the death cry of a noble people in the hour of their bitter agony.

On Wednesday last Sec. Schurz rendered an additional decision in the case affecting land grants to railroads. An appeal had been taken for a reversal or suspension, and this was peremptorily refused, so that the former decision, by which large tracts of excellent land were opened to settlement, must stand unless reversed by a decision of the courts. The land can be pre-empted through the regular government agents, who pay the price of it over to the railroad, and nothing except a previous *bona-fide* sale by the railroad company can prevent its pre-emption at $1.25 per acre. All information with regard to the lands thus thrown open to settlement can be obtained by means of a letter of inquiry to the Department of the Interior, Washington, D. C. Already an immense number of applications have been made to "enter" the lands, and the railroads are reported to be taking steps to appeal to the courts.

Diaz has virtually abolished the *zona libra* or free zone along the Rio Grande. This was a strip of Mexican territory, stretching along the frontier, into which goods could be carried free of duty. This immunity drew to it a large number of smugglers and other desperate characters who have been, in great part, the cause of our border troubles. A few towns only still retain this franchise. Now comes the report that Edison has mortgaged his inventive genius to the Western Union Telegraph Company for 34 years, for an annuity of $6,000 a year, in return for the exclusive ownership of all his possible inventions.

Some time back the Protestant Episcopal Bishop of Michigan, Dr. McCoskry, an old man of upwards of seventy years, was accused of immorality with a young girl he had adopted and whom a short time previously had been married by him to a young man in the neighborhood. Letters of his, it was said, were in existence that would fully convict him—oh those letters! Just before the accusation was made, he had resigned his See and was on the point of starting for Europe. When thus shamefully accused, he withdrew his resignation, denied the charge and demanded an investigation. Afterwards, however, he deemed it prudent to again tender his resignation and avoid investigation by promptly crossing the Atlantic. Last Tuesday, at a meeting of Episcopal Bishops, his resignation was not accepted, but he was deposed not only from his Episcopal office, but also from the ministry for having abandoned his diocese and left the country while grave allegations touching his moral character existed, thereby declining to permit any investigation into the truth of the allegations. 'Tis fortunate that the flood-gates of another monstrous scandal have not been opened on the community. So long as there was a hope of the innocence of the aged and hitherto blameless pastor, it was thought best not to speak of the matter here, now it is mentioned as a bit of news.

FOREIGN.

On Tuesday last the excursion steamer Princess Alice, returning from Gravesend to London with about 500 passengers, was run down off Barking by a screw steamer. In five minutes the vessel sank and the bosom of father Thames was a mass of struggling, shrieking humanity. There was a great number of children on board and of these nearly every one was lost. The scene was horrible. Already about 640 bodies of the victims have been recovered, more have been swept down by the current to the Channel, and altogether the victims of this pitiful calamity are estimated at fully 650.

Americans with antiquated claims to vast English estates, have hitherto had but slim chances of ever realizing a cent for every dollar they may have been foolish enough to pay lawyers for investigating and asserting their supposed rights. But now, even their slim chances are on the point of vanishing, owing to a new property limitation Act which goes into operation with the commencement of next year. This Act debars all claims older than a dozen years by giving absolute possession of land to tenants who have uninterruptedly occupied it for that period, without paying rent or in any other way acknowledging the title thereto of any other person. A law of this nature would be a boon in this country, also, where old musty claims to land are often sprung, by God alone knows whom, upon those who have honestly paid for it and held it peacefully for years or even generations.

The French harvest is very good in two departments; good in 12; fair in 13; poor in 46; and

bad in seven. The Austrians are still meeting with a stubborn resistance to their occupation of Bosnia, and despite heavy reinforcements are advancing but very slowly. Indeed the latest news seems to indicate a firm resolution on the part of the insurgents to die rather than suffer themselves to be handed over from one Power to another without the slightest regard to their wishes in the matter. About a week ago Mehemet Ali, formerly the famous commander-in-chief of the Turkish army on the Lom and quite recently one of the two chief representatives of the Porte at the Congress of Berlin, was sent from Constantinople into Albania to assert there the Turkish authority and prevent the inhabitants from aiding the Bosnians in their resistance to Austrian invasion. Last Thursday he was surrounded by a party of Albanians who urged him to organize resistence to the Austrians; the old veteran stoutly refused, whereupon the enraged peasantry fell upon him and massacred him together with twenty of his escort, and the next day, to cap the climax, they saturated, with petroleum, the house in which his corpse lay and burnt the building and its contents to the ground.

HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 7, 1878.

BEANS AND PEAS.—With confirmed information respecting late curing of new beans prices for mediums and marrows have ruled firm without showing an excited advance. Holders of the latter are not offering strictly prime freely, as they will be wanted even when new come in, as buyers are always more or less doubtful about the keeping qualities of earliest receipts. Pea beans and white kidney are quoted strong in sympathy with the standards. Shippers of red kidneys must not be deluded with the idea that closing prices will open new crop, or anything like them. Sellers will not assure $2.50 a month hence, notwithstanding $3.55 has been recently paid. Canadian peas have a light demand and the stock is moderate; quoted, in bulk and bond, '77s, 78c. Green peas, '77s, $1.38; new, $1.40. Four bags Southern B. E. peas arrived Friday and sold at $1.25 ₱ 2-bu. bag. Beans, medium, prime, $1.52½@1.55; fair to good, $1.40@1.47½. Marrow, prime, free on board vessel, $1.52½@1.55; fair to good, $1.40@1.47½. Pea, $1.35@1.55. White kidney, $1.35@1.50. Black (turtle soup), $2.40@2.50.

BEESWAX.—There is a very meager business but prices steady; Western and Southern quoted 27@28c.

Exports since Jan. 1st 115,607 lbs. Same time 1877, 89,859 do.

BUTTER.—There has been a steady demand and not much pressure of supplies. The latter circumstance is a fortunate one as foreign shippers have slackened their purchases. Dealers expect a good call from them when the weather will permit safe exportation without the use of refrigerators, and a consequent reduction in freight expenses. As before, nothing warrants stiff prices. The demand for July and August make will shrink as June packings are released and as buyers get a taste of fall receipts. In many of the lines of July and August hot weather has produced a cheesy summery flavor that will condemn them later on. A few State dairies have brought 20c. Western butter is running poor in quality. More dairy is selling at 13c. and under than in the upper ranges. In factory packed a good deal of milled, and the best of it cannot be quoted above 10c. Creameries, either State or Western, are not running evenly good, and under figures frequently represent the wholesale business in them.

State dairy, pails, choice, 19@20c.; other, 14@18c.; half tubs and pails, choice, 18@19c.; other, 14@17c.; Welsh tubs, choice, 17@18c.; other, 14@16c.; poor State, 10@12c.; creamery, best, 23@23c.; good, 19@20c.; sweet cream, 19@21c.; Western creamery, best, 21@22c.; other, 14@20c.; Western dairy, selected, 13@14c.; fair to good, 10@11c.; factory, best, 10@12c.; fair to good, 8@9c.; very poor, 6½@7c.; grease, 4@6c.

Receipts and exports past three years, from June 1st to date, were as follows:

	Receipts, pkgs.	Exports, firkins.
June 1st, '78 to September 1st, '78...	419,882	98,170
June 1st, '77 to September 1st, '77...	394,071	65,885
June 1st, '76 to September 1st, '76...	320,420	28,362

Receipts for the week 29,750 pkgs.; Exports, 11,634 pkgs.

COTTON has been feverish and irregular. The Liverpool market at the close is weak, and this operates against the Southern advices. Latest prices are for September, 11.48@11.49c.; for October, 11.18@11.18c.; for November, 11.02@11.03c.; for December, 10.97@10.98c.; for January, 10.98@10.99c.; for February, 11 04@11 05c.; for March, 11.11@11.12c.; for April, 11.19@11.21c.; for May, 11.27@11.28c.; June, 11.33@11.35.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	10¼	10¼	10⅜	10⅜
Strict ordinary	10 11-16	10 11-16	10 13-16	10 13-16

Middling fair	13⅛	13⅛	13⅛	13⅛
Fair	13⅜	13⅜	13⅜	13⅜

Stained.

Good ordinary.....10⅜; Strict good ordinary.....10⅜
Low middling.....11⅜; Middling.....11¾

CHEESE.—Receipts have been much smaller this week and this indicates the strong feeling prevailing among factorymen on their current make. Meagre offerings of fancy stock have tended to rather a stronger range of prices, and 8¼@8¾, and in one or two cases 9 made. The good and lower grades are but little wanted, shippers neglecting them and they are unsettled in price.

Quotations are: Fancy at 8¼@8¾c.; 7¼@8¼c. for good and prime; 6@7¾c. for fair to good; 5½@7c. for half skimmed; 3@5c. for skimmed. State, farm dairy at 7¾@8c. for good to choice, 6@7c. for fair to good, and 3@4½c. for poor skimmed. Wisconsin factory, fine to fancy, 8¼@8¾c.; do. good to prime, 7@8c.; do. fair, to good, 6@7c.; Western factory, fine, full cream, cheddar, 7¼@8c.; do. fine, full cream, flat, 7¼@8c; do. slightly skimmed, flat, 6¼@7c.; do. half skimmed, 5@6c.; do. full skimmed, 3@4c.

Receipts for week, 67,290 boxes.
Exports for week, 50,453 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 44s.

COMPARATIVE RECEIPTS AND EXPORTS FOR THE LAST THREE YEARS.

	Receipts, boxs.	Exports, lbs
June 1, '78 to Sept. 1, '78.....	1,502,377	71,312,100
June 1, '77 to Sept. 1, '77.....	1,234,931	56,631,516
June 1, '76 to Sept. 1, '76.....	1,015,464	45,769,285

DRIED FRUITS.—In Apples the only grades that move at all satisfactorily are the upper qualities of sliced—these to the jobbing trade. Peeled Peaches hold firm in price, as also small fruits generally. New blackberries, are quoted at 5¼@6c. Peaches—Peeled, new Georgia, 5c. for poor, 7@8c. for fair to good and 8½@9c. for prime; choice North Carolina 10c@11c.; unpeeled old halves, 3@3½c.; quarters, 2½@3¼c. Pitted cherries, 15@16.; southern plums, new, 9@10c. Apples—Old State quarters, 3@4c, do, sliced prime, 4½c.; do. good, 3¼@4c. New apples 3@4c, for southern quarters in bbls.; 4½@5½c. for prime sliced, and 6@7c. for fancy. New raspberries, 23@24c., and evaporated, 5@26c.

Exports past week 106 bbls. apples; since Jan. 1st 10,961 do.; this week, 1877, 25,900 do.

EGGS.—Receipts for week, 5,527 bbls.; do. last week, 6,162 do. Weakness has been the prevailing feature of the week, but at the close there is some recovery. Near points, 17½@18c.; State and Penn., 17@17½c; Grouse, pair, 75c.; Partridges, 80@85c.; Woodcock; 75c.@85c. W. & S. stall-fed pigeons, doz., $1.25@1.50, flight, $1. Snipe scarce. Western wild Ducks begin to show, quoted 30@60c., the latter for Mallard.

FLOUR.—The receipts have been large and prices have ruled easy on other than shipping extras.

Latest prices are $3.85@3.90 for very inferior to fancy superfine State; $4.00@4.20 for poor to good extra do, odd lots and lines; $4.25@4.50 for good to choice do.; strictly choice lots above this; $3.35@3.90 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c., $3.90@4.20 for inferior to good shipping extra do. and $4.30@4.50 for good to shipping extra do.; common to about choice white wheat extras, $4.30@5.40; choice to about fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.10@5.05; round hoop Ohio at $4.00@4.30, and trade and family brands of do. at $4.35@5.55, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.25 for good to fancy; Minnesota clear, very inferior to very choice at $4.25@6.00 (fancy brands at higher prices); Minnesota "straight," inferior to very fancy, at $5.25@7.25, and patent fair to strictly fancy at $5.75@8.75; unsound stock at from $2.40@5.00; city mill extra at $5 05@5.25 for West Indies (the latter rate for fancy in new packages); do. for England, 4.10@4.15; do. trade and family extras, $5.50@6.10; do. for South America, $5.40@6.00 for fair to fancy; No. 2 $2.25@3.20 for inferior to very fancy, the latter an extreme.

CORN MEAL.—Sales at $2.90@2.95 for Brandywine and $2.40@2.75 for yellow Western.

FRESH FRUITS.—Apples are in large supply and lower; fancy were selling up to $2@2.50 early in the week; now, $1.75 is extreme. Windfalls of any kind have no market when prime are so low. We quote Porters and Orange Pippins, $1.25@1.50; good common and Golden Sweet, $1@1.50, open heads. Gravenstien Malden's Blush and Twenty Ounce, $1.50@1.75. Bartlett Pears arriving ripe, and buyers purchase cautiously. Good, clear green, ₱ bbl., $5.50@6; poor to fair, $3@5; Seckel, $4@6; other table pears, $3@4.50; cooking, $1.50@2. Plums will not prove a large crop, and prices are steady. Quackenbos, ₱ bbl. $8@10; Green Gages, Reine Claude, $2@7; Damson, $5@5; Blue Gages $4@4.50; common and Lumbard $3@4. Samples of State raised German Prunes have met with great favor from fancy retail buyers; sellers urge its cultivation. Grapes are low for the bulk of the offering. Fair to good Concords and Hartfords 3@5c., choice up-river Concords, 7@8c.; do. Delawares 9@10c. Whortleberries, ₱ bush. $1@2.—Peaches have run so poor in quality that buyers are leaving them for other items. Crates not wanted. Best lines now coming from N. J. Good to prime Del. ₱ basket, $1@1.25; common, including Smocks and White, 50@87c. Extra N. J., $1.75@2; good, $1@$1.25; common, 50@75c. Watermelons steady at $15@$20 ₱ 100, for selected; $10@15 for good grocery sizes; small, $8@10; culls as low as $5. Nutmeg melons, have declined. Hackensack or best, $1@1.25 ₱ bbl. Keyport, 25@75c. Peanuts are dull in view of a large Va. crop. Good to prime $1.15@1.25; fancy $1.25@1.30, Hank-picked, $1.45@1.50. Hot-house grapes, 8. Hamburg and Muscat ₱ bbl., 40@50c.; Sweet Water 20@25c. Exports of apples for week, 289 bbls.

GRAIN.—Wheat has been in large receipt, the export demand not as brisk, and prices lower.

Latest sales are of No. 2 red, steamer grade, at $1 05@$1 07; ungraded red, at 96c.@$1 11; red State, steamer grade, $1 07; No. 2 amber at $1 07¾@1 08¼; No. 2 amber, steamer quality, $1 06@$1 07; ungraded amber, in lots, at $1 03@1 11¼; extra white at $1 19; white State at $1 16@1 17; old No. 2 Milwaukee spring at $1 13¾@$1 14; new No. 2 Chicago spring at $1 09@$1 09½; do., old and new mixed, at $1 08; new No. 3 spring, part at @1; New York No. 2 spring, September option, at $1 04¼@$1 04¾; do., October option, at $1 02¾@1 03; No. 1 white, early deliveries, at $1 15@1 16; do., last half September, at $1 16; do., late September and early October, at $1 16@1 16½; No. 2 white, nearby delivery, at $1 11@1 12¼; No. 1 red and amber Michigan; early delivery, part at $1 11; No. 2 red, nearby deliveries, at $1 08¼@1 08¾; do., September option, at $1 07¾@1 08; do., deliveries in September, at $1 08¾, do., October option, at $1 03¾@1 08¾; No. 2 amber, September option, at $1 08; do., October option, at at $1 08@1 08¼. Rye at 61@62 for western, and 62@64 for State. Corn has been less active on export account and prices have been easy; latest sales are of New York No. 2, September option, at 49¾@50c.; do., October option, at 51¾c.; November option, at 53¾c.; steamer mixed, September option, at 49c.; do., October option, at 51@51¾c. The spot lots: Kansas at 50c.; steamer mixed, 49@49¾c; New York No. 2 at 49¾@50c.; New York No. 3 at 48¾@49c.; New York No. 2 white, at 53¼c.; western yellow at 52¾c.; and western white at 55¾@56c. Oats have been fairly active at steady prices; latest sales are of New York No. 1 33c.; New York No. 2 30¾@31c.; New York No. 3 at 28@27c.; rejected at 26c.; New York No. 1 white at 38¾c.; New York No. 2 do., 31c.; New York No. 3 do., at 27¾@28c.; New York extra quoted at 34c.; white western at 28@37c.; mixed do. at 25@33¾c.; White State at 31@37c.; mixed do. at 29@33c.

HAY AND STRAW.—Retailing qualities have a fairly active sale, and they hold steady in price. Shipping qualities are plenty and easy. Sales at 45@50c. for shipping and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports past week, 280 bales; since Jan. 1st, 42,380 bales; same time, 1877, 33,803 bales.

HOPS—Inactivity has been the ruling feature of the market the past week, and prices for '77s are entirely nominal. About 100 bales of the new growth have thus far been received here, from which sales have been made at prices ranging from 25c. down to 16c. The first bale sold at the former price. Nearly all the dealers have been receiving a few bales and prices have receded until now the best will not bring over 18c., while the low grades; such as have been poorly picked, overdried, there is no sale. We have not had as lively a demand for early hops as characterized our market a year ago.

Quotations are for New Yorks, new crop, 16@18; Eastern, new crop, none; Wisconsin, new crop, none; Yearlings, growth 1877 (nominal) 5 to 12; Pacific coast hops, growth 1877, 9 to 10.

PROVISIONS have tended lower on liberal supplies and a slow export demand. Mess pork on spot quoted at $9.60@9.75; do for September and October at $9.40@9 50, and November at $9.10@9.50. Bacon at 6¾c. for long clear. Lard at $7.05 for spot lots; $7.00 for Sept. and Oct.; $6.97@6.97½ for Nov. Stearine at 8c. for choice. Tallow at 7c. for prime. Beef hams fresh Western, 15@16½c.; do. Canadian, 16½c.; Inferior parcels, 15@15½c.

POULTRY AND GAME.—Both live chickens and fowls have favored buyers during the week. Ducks are slow, mostly arriving too young and thin. In former times Jewish buyers would take such stock and fatten it at home; this is no longer permitted by the authorities, so ducks and geese had better be made good on the farm.

Chickens, N. J., 12½@13c. lb.; State and Penn., 12@12½c.; Southern and Western, 11@11¾c. Fowls—N. J., 11@11¾c.; other, 10@11c. Roosters, 5c. Turkeys, choice, 12@14c.; other, 10@11c. Ducks, prime, pair, 50@75c; other, 40@45c. Geese, N. J., $1 50@2; W. & S., $1@1.25.

Dressed poultry is quoted easy, owing to the abundance and cheapness of live; and our outside quotations are extreme.

Dry picked and prime N. J. turkeys, 15@16c.; other, 13@14c; chickens, fancy, 14@16c; N. J., 13@14c.; other, 10@12c. Dry picked fowls, 13@14c.; good to prime, State & N. J., 11@13c.; poor to fair, odd lots, 9@10c.

Game has a fair list and prices are steady. Trapped at $20. Beef—Extra mess, $11.25@11.50; plain mess, $10@11; packet, $11.25@12 for bbls.; extra India mess, $18@20 for city brands; do. Philadelphia, $17.75@18.

TOBACCO.—Export trade has been fairly active, and the home demand brisk, and prices ruling firm.

SEEDS.—Grass are dull; new timothy in small lots selling at $1.35@1.40, but larger parcels to arrive offered lower. Rough flax at $1.45@1.50.

VEGETABLES.—Exports of potatoes, past week 2,016 bbl.: of Onions, 147 do. The shipping demand has subsided, but the recent free sales and moderate receipts allow firm prices. Sweet have an unusually early good demand. Celery has appeared of good size, quoted $1.25 doz.; Sweet corn, 100, 75c.@$1; Lima beans, bag, in pod, $1@1.25; shelled, $3.50@4 bush. String beans, bag, 75@80c.; Cucumbers, small to large, 1,000, $1@2.50; Tomatoes, ⅜ peck packages, 20@30c.; Onions, white, bbl., $1@1.50; red Chester and Conn., 75c.@$1.20; Marrow Squash, $1.50@1.75; Peppers, Bullnose, bbl., 75c.@$1; Beets, 75c.@$1; Lettuce, bbl., 75c.@$1; Cabbages, 100, $3@5; Egg Plants, bbl., $2; R. turnips, $1.75@2.; Carrots, bbl., $1@1.50; Okra, 100, 12@15c.; Pumpkins, 100, $4@6.

WOOL.—Manufacturers have been buying sparingly, and the temper of the market has been a little favoring buyers on the better grades of fleeces, but medium stock is held firm.

Quotations are—Ohio, Pennsylvania and West Virginia—XXX and picklock, 40@43c.; XX, 36@38; X, 34@37; No. 1, 36@38c.; No. 2, 33@36c; coarse, 30@32c. combing, 40@45c.

Illinois, Iowa and Minnesota—XX, 34@35c.; X, 32@34c.; No. 1, 33@35c.; No. 2, 29@31c.; coarse, 25@27c.

Georgia, Alabama, Mississippi and Louisiana—Fine unwashed, 27@30c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@16c.

LIVE STOCK MARKETS.

Saturday, Sept. 7, 1878.

BEEVES.—Receipts for the week, 12,350 head; do., last week, 10,859 do. Unseasonably warm weather, heavy supplies on the hoof and an overstocked dressed meat market are not favorable contingencies for business at the yards, yet salesmen this week have had to contend against them all. Quality of stock also has run poor, and that always tends to make trade irregular. Ordinary to fair Texas and Cherokee cattle brought 6¾@7¼c., to dress, 55 lbs., but Colorado, to dress, 56 lbs., 8¼c. Poor to prime Native steers, 7¾@10c., to dress, 54@55 lbs. At the extreme close the market looked a little brighter.

COWS AND CALVES.—One of the profitable periods for butter is approaching, and it is not likely that many good milkers will find their way here for a time. Dealers give a wide range of $35@60, for common to good stock, with a fine milker occasionally at $65.

VEAL CALVES.—Receipts for the week, 3,273 head; do., last week, 3,622 do. The market is easy. Coarse to prime fed, 5@6¾c; buttermilk and grassers 3@3½c.

SHEEP AND LAMBS.—Receipts for the week, 28,688 head; do. last week, 26,635 do. With moderate receipts the demand has been fair. Ordinary to fair quality sheep, 4@4¼c.; good to prime, 4¼@5c. Lambs are low as a rule; general sales, 5@5¾c.; extra Jersey, 6@6¼c.

SWINE.—Receipts for the week, 18,853 head; do. last week, 22,233 do. Live hogs weak; closing prices, 4¾@6¾. A few N. J. dressed pigs quoted, 6¾@7¼c.; even fair receipts would not command these figures.

Reading for the Young.

FAMOUS PRINTERS.

In early books the printer comes before us as an artist, and not as a craftsman. His work is often more interesting than his author. He became, in effect, a patron of literature. He had to make a good and wise selection, for the printing of a volume was no trifling investment. Thus printer and author go side by side, as publisher and author have gone in later days. Caxton and Chaucer are associated as indissolubly as Scott and Constable. Most of these old books were what we should call standard, and many of them were law books. Thus, William of Machlinia, is chiefly known as the printer of the first edition of "Littleton's Tenares." It is a small folio volume, printed in a coarse Gothic letter, without a date, but issued from his office.

But the most eminent of Caxton's successors was Wynkyn de Worde. He was probably an apprentice, certainly an assistant, of our printer, worked with him at Westminster, and issued books from the same office after his death. Like Caxton, he was a master in his craft, and introduced many improvements in the new invention. His works are admirable for their neatness and elegance. He designed and cut his own punches, sinking them into matrices and casting his own letters. He was a man of enterprise as well as of taste and education. The catalogue of his issues is known to have included at least five hundred and eight examples, of which the most notable is the "Polychronicon." As we have seen, William de Machlinia publishing the first edition of a law book, still quoted in our courts, so Wynkyn de Worde is associated with a school-book of which all scholars and students have at least heard. This is the famous "Lilye's Grammar." There is now no extant copy of the work with the printer's name to it, but a contemporary work of Whittington was repeatedly printed by him. Indeed, most of his books are what we should call educational. Books were then printed for scholars, not for the circulating library, and De Worde's catalogue is largely made of "Accidences," "Lucidaries," "Orchards of Words" and "Promptuaries for Little Children."

The men of letters in those days were the bishops and ecclesiastics, and soon all the great cities set up their printing-offices and published their issues. But it is notable how the master-printer was generally a foreigner. One of the most eminent of them was Peter de Triers, a native of the town now generally known as Treves, who started his office at the south side of the Thames, where he published Latin works of Cato and Erasmus. From this time presses began to be freely set up. The universities—Canterbury, Norwich, Tavistock—became great centers of this kind of trade, and it is recorded that in 1538, when Cardinal Wolsey visited his native town, he commemorated the visit by establishing a printing-office at Ipswich.

Scotland soon followed in the wake of England, and Ireland came last. Ireland was in fact the last European country—unless we call Russia a European country in the sixteenth century—which received the art of printing. A volume of the Book of Common Prayer, printed in Dublin so late as 1551, is the first Irish book, and this was followed by a liturgy for the use of the Scotch Highlanders printed in the Irish character. The interest of these publications has been chiefly their antiquity. They are curious and archæological. Clearness and beauty of type came afterwards. In that department our printers have certainly been surpassed by foreigners—Aldus, Elzevir, and even Didot being superior. One of our greatest names is John Baskerville, whose publications are still occasionally to be picked up cheap on the London bookstalls. He was no tradesman in his craft, but spared neither pains or money to make his work worthy of his name. Printing with him was in fact what Walter Shandy would have called his hobby-horse. He is said to have spent $3,000 before he could get a single letter which came up to his own standard of excellence, and he had invested thousands in the business before he could make it pay. In fact, with him it was not a business, but an art. He did not adopt it to make, but to spend money already made. His issues have very much the same kind of excellence as, compared with contemporary and subsequent prints, that Josiah Wedgwood's platos and vases have with reference to their modern rivals. He saw to everything himself. He manufactured his own printing-ink, presses and molds. Though he was a wealthy man he was not ashamed of the trade which he had adopted. In fact, it was not a trade for him, but an occupation. On the panels of his carriage he had caused to be painted a series of the different processes in printing. His chief excellence was in the construction of his Italic letters. They are thought by judges to stand unrivaled for freedom and symmetry. Many of his books were printed from silver types, and thus gained a delicacy which makes the paper appear almost like vellum. We shall scarcely again have such a printer. The man was an eccentric; found his reward, not in what he made by his books, but in what he made them. He died at the beginning of this century, and ordered that he should be buried in his own garden, and his dying wish was respected. Since his day science has been busy in invention and its application to art, but his work holds its place still. We have had greater printers, but we have scarcely had better-printed books.

THE PHOSPHORESCENCE OF THE SEA.

The Noctilucæ are little crystal balls of about the size of a pin's head. The transparence of their structure permits an easy investigation. Not a fiber is to be seen, unless, with De Blainvil, we consider the transverse markings of the tail in the light of muscular fibers, a supposition which is very questionable. In the neighborhood of this tail there is usually a mass of food or the indigestible remains of food. Not that we are to look for a stomach in this animal,—nothing of the kind exists; but in lieu thereof we find, as in Infusoria, a number of vacuolæ, or assimilating cavities, which appear and disappear, according to need, formed out of the contractile substance which is seen radiating in filaments all through the substance of the animal. In this curious animal, not a trace has been discovered of vessels, nerves, senses, or indeed of any "organs" whatever. It is a mass of animated jelly, with a mobile tail. Its mode of reproduction has been variously expounded, but the generally received theory is that they multiply by spontaneous sub-division. No one has yet observed anything like reproduction by means of ova.

To these Noctilucæ the sea owes much of that brilliant phosphorescence which at all times has been the marvel of travelers. Place your vase in a darkened room, and strike the glass, or agitate the water, and you will be delighted with the spectacle presented. From every part brilliant sparks appear and disappear, until at length no agitation of the water will produce more; their power is exhausted, as that of the electric eel is exhausted, after a few shocks. You want to know the cause of this phosphorescence? Unhappily the point is still in doubt. It is only since the beginning of this century that the attention of naturalists has been fixed upon the Noctilucæ as sources of the phosphorescence, in all times observed, and in former times attributed to the presence of decaying organic substance, to electricity, to an absorption of solar light disengaged in the dark.

There are two different kinds of phosphorescence observed in the sea. The first is of very brilliant but isolated sparks, and is due principally to Starfishes, Crustaceans, and Annelids. The second is of a general luminous tint, over which are strewed isolated sparks, and is due to the Noctilucæ. These Noctilucæ have no special organ which produces the phosphorescence as the other animals have; but the light emanates from the whole substance of their bodies. Every irritant, no matter of what nature, produces this phosphorescence in them. The phenomenon is not, as insects, one of combustion; but is intimately connected with the contraction, spontaneous or provoked, of their substance. It is independent of all secretion, and it is probable that the sparks are due to the rupture and sudden contraction of their sarcodic filaments; while the steady light they emit in dying, results from the permanent contraction of this sarcodic substance. L.

PADDLING ON A HOT DAY.

BUSY BRAINS.

This morning at ten o'clock, the mercury in the thermometer stood at ninety degrees in the shade. What it would reach before night was fearful to contemplate. The children, accustomed to out-of-door sports, were showing symptoms of restlessness, the boy was getting decidedly cross, lying on the lounge growling at the weather, teasing his sisters and making himself generally disagreeable, when one dear little philosopher unconsciously came to the rescue. Having gathered in my flock I was busy shutting up the house to keep as cool as possible. "Mamma, what shall we do to forget that it's hot?" said the little one. Kitty had just brought up a dish-pan of ice-cold water, the drippings from the refrigerator.

"Stop Kitty, do not throw that out. Now, children dip your hands in, way in. Does not that feel good? Floy seat the baby on the table and let her have a share."

The little pearly teeth gleamed out in merry laughter as the dimpled arms, up to the elbows, were immersed in the deliciously cool water and in less time than it takes to write it, my kitchen table was surrounded by a pleased, chattering group. All thoughts of the weather were forgotten in the novel delights of "paddling." Even mamma had to take a dip, and I did not wonder at the sudden change of countenances when I experienced the delicious coolness slowly creeping up my arms and imparting its cooling influence over my whole body. "Children, let us wipe our hands and undress ourselves. The little ones can put on only a slip and the older ones a gown and you can play that you are Indians to-day, for there will be no company."

The undressing was expeditiously performed and the troop that filed past me a few moments after was certainly a good-natured one. But I had more noise and company than I had calculated on, for the suggestion of Indians not only led to surprising embellishment but most hideous were the dances and whoops which followed as a natural consequence, and the little neighbors opposite, hearing the fun and catching a glimpse of bare legs (for now and then one of the tribe would make a raid upon a harvest apple-tree which stood near the house), could not resist the fascination and tripped over bare-legged to join the happy band of savages.

At four o'clock, as a slight shower had tempered the extreme heat, I had a tub brought into the kitchen and the little ones were allowed to splash in a little while before being dressed, the older ones running up to their rooms to resume their civilized dress, all declaring this had been a jolly day. So has passed our hottest day this summer. Idly, perhaps, but happily and not altogether unprofitably since we learned that troubles are, after all, pretty much as we take them, and that even a hot day can be made not only bearable but pleasant. We had no fire in the kitchen and made our dinner of cold roast-beef, bread and butter, blackberries and cream, and I am sure that Kitty welcomed the omission although she at first demurred about putting off "jist the tail end of the iron!"

Watching one's-self.—"When I was a boy," said an old man, "we had a schoolmaster who had an odd way of catching idle boys. One day he called out to us:

"'Boys, I must have closer attention to your books. The first one that sees another idle, I want him to inform me, and I will attend to the case.'

"Ah!" thought I to myself, there is "Joe Simmons that I don't like. I'll watch him, and if I see him look off his book, I'll tell." It was not long before I saw Joe look off his book, and immediately I informed the master.

"Indeed!" said he; "how do you know he was idle?"

"I saw him" I said.

"You did? and were your eyes on your book when you saw him?"

I was caught, and never watched for idle boys again.

If we are sufficiently watchful over our own conduct, we shall have no time to find fault with the conduct of others.

Sabbath Reading.

LIFE'S WEST WINDOW.

We stand at life's west windows,
And think of the days that are gone;
Remembering the coming sunset,
We too must remember the morn;
But the sun will set, the day will close,
And an end will come to all our woes.

As we watch from the western casements,
Reviewing our happy youth,
We mourn for its vanished promise
Of honor, ambition, and truth;
But hopes will fall and pride decay,
When we think how soon we must away.

We stand at life's west windows,
And turn not sadly away,
To watch our children's faces
The noontide of sparkling day;
But our sun must set, our lips grow dumb,
And to look from our windows our children come.

Still looking from life's west windows;
And we know we would not again
Look forth the eastern lattice,
And live over all life's pain;
Though life's sunlight be brilliant, its sunset is sweet,
Since it brings longed-for rest to our weary feet.

[*Household.*

THE FIRST PROPHECY.

"And I will put enmity between thee and the woman, and between thy seed and her seed; it shall bruise thy head, and thou shalt bruise his heel." Genesis iii. 15.

Such is the first prophecy which occurs in Scripture. Adam and Eve had transgressed the simple command of their Maker; they had hearkened to the suggestions of the tempter, and eaten the forbidden fruit. Summoned into the presence of God, each of the three parties is successively addressed; but the serpent, as having originated evil, receives first his sentence.

We have, of course, no power of ascertaining the external change which the curse brought upon the serpent. The terms, however, of the sentence, "Upon thy belly shalt thou go, and dust shalt thou eat all the days of thy life," (Gen. iii. 14), seem to imply that the serpent had not been created a reptile, but became classed with creeping things, as a consequence of the curse. It is probable that heretofore the serpent had been remarkable for beauty and splendor, and that on this account the tempter chose it as the vehicle of his approaches. Eve, in all likelihood, was attracted towards the creature by its loveliness; and when she found it endowed, like herself, with the power of speech, she possibly concluded that it had itself eaten of the fruit, and acquired thereby a gift which she thought confined to herself and husband.

But we may be sure that, although, to mark his hatred of sin, God pronounced a curse on the serpent, it was against the devil, who had actuated the serpent, that the curse was chiefly directed. It may be said that the serpent itself must have been innocent in the matter, and that the curse should have fallen on none but the tempter. But you are to remember that the serpent suffered not alone: every living thing had share in the consequences of disobedience. And although the effect of man's apostasy on the serpent may have been more signal and marked than on other creatures, we have no right to conclude that there was entailed so much greater suffering on this reptile as to distinguish it in misery from the rest of the animal creation.

But undoubtedly it was the devil, more emphatically than the serpent, that God cursed for the seduction of man. The words, indeed, of our text have a primary application to the serpent. It is most strictly true, that, ever since the fall, there has been enmity between man and the serpent. Every man will instinctively recoil at the sight of a serpent. We have a natural and unconquerable aversion to this tribe of living things, which we feel not in respect to others, even fiercer and more noxious. Men, if they find a serpent, will always strive to destroy it, bruising the head in which the poison lies; whilst the serpent will often avenge itself, wounding its assailant, if not mortally, yet so as to make it true that it bruises his heel.

But whilst the words have thus, undoubtedly, a fulfillment in respect of the serpent, we cannot question that their reference is chiefly to the devil. It was the devil, and not the serpent, which had beguiled the woman; and it is only in a very limited sense that it could be said to the serpent, "Because thou hast done this," We are indeed so unacquainted with transactions in the world of spirits, that we cannot pretend to determine what, or whether any, immediate change passed on the condition of Satan and his associates. If the curse upon the serpent took effect upon the devil, it would seem probable, that, ever since the fall, the power of Satan has been specially limited to this earth and its inhabitants. We may gather from the denunciation, "Upon thy belly shalt thou go, and dust shalt thou eat all the days of thy life," that, in place of being allowed, as he might beforetime have been, to range through the universe, machinating against the peace of many orders of intelligence, he was confined to the arena of humanity, and forced to concentrate his energies on the destruction of a solitary race. It would seem altogether possible, that, after his ejectment from heaven, Satan had liberty to traverse the vast area of creation; and that far-off stars and planets were accessible to his wanderings. It is to the full as possible, that, as soon as man apostatized, God confirmed in their allegiance other orders of beings, and shielded them from the assaults of the Evil One by chaining him to the earth on which he had just won a victory. And if, as the result of his having seduced our first parents, Satan were thus sentenced to confinement to this globe, we may readily understand how words, addressed to the serpent, dooming it to trail itself along the ground, had distinct reference to the tempter by whom that serpent had been actuated.

But, whatever be our opinion concerning this part of the curse, there can be no doubt that our text must be explained of the devil, though, as we have shown you, it has a partial fulfillment in respect of the serpent. We must here consider God as speaking to the tempter, and announcing war between Satan and man. We have called the words a prophecy; and, when considered as addressed to the devil, such is properly their designation. But when we remember that they were spoken in the hearing of Adam and Eve, we must regard them also in the light of a promise. And it is well worth remark, that, before God told the woman of her sorrow and her trouble, and before he told the man of the thorn, and the thistle, and the dust to which he should return, he caused them to hear words which must have inspired them with hope. Vanquished they were; and they might have thought that, with an undisputed supremacy, he who had prevailed to their overthrow would ever after hold them in vassalage. Must it not then have been cheering to them, whilst they stood as criminals before their God, expecting the sentence which disobedience had provoked, to hear that their conqueror should not enjoy unassaulted his conquest, but that there were yet undeveloped arrangements which would insure to humanity final mastery over the oppressor? And though, when God turned and spake to themselves, he gave no word of encouragement, but dwelt only on the toil and the death which they had wrought into their portion, still the prophecy to which they had listened must have sunk into their hearts as a promise; and when, with lingering steps, and the first tears ever wept, they departed from the glorious precincts of Eden, we may believe that one sustained the other by whispering the words, "Though thou shalt bruise his heel, it shall bruise thy head." H. M.

ST. JOHN AND THE PARTRIDGE.

Dean Stanley tells the children a tradition of St. John the Evangelist, in a very charming way. The Dean must certainly be a good talker to children.

It was whilst St. John was residing at Ephesus that various stories were told of him which we do not find in the Bible. We cannot be certain that these stories are quite correct, therefore, but they accord with all that was known of St. John, and they agree with the letters and epistles which he wrote at that time. One of these stories is:

There came one day to Ephesus a sportsman, who had heard so much of this wise old man that he went out of his way to see him, and his surprise was great when he found St. John engaged in gently stroking a partridge which he held in his hand.

The sportsman could not help saying how surprised he was to see so great a man employed on anything so small. Then St. John said, "What have you in your hand?"

"A bow," replied the sportsman.

St. John asked, "Why is it not bent?"

The sportsman replied, "Because, if always bent, it would lose its strength."

"That is just the reason," said St. John "why I play with the partridge. It is that my mind may be kept strong by not being always at work."

What do we learn from this story, my dear children? We learn from it that St. John, and great and good men like him, are glad now and then to see you at play, and to play with you. We learn that kindness to dumb animals is a thing that God expects of us.

There was an aged lady, very excellent, wise, and wonderfully learned, who lived to be nearly as old as St. John was when he died; she was the famous Mary Somerville, who died last year, in her ninety-second year. A very short time before her death she said, "I hope that the time may come when children shall be taught that mercy to birds and beasts is part of religion!"

Yes, it ought to be a part of our religion, and I trust that we shall make it so. Play, too, with your companions like St. John, remembering that all play and all holidays are given by God, like the unbending of the bow in the story, to help people to work better for the future.

When we consider that sin has slain our Lord Jesus Christ, O how should the thought provoke our hearts to be revenged on sin, for having murdered the Lord of Glory, and done more mischief than all the devils in hell could have done.

PERSONAL ITEMS.

A malicious paragrapher says Stanley Matthews will not sleep alone in a room with an inkstand in it.

Miss Fanny Washington Finch, the great-grand-niece of Washington, and supposed to be his nearest living relative, is keeping a boarding-house at Washington, and has recently had her furniture attached by a landlord for rent.

Matt. Carpenter got $1,000 from the Detroit liquor dealers to study up the constitutionality of the Michigan Liquor Law. He did study up and sent his opinion lately. It was very brief and to this effect, "You can't break the law."

The ex-Empress Eugenia is described by a correspondent at Ems as "sick and sadder than ever." She travels under the name of Countess of Pierrefonds, and has for her suite the Duchess of Mouchy and the Marquis of Piennes. She has some trouble with her legs (wicked tongues say it is the gout) and cannot walk without leaning on a heavy cane.

The late Cardinal Franchi was a charming table talker, and after keeping all the table in a roar while upon a visit to Cardinal Manning, scandalized his host by taking out his cigar-case and offering cigars all around. He was not enthusiastic about the conversion of England to Catholicism. "It will not come in our day," he said, "not till we canonize Saint Mammon."

Mrs. Mackay, wife of the Bonanza King, has a sapphire which was once the property of a Russian prince, and it cost her $150,000. It is an inch in diameter. Her pearl necklace cost $100,000, and her coral set cost $18,000. These few articles of jewelry—these trifling aids to woman's vanity—represent the work of 595 men for one whole year at the liberal wages of $1.50 a day each. Madame Mackay comes from California—and so does Kearney, the denouncer of bloated capitalists.

Prince Napoleon had a narrow escape while attending an agricultural exhibition in Sweden. In company with the King he was examining some machinery and had approached close to an engine, which unexpectedly was set in motion, and some parts of the engine caught the clothes of the Prince, who would undoubtedly have been drawn into the wheels if the King had not, with great presence of mind, instantly himself stopped the engine. As it was the Prince had his clothes torn to pieces.

An incident illustrating Gen. Grant's retentiveness of memory is told. Several years ago, when he was President, a letter was received at the White House from an Ohio florist, asking for a certain rare plant, for which the writer had sought in vain far and near. The President's private secretary returned a reply that it was not to be found in this country. Last winter the florist received a package from Europe containing the long-desired plant, "With the compliments of U. S. Grant."

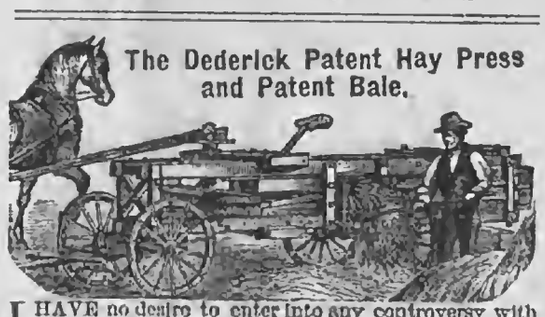
Senator Christiancy is elderly even for his years, neither winsome nor rich, as Senators go, and has many children; and some Washington people think that it was a doubtful rise for his wife when she forsook her brawny young lover and married him, with her dowry of youth and good looks and young love. To her credit it is said that she has not forgotten her old mates in the Bureau of Engraving and Printing. Those with whom she was intimate in her working days still visit her with the old confidence and intimacy.

Lord Acton, according to a curious rumor floating about in English circles, will succeed to the post of principal librarian and secretary of the British Museum. He is a peer of the realm, a liberal Roman Catholic, and connected by birth and marriage with several German and Italian noble families. His uncle was a cardinal; his mother—by her second marriage, the first wife of the present Lord Granville—was the only daughter and heiress of the late Duke of Dalberg, and his grandfather, Sir John Francis Acton, was commander-in-chief and prime minister at Naples. He himself married a daughter of the Bavarian Count Arco-Vallee. The salary is $6,000 a year, but the facilities for literary culture, which the position offers, will doubtless form the chief attraction for his lordship, should the rumor prove correct.

George Eliot (Mrs. Lewes) the greatest living novelist, the thoughtful perusal of one of whose works is a liberal education, has never had a photograph taken, so that the great majority of her admirers are compelled to view her only through pen-and-ink sketches. She is a woman who must have passed her fiftieth year. Her hair is dark brown, and has none of those silver threads one might expect where the burden of half a century of years is added to incessant labor, and experiences full of desolation. She is not at all handsome; her face is long and very pale, with a small sensitive mouth; eyes dreamy, introspective, and sad always. Her hair is worn low over her intellectual forehead, and her slender figure has no robust-energy about it. George Eliot's is the energy of mind, not of physical power. She is one of the greatest living conversationalists. She is one of the most accomplished amateur pianists in England, and a first-rate linguist, and seems to know as much about the healing art, history and philosophy. What the witty Mrs. French said of Madame de Staël—that she is consolingly ugly—applies to George Eliot: but her plain features are made beautiful by her expression. She composes slowly and methodically, not more than sixty lines a day; and report says that when she has completed a book her nervous exhaustion is such that her husband takes her abroad at once to recruit her failing health. While writing, she must be scrupulously arranged as to surroundings and person. She is not only a wonderful author, but a clever housewife, too; and her home-life is perfect in all its details.

Implements and Machinery.

The Dederick Patent Hay Press and Patent Bale.

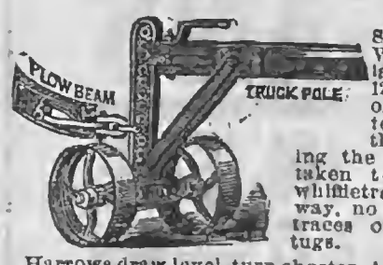


I HAVE no desire to enter into any controversy with a man of the calibre of Mr. Ertel, except through the courts, but to the public I desire to say that he alludes to an article I published, warning all interested of the infringement and use of eight of my patents in the press he advertises, and that I should hold the purchaser liable, all of which I propose to do. I did this to prevent innocent persons becoming parties to a steal, and as both said Ertel and myself now offer to furnish copies of our patents, there is no occasion for further remark, except to request interested parties to send for them, and learn who lies and swindles, and I offer a premium of one of the best Hay Presses in the world to any man I cannot satisfy of the truth of all I assert. I will now state further, and will produce the letters to substantiate, that, at the request of said Ertel, I sent him copies of fifteen of my patents, which he kept about a month, and it was not until after this that he produced his new press, and which his letter, returning my patents, states he meant to try to make, and which should have been an easy thing, seeing that the entire press proper was illustrated and described in those letters patent of mine which he studied about a month. Now, if he will hoist the Communist flag again, appropriate and apply the balance of my improvements on that class of press, in order to do good work, he will then have one of my cheap presses, which I offer at less price than he does the imperfect machine. Of course his applications for patents were rejected on my prior patents, as the records will show, and he was compelled to confine his claims to a few little traps he attached, and which gives him no authority to use my patented press in applying them. I introduced this manner of pressing and bale against the opposition of all others, and have succeeded, to the great benefit of the entire hay interests of the country. I have patented the machine, the bale, and the entire process of making it, and a raid on all by such who opposed it is Communism with a vengeance. My redress is against either the maker, seller or user, as I choose. The user damages me most by the dirty, ragged, contraband bales of my patented form and construction, put upon the market. Judging from the reckless manner he warps the truth in his article, I should say that Ertel's promises of protection to his customers would need some further assurance in regard to his word and ability, even admitting the fact that his customers are few, and his citing me as reference to his responsibility is a mistake, as I have never received any such information on the subject. I notice that he does not deny infringement, which is singular, considering that his entire article is a tissue of falsehoods. I guarantee to furnish presses lower in price and cheaper at price than any other presses as a gift, or no sale. Address for descriptive circular

P. K. DEDERICK,
Albany, N. Y.

IMMENSE SUCCESS.

The HARRIS Farm Truck!



Saves the Gage Wheel, half the labor of holding, 12 to 15 per cent. of the draft, team can back the plow, no riding the beam, plow taken to the field, whiffletrees out of the way, no stepping over traces or letting out tugs.

Harrows draw level, turn shorter, do ¼ more work. Holds Shovel Plow, prevents jumping and dodging. On Scraper saves man and team. Handles never get muddy. Will pay its cost in one week.

Just the thing on Stone Boat, Horse Fork, etc., etc.

Hon. Harris Lewis, Pres. N. Y. D. A., says: "The best farm implement for the money, he ever owned."

Prof. Arnold, Sec. A. D. A., says: "It will be considered an indispensable addition to the list of farm implements when once tried."

Hon. T. F. Randolph, U. S. Sen. from N. J., says: "It is desirable because of its simplicity, effectiveness and economy."

Great inducements to one responsible Canvasser or Agricultural Dealer in each town.

Where no agency is established a Truck will be sent freight prepaid, upon receipt of price. Send for testimonials. Price, Farm Truck, $8; Thills, extra, $3.

New Publications.

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose, WE ISSUE SEMI-ANNUAL EDITIONS OF

AYER & SON'S MANUAL FOR ADVERTISERS. 184 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of 25 cents by N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to All

Wit and Humor.

A LECTURER, addressing a mechanics' institute, contended that "Art could not improve Nature," when one of the audience set the whole assembly in a roar by exclaiming, "How would you look without your wig?"—*Exchange.*

NORTH CAROLINA proposes to introduce the bell-punch for registering votes at elections. Then the popular song will be:

When he receives a vote the inspectare
Will punch in the presence of the electare,
A Dem. check slip for a white votare,
A Rep. check slip for a black niggare,
An Ind. check slip for a bold boltare,
All in the presence of the electare.
—*N. Y. World.*

When a man casually sits down on a large bumble bee's nest, reason urges him to sit there till he has squashed the animation out of the vindictive occupants, but instinct warns him to keep an important engagement elsewhere. This is one of those occasions when instinct invariably gets the better of reason.—*Kansas City Mail.*

A young man made his appearance at Deadwood last week in a pair of white pants. He was promptly escorted to the cars, put on board of them, and an injunction placed upon him never to revisit the place, "We can stand a biled shirt you know," explained a miner, "but when it comes to wearin' biled drawers, we just make them git up and git."

IN an ancient churchyard not far from Stirling the following inscription may be traced on one of the oldest tomb-stones:

"Here lies John Dunn,
He was shot with a gun;
His name was Prime,
But that wouldn't rhyme."

"THANK heaven," said a tormented passenger, "there are no newsboys in heaven." "No," replied the newsboy, "but what comfort do you find in that?" The man didn't say, and everybody else looked pleased.—*Hawkeye.*

MRS. PARTINGTON ON GINGER.—"How flagrant it is," said Mrs. Partington, as she sniffed the odor of a bottle of Jamaica ginger. "It is as pleasant to the oil factories as it is warming to the diagram, and so accelerating to the cistern, that it makes one forget all pain like the oxide gas that people take for the toothache. It should have a place in every home where people are subject to bucolics, and such like melodies; besides a spoonful is so salubrious when run down like a boot at the heel in walking, one feels like a new creature."

REFORMING A TIPPLING HUSBAND.—An enterprising woman in Dundee, who has the misfortune of having a tippling husband, for a long time bore her trial with womanly patience and meekness; from that she passed to gentle remonstrance, but all without avail. Her next step was more decisive. While sitting up lately waiting for the truant, a bright idea sprang up from her nursed wrath, and she resolved to act upon it. Her husband at length appeared, went to bed, and fell asleep. Mrs. Caudle then set to work. She first tied his hands and feet, and then rolling the sheet around him, sewed it tightly with double thread, and in this state left him till morning. Having slept off his debauch, he awoke, but something was the matter, for he could move neither hand nor foot. Looking up, he saw his long-suffering wife bending over him, but not in loving smiles. First reproaching him for bringing "wife and bairns to ruin, drinking there wi' sic a crew," she folded down the bed clothes, all but the sewn sheet, and then laid on the "tawse" with a right good will. Poor Caudle stood it manfully for a while, but at length he pleaded piteously for mercy, and promised faithfully to be a better boy in all time to come. The cure, it is said, is likely to be effectual.

CHILDREN.—Mrs. Smith, mamma wants to know if you would be so good as to sit on this trunk so we can lock it.

Encouragement for the Feeble.

So long as the failing embers of vitality are capable of being rekindled into a warm and genial glow, just so long there is hope for the weak and emaciated invalid. Let him not, therefore, despond, but derive encouragement from this and from the further fact that there is a restorative most potent in renewing the dilapidated powers of a broken-down system. Yes, thanks to its unexampled tonic virtues, Hostetter's Stomach Bitters is daily reviving strength in the bodies and hope in the minds of the feeble and nervous. Appetite, refreshing sleep, the acquisition of flesh and color, are blessings attendant upon the reparative processes which this priceless invigorant speedily initiates and carries to a successful conclusion. Digestion is restored, the blood fertilized and sustenance afforded to each life-sustaining organ by the Bitters, which is inoffensive even to the feminine palate, vegetable in composition and thoroughly safe. Use it, and regain vigor!

The Naturalist.

ANTHROPOID APES.

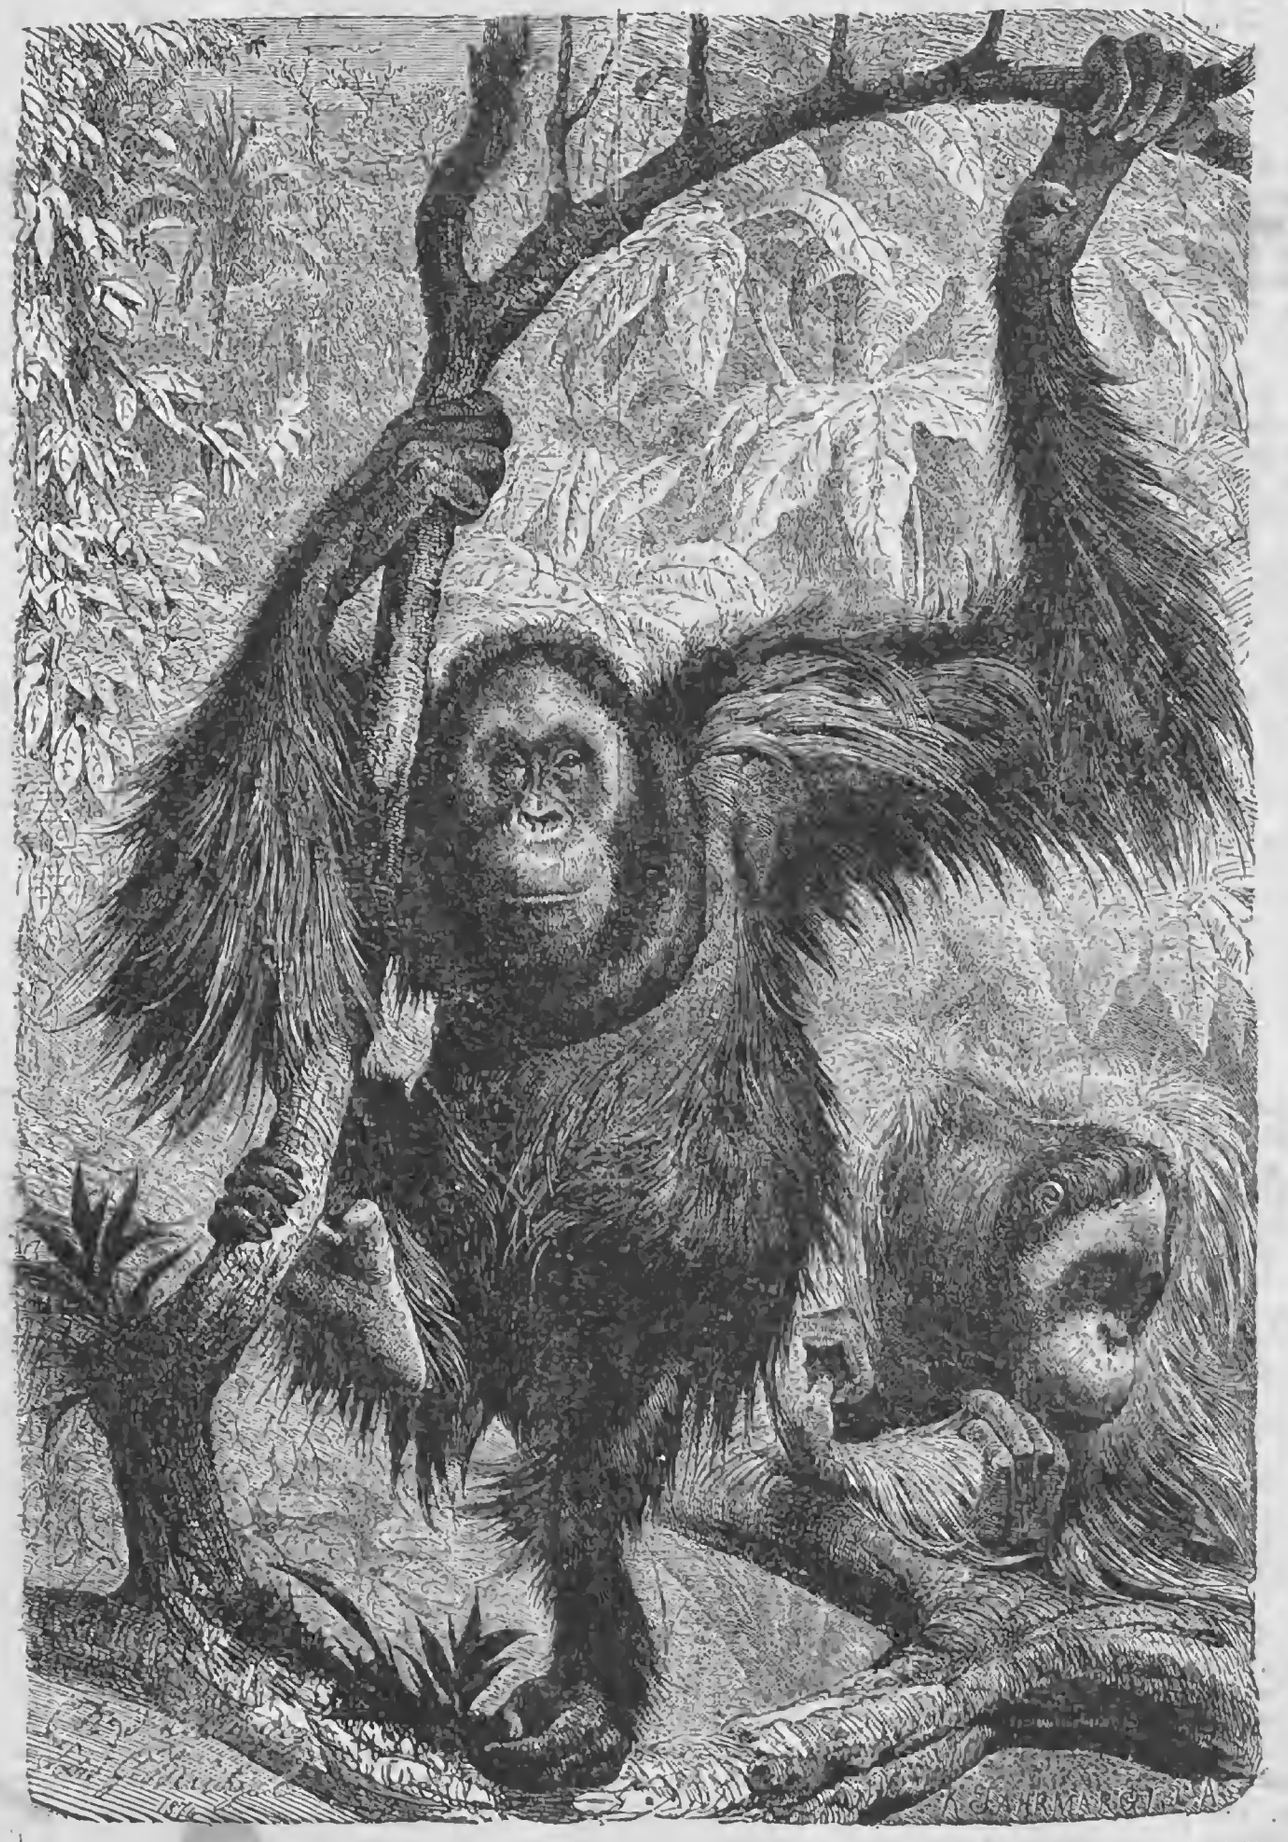
By universal consent the Quadrumana, or four-handed animals, occupy the highest rank in brute creation. It may, however, be questioned whether if Man never existed this place would be assigned them by any observing intelligence. Of the five divisions into which naturalists generally separate the Simiadæ, the apes both by their physical organization and habits, bear the closest resemblance to man. This analogy is so striking in the orang-outang, gorilla, chimpanzee and gibbon—hence called anthropoid apes—that not a few naturalists have concluded they are inferior varieties of the human race, while others maintain that man is either descended from the ape or that both have sprung from some common ancestor now extinct, and that the present differences between them are due to minute differentiations continued in divergent lines through countless ages. As yet, however, most naturalists are of the opinion of humanity at large, and, disdaining to acknowledge any connection between themselves and these grotesque or hideous caricatures of them, attribute the numerous points of resemblance to the fact that, in the vast multitude of different existing animals, a great number of close analogies may arise without the necessity for any consequent relationship between the groups in which they are manifested.

It must be owned, however, that the natural repugnance man feels for so degraded a counterpart, is not the least of the causes of this opinion; for in all other cases, a close resemblance between different animals is certainly suggestive of their relationship, and to the strictly scientific mind, which eschews prejudice, the inferences from the resemblance of the monkey to man, form no exception to this rule. Hence the illustrious Linnæus placed both in his Order of Primates, or first animals, and composed his genus Homo, Man, not only of humans, homo sapiens; but also of Chimpanzees, homo troglodytes; of gibbons, homo lar; and of orang-outangs, homo satyrus. And down to-day the Linnean name "Primates" has been retained for the ape order, not only by some of the foremost naturalists who, like Huxley, believe man should be retained in it; but also by many other scientists who, like Geoffroy St. Hilaire, believe that he should be excluded from it. It is to Cuvier that we owe the term Quadrumana, or four-handed, as applied to the order of monkeys in contradistinction to Bimana, or two-handed, bestowed on an order of which Man is the only representative.

Those among us who jocularly or scientifically claim a relationship of some sort with the monkey race, as well as those who lightly or indignantly repudiate all kinship of the kind, have both defensible grounds for their respective utterances. In favor of the former it cannot be denied that, from a purely anatomical point of view, the points of similitude between the man and the monkey are too many and close to be easily attributed to accident. The skeleton of anthropoid apes generally, consists of but few more bones than that of man. The proportions of its parts, if we except the relative length of the limb bones, are also much as in man, nor are their shapes, except as regards the jaws and haunch bones, greatly different. The same general resemblance likewise holds true of their minute structure, though the osseous tissue in the ape is generally denser than in the human, and the cavity for the marrow in the long bones, smaller.

On descending from generalities to particulars, however, the resemblance is less complete and the structure of the monkey shows a decided inferiority precisely in those organs which assure the superiority of the human being over the rest of creation. To the ordinary reader a detailed enumeration of the points of structural difference would be wearisome from its length and, without constant reference to a dictionary, incomprehensible from its technicality. To afford our readers, therefore, an intelligible idea of the relative appearance and formation of man and ape, it has been thought best to present to them, in this connection, carefully drawn illustrations of a human skeleton and of that of an orang-outang, one of the brutes whose structure bears the closest analogy to that of sovereign man. A careful comparison of the two will be equally interesting and instructive and obviate the necessity of more than a few explanatory remarks.

The absolute size of the brain never in any ape approaches that of the lowest type of rational human beings. Thus the cranial capacity is never less than 55 cubic inches in the latter, while in the ourang and chimpanzee it is but 26 and 27½ cubic inches respectively. In general form and structure, however, the brains of man and monkey closely resemble each other, though that of the latter is considerably less convoluted. With this exception, and its great inferiority in size, the brain of the orang is a counterpart of man's in all respects. In man the orifice through which the spinal marrow connects with the brain, is so situated as to render the head easily balanced; whereas in all monkeys it is so far back, that there is a constant tendency of the head to hang forwards—one of the structural causes which renders it a matter of great difficulty for all monkeys to move freely in an upright posture. The teeth of apes consist, as in man, of incisors, canines, premolars and molars, and generally the higher apes have the same number; but no ape has the teeth placed in an uninterrupted row in each jaw, and from the prolongation of the canines into opposite interspaces, they soon grow into tushes.



ORANG-OUTANG.

The comparative intelligence of different kinds of men is not uncommonly inferred from the relative size of the facial angle formed at the junction of two straight lines, one drawn from the middle of the exterior entrance of the ear to the base of the nose, and the other from the prominent center of the forehead to the most prominent part of the upper jaw. The more open this angle, the higher the estimation of the intelligence of the subject. Judged by this rule, the intelligence of the brightest species of monkeys, is far behind that of the lowest race of humanity. In the skulls of nearly every class of the former, the face slopes backward, so that this angle is always more or less acute, its size diminishing with the age of the animal; for in all the apes there is a gradual impairment of the faculties, and a gradual increase of all vicious qualities as they advance in years—phenomena that correspond with a growing depression in the anterior portion of the brain, an elongation of the face and a considerable diminution of the facial angle. However submissive and obedient in early life, a monkey invariably becomes malicious, quarrelsome, and unmistakably brutish in old age.

The monkey's larynx greatly resembles that of man, and his tongue is only a trifle longer, yet the power of speech is utterly denied to all the species, though it is not improbable that, like most other animals, they possess the faculty of communicating facts, to a limited extent, to each other. The neck of all apes is much shorter than that of the most apoplectic mortal, while in some cases the head rests almost directly on the shoulders. While the anterior limbs, or arms, though varying considerably in length, are always much longer in proportion to the trunk, than in the case of man, the posterior limbs, or legs of apes, are shorter, and generally proportionately weaker than those in the human body. It has been well said that human civilization is mainly due to the conformation of human hands and feet, and especially to the position of the thumb fronting the four other fingers. The shape of the foot enables man to stand firmly in an upright position, and after the lessons of childhood, to balance himself unconsciously, while moving about. On the other hand, the monkey's feet turn inwards, so as to enable him to grasp more easily and firmly, the branches of the trees among which he naturally lives; while it is only by great efforts he can walk erect on the ground. Though his hands have five fingers, the thumb is short and widely separated from the other fingers, and, moreover, the latter are mutually dependent and cannot act separately like the admirable instrument which has enabled man to accomplish so many marvels of industry and art.

The Orang-outang is a native of Sumatra and Borneo. He is from four to five feet high, tailless, like the other anthropoid apes, and intellectually generally is considered superior to all the monkey race. The adult male Gorilla is from five to six feet high and from seven to nine feet from the end of one outstretched hand to that of the other. He is an inhabitant of the equatorial regions of Western Africa, the same country which furnishes the Chimpanzee, which of all the race approaches nearest to man in its whole configuration. He is of about the same hight as the orang-outang, and his skull is represented at fig. c.—p. 599 The Gibbon is generally considered the connecting link between the ape and the baboon, rarely exceeds four feet in hight; is extremely active among the branches of trees, is an inhabitant of Siam and Malacca, and has a head shaped as at b. His arms reach the ground and when extended are twice the length of the body.

Farm Topics.

HINTS FOR THE SEASON.

EACH month and each week bring their own work. To the farmer there is no time for idling. Instead of allowing work to crowd, he always does what he can in advance, that he may be ready for bad weather, company, sickness or a holiday.

LUMPY GROUND.—One of the best things to do for lumps is to tile the land. Instead of spending so much time on the surface, begin at the foundation. It has always been found to pay to tile heavy land, especially if the soil was strong. Clods may be crushed by rolling and scraping and harrowing, but for the best results in seeding to wheat or any other crop, it is not best to crush all the lumps on the surface. After a rain, such soil will pack and bake hard if left too fine on top. Harrow thoroughly and pulverize below the surface and leave small lumps on the surface. Put in some furrows for surface drainage, running them obliquely down the hillsides to prevent washing by rapid currents.

LIVE STOCK.—Animals must not be without a liberal supply of good water. They will suffer for want of it, and will not thrive so well. Arrange for pasture in abundance for late feeding. Sow some rye for pasture late in autumn and early spring, when the ground may be plowed for other crops. Look especially after the poor animals. Those which are poor in autumn should be disposed of in some way. Feed them up, sell them, or knock them on the head. It is better to kill them now than to care for, and watch them with anxiety for the next six months, and then have them wither up and die. At this season of the year, an experienced eye will usually pick out most of the sheep which are not worth wintering. It is too late in the year to begin to feed up poor animals, and do it most profitably.

ROADS.—The easiest way to keep them in good repair is by frequent scraping. This fills all little holes, keeps the water off the surface and allows the travel to pack the ground hard. A quarter or more of the road-tax of any district should be used in buying a scraper, and in using it just at the right time. The best time for scraping is soon after a rain has nearly dried off. Every neighborhood which has never tried this method will be surprised to see how far a little work will go. Once tried they will not abandon the plan for any other.

FAIRS.—Attend the fairs, and not only attend, but help support them by taking something from your own farm. People cannot all be spectators on such occasions. Those who are most active in the support of fairs do the most good and are themselves the most benefited. They learn more by taking part than they would by merely looking on. Take a note-book and pencil and fill it with addresses of men you wish to visit or write to; also get numerous new and valuable ideas for future use on the farm, or the Grange, or Farmer's Club, or at a future fair. No farmer in these times can afford to stay away from the fair.

WEEDS.—True to their nature, all weeds are now hurrying on to produce flowers and seeds. It is astonishing with what rapidity they will mature at this time of year. It is their last chance—now or never. As soon as the crops are off in the garden, the land should be sown to some other crop, or cultivated every week so as to prevent weeds from maturing.

SAVING SEEDS.—Save a good supply of all sorts of good seeds of grain, vegetables, and flowers. It may cost more than to buy them, but even if it seems to cost five times as much as to buy of the seedsmen, it will pay to raise your own seed. There are many poor seeds in the market. Label them properly as collected, with the name, date, and peculiarities. Have a place where they may be well dried, and then put them away free from vermin.

PICK APPLES rather early if they are expected to keep well. Place them in barrels or in heaps under the tree, or in a shed, where they should remain till cold weather in November or December, when the cellar will have cooled off ready for fruit. Attend to assorting properly. If you have never attended to it, try this as an experiment. The same fruit, good and poor, will bring much more money when put up in separate packages. While picking, do not forget to search for a few of the finest of each variety to show at a winter meeting of your Pomological Society, your Club or Grange.

CELERY should be kept growing and hilled up for blanching. In treating this delicious vegetable, remember that it likes a liberal allowance of water. Plant on damp soil or irrigate occasionally.

BEETS should be topped and buried before a hard frost. Dig trenches in a dry place a foot and a-half wide, and place the beets in below the surface, cover them gradually. For daily use, keep beets and all vegetables which are liable to wilt, in a box of damp sphagnum, in the cellar.

SQUASHES should not be out in a frost. Cut the stems from the vines. Handle the squashes with great care and remove them to a shed where they should remain covered with litter till danger of freezing.

CURRANTS AND GOOSEBERRIES.—Now that currant worms and borers are so troublesome, people are likely to neglect or quit raising the fruits named above. Perhaps it may be best to increase the plants and take thorough measures to fight the insect pests. Cuttings should be made now—of young growth, six inches or more in length. Those should be set close together for two-thirds of their length in the soil in a sheltered place. By spring they will be nicely callused and most of them rooted.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE observe that the escutcheon theory has assumed the importance in Pennsylvania of a government commission. This was the case in France years ago, and they reported in favor of the Guenon system, which gave it a prominence which no doubt will be renewed by the gentlemen in Pennsylvania who are now guessing how many quarts of milk cows will give. According to the report of their investigations thus far, they have come pretty close to the statements made by the owners of the cows. Guenon wrote a book about the escutcheon, and claimed to be able to tell almost exactly how much milk a cow would give from the width of the upright hair belt behind and the shape and form of the curls alongside. A big, broad belt means, according to his theory, a big pail of milk. We bought a cow once just on account of her escutcheon, as it was the broadest and best defined we had ever seen, and four quarts of milk were the most we could squeeze out of her. We are incredulous enough to suspect that if Guenon and the Pennsylvania commissioners, did not look at the udder and milk veins, their escutcheon guesses would not be quite so accurate.

For seventy-five years our cellar has been an unprofitable place in which to make butter. It would get damp and moldy, and the cream would not rise, and the butter would not come. In our day the house has been raised and more windows put in to get more circulation of air. The walls have been cemented, as a last resort, but it was all the same. In despair, the milk in "dog days" was fed to the calves and pigs to get rid of it. Two years ago it occurred to us what was the matter. There was too much circulation. The hot air rushing in was carried against the cold walls and the moisture in it was condensed, and this action going on all day, caused the walls to drip with the accumulated dampness. The windows all having been shut and kept so, there was no more trouble. The cellar is uniformly cool and dry, ranging from 64° to 66°. We can make good, solid, sweet butter all summer, and it comes quickly. Neither milk nor cream breathes, hence there is no need of circulation. Clean the cellar thoroughly out and whitewash it, so that there will be no smells, and keep it shut up tight. It may be aired by opening the windows at night and closing them early in the morning. Mrs. Callaghan had the same difficulty with her cellar, but now, since she keeps it closed, there is no trouble about making excellent butter.

One of our horses had tender feet forward and was very lame. Mr. Van Guysling, who happened to be at the shop while we were getting him shod, advised having shoes put on without calks. "Get the foot as near the ground as possible, so that a horse can step on to nature's calks, the frog," he said, "and the horse will go all right." Old Jim has not been lame since this valuable advice was practically carried out. Another horse had been lame a year, one blacksmith after another had tried his skill, but all in vain. At last a shrewd fellow suggested that the animal had been shod too much. "These artists," he said, "have cut her feet all away." This was not literally true, but each one had pared and cut until the naturally large feet were reduced almost to the quick. By preventing any more cutting away of the feet, this animal was cured.

We are going to sow Clawson wheat on the damp land. This variety does well here, and now since the millers have learned how to grind it right, it makes good bread. On the drier portions of the field rye will be put, as rye does not do well on moist land.

The farmers are all busy now, cutting the weeds and bushes along the highways, as the law in New York State makes it obligatory upon them to do so, on their own lands along the roads.

Saratoga Co., N. Y.

HINTS BY THE ROADSIDE.—No. 1.

I AM very fond of seeking for motes in the eyes of my neighbor farmers; and thinking they cannot see their opportunities as well as an observer, I take this time to make suggestions.

WELL-HOUSES AND RUNNING WATER.

My neighbor Swift has a cool, clear brook running down past his house, fed from never-failing springs and with fall enough to turn a grindstone, do the churning, and, I think, saw up the winter's wood pile. Besides, nothing is more attractive than a running stream neatly cared for and directed into a confined channel of stony bed, and yet neighbor Swift is hiding that stream away in as blind a drain as possible, and does not know the advantage of it for irrigation or for laving his hot forehead on a haying day.

My neighbor Fisher has a spring, never-failing, and of a temperature of 48 degrees all summer, and giving a stream which will fill an inch pipe steadily, and yet there is neither a well-house upon his farm, nor a trout pool, both of which are luxuries to me, which I would not dispense with for half my farm.

LARGE AND SMALL FARMS.

My neighbor Wing has six hundred acres of land and ten laborers. Hay is worth from seven to nine dollars a ton when delivered six miles away at a cost of a man and a two-horse team nearly all day. Corn is a paying crop; that is, it would be if he had plenty of manure, but my neighbor, Wing, has a habit of letting the waste and refuse of the farm lie a waste around the buildings, and by the roadside, and wash into a stream passing by, and he has too little manure to keep up the fertility of his fields while he is obliged to sell so much to pay his hired workmen. He keeps a hundred sheep, which is a redeeming feature—although with stone walls for fences, it takes a man and a boy to tend them. They are enriching his hill-tops slowly, but surely.

My neighbor Butler has but sixty acres of land. Ten in woods, ten in swamp pasture, and ten more taken up by buildings, garden, pig pasture and roadway. So he has thirty acres of land which he and his son cultivate, and rotate the crops of oats, corn, potatoes, rye, and grass upon. Now, notwithstanding this small amount of land, it is increasing in capacity to produce each year, and I am satisfied that there is one-fourth more growing upon the same ground this year than grew there five years ago.

Neighbor Butler has time between hay and harvest, to carefully grub up every part of the farm, and has a fine compost heap each year, and his women folks are good-natured, and there is a little something coming in against a rainy day, besides the example of good order and taste, and neatness which the snug little farm affords.

HOUGH HANDEL.

Farm Economy.

COURAGE ON THE FARM, IN THE SWAMP AND PEAT-BED—No. 2.

GEN. WM. H. NOBLE, OF BRIDGEPORT, CONN.

"L'Homme propose, mais Dieu dispose."

IN my first article I claimed that our text, rightly applied to life and luck upon the farm, held out no shelter to the unthrift of blundering cowards, but was a call for courageous thought and deed; that it breathed no timid doubt of God's ample disposition of all essential to man's rightful doing, but pleaded for trust and trial. Among the things upon the farm divinely disposed for our needs and thrift, I claimed the deep, unheeded deposits of decay, stored up for land enrichment in the water-logged lowlands and peat beds. For their development some simple methods detailed, brought the system of such work within the wit of all. In that work I urged deep and large tiled drains, insuring the quick leach out of such lands through a century.

After the crowding crops are garnered there comes a dry time, when wages are down a trifle, and help is plentiful. Then is the season to strike into this work with your might, before the great fall rains come to flood your job, and load your muck with wetness. Having marked out your lines and depths with the simple implements and methods detailed, begin at the spot marked for the outflow of your drain and work up on grade along its stakes. As soon as you have mined well into its deep richness, push not your drain further towards its head till you have carted out and stored up a full year's supply. Pile your toil, time and resources into this work. Over your grass, plow-land, or orchard, dump in heaps or spread, just as suits you. Have no fear of piling on too much even of the raw stuff. If the sun and autumn rains do not drench out any astringency or acids charged against the peat, the winter's frosts and thaws will cure its hurt and powder it to ashes. Keep up this work thoroughly and largely at every stay of the other driving work upon the farm.

Cart into your barn-yard deep layers to be trodden and puddled into its litter and the ordure of your stock. Pile up, a few feet apart, great ridges of its unctious blackness to be composted with fish or flesh, or any material of land enrichment at your command. Make up stout heaps to be seasoned well and powdered by the frosts. With this, when dry and fine, litter your stalls and sties, and put it to absorb fatness from your household wastes. It is the grandest disinfectant of rottenness and decay, animal or vegetable. It takes kindly to, and hoards the offal, garbage, and manurial wastes of great towns and industries, and marks their allied disbursement by grander crops.

Take no heed of the wise saws and say-sos hummed into your ears about the sourness of your muck and peat, about how so-and-so tried it and it brought in sorrel. It is senseless lingo. If sorrel springs up where you dump your peat, it is because, before, your ground was too poor to grow it. All the sourness which such deposits average, will not hurt anything that ought to grow. The alchemy of the soil and elements will take care of all undue acidity. Words are wasted about the manurial value of peat, on half who till the soil. They hug "the dollar of the daddies" till it squeals, but will not see or covet the riches of the peat-bed. The least doubt about its quality or use, disheartens all trial, whereas faith and works in these water-logged areas would soon throughout the North, summon to life in crops, their buried layers of decay.

Two friends of mine mark the wisdom of such work, and the folly of its neglect. They were about equal in property, location, and general intelligence. But one believed in peat, and saw through it a way to bonntoous harvests. The other did not know; had heard people say it did not pay; it was sour, and it was this, and that.

It happened that the latter owned a deep salt-inlet peat-bed. Such are made out of ages of decayed reeds and salt grasses, and the washed-in scum and float of the sea. Out of their rich and compact blackness, the tide has drenched all the acidity. But no assurance that trial and analysis had proved his peat-bed about equal, load for load, to stable manure, started him to multiply thereby his crops. So, with borrowed money, he paid at the livery stable, four miles away, four dollars per cord for their fluffy, littered, fire-fanged manure. The like amount and better value of his peat the most slovenly management would have placed upon his land at one dollar per cord. With sharp skill, it could have been dug and dumped for fifty cents. But such talk to him was thrown away. His cash soon ran out. His land starves. His barns are half-filled. His interest lags. He drifts to ruin. The mortgage will eat up his farm and home. He is sorry now he had not gone West—wants to find some salaried employment. He and his like will never learn that this deep blackness stores God's promise and disposal of repair and thrift to our rock-ribbed and gravelly soil. So he wends his way, murmuring that muffled wail of our text, about God's disposal to veil the unluck of intense blundering.

But his brother farmer took straight into his head, and "inwardly digested," this providence of God in the peat-bed. The vegetable generations there entombed seemed to him awaiting a resurrection to life in the waving crops of hopeful toil. No salt muck, or other peat deposit, blessed his farm; but he soon found and bought one close by. By the simple methods before detailed, he struck his lines and grades, and began to open up his agricultural mine. The very first fall after his purchase, he drained deep and delved into its richness with might and main. With greed and toil and faith untiring, he spread and stored and piled hugely all that his means made possible. The nature of peat in all its phases and placers, the elements of its ash, and its best use in agriculture, he made a study, till it was all an open book.

Now mark the result: His crops were trebled. He is at no loss for manure. When the compost in the farm-yard or great field-pile gives out, raw peat, right out of the deposit or that which has ripened in the heap, is given the crops with generous hand. His pasture lands are green and full of feed. His stock are sleek and lusty. No wail comes from him about God's adverse disposal of events and things. He proposes to do, with his might, what God has disposed him to do. He does it and he thrives. He takes no stock in "Go West, young man,"—longs for no cattle ranch, gold mine or placer, and hankers for no deep rich prairie soil.

Now, the chance to do and dare just what has made my friend thrifty and well-to-do, on his worn-out farm, is present to nearly every New England homestead. Right around me are hundreds of acres of outcast peat swamps, of all sizes and depths. A little engineering tact and cheap appliances will carry you, in dry diggings, to their very depths. If draining through the deep and wide earth walls which enclose some, is costly, sink a shaft-well deep down, and set a high-class wind-mill to pump out the waters on to your plow or meadow land. Until these deep stores of enrichment along our coast and in the low and water-logged lands of the interior, are worked into crops, let's hear no more rural grumbling, about soils and their yields. Till that work is done, New England farming has not played out its chances.

But less hopeless drudgery on the farm and larger crops are not all the blessings waking from that peat-bed. Every shovelful prompted by its study and promise, lifts us nearer that mental wakefulness which the farm so lacks. The gain to its toiler, out of God's placers in the peat-bed, will quicken his slow faith in better methods and better stock. The neighborhood gossip, which visits such doings with a thousand questions and endless talk, is an unmeant bless-

ing. It stirs up and saves farm-life from its eternal sameness and dinginess. It helps it out of deep, old-time ruts, and gives its vision scope. It allies thought and toil in social contacts, out of which flash vigor and brightness.

I would not rob farm life of its rationally conservative, sober second-thoughts; but I would have it more closely leagued with real thinking, and not so case-hardened against new ways and ideas. There is no line of life that has more to hope from these, than his who tills the soil. On the fruition of that hope, not only the future of the farm, but that of the country is staked. Our national well-being rests on the stamina and command of those who man this great underlying industry. No people has yet fallen, no republic will ever fall, where a bright-minded race owns and tills the soil. Brain upon the farm means not only intelligent work, but thought commanding the situation. Knowing and feeling its sovereignty of ownership and its rights, it is armed in their defence.

The problem of our future has more to do with those who own and occupy the land, than how to deal with tramps, with the "dollar of the daddies," or unlimited greenbacks. Just now the iron hands that neither eat nor till, are driving muscle back to till the soil. East and West, the same fate awaits the toilers of the workshop. These must have a re-adjustment of abodes and business. The grand result must be, among the owners and workers on the farm, a re-enforcement of brains, brightened by the contact of human masses in factory life. God grant them the will to tarry on the lands, and own their homes! In this result there lives a hope of better days upon the farm, and a brighter country life.

Field Crops.

NOTES FROM NORTH-WESTERN ILLINOIS.

SPRING WHEAT.

I HEREWITH send the RURAL samples of four varieties of Spring Wheat, viz.:

1. PFIFE (or *Fife*).—An early, reliable, standard hard wheat; it has been cultivated here for many years, and is in much favor with both the farmer and miller.

2 MAMMOTH.—This is also a favorite old-established variety; produces well, but is not quite so early or as hard as the Pfife. The Mammoth and the Pfife mixed, it is claimed, will make better flour than either will, if ground separately.

3. EARLY SHERMAN.—This is an early wheat and promises well, but its cultivation is an experiment with us, as this is the first year it has been grown here. It proved a success last season in Butler county, Iowa, whence the seed was procured for five acres of this wheat.

4. LOST NATION.—This is another new variety here, never having been introduced into this locality until this season. The seed was procured from Franklin county, Iowa. Prior to the late "heated term" this wheat made a fine appearance, but the scorching sun and heavy rains, at a time when the grain was forming and was most tender, caused much of it to blight and injured it generally.

EXPERIMENTS WITH SEEDS FROM THE DEPARTMENT OF AGRICULTURE.

Besides those four varieties, there are some other kinds of spring wheat produced here, but I am unable at present to send samples or a description. I have, within the past six years, distributed among the farmers in this vicinity several varieties of spring wheat sent to me by the Department of Agriculture for experiment, but have failed to succeed in establishing any as a variety superior to those commonly grown here. The fault may not have been in the seed sent, but I have found it very difficult or impossible to get busy, practical farmers to give the special and scientific attention to the cultivation of a few quarts of different kinds of cereals, in order to test which is the best kind.

We have had better success in experimenting with garden seeds sent by the Department of Agriculture, some of which have proved of superior quality. Also, the eight quarts of Silver Chaff winter wheat, sent to me last fall, bid fair to prove a success; and some Tappahannock winter wheat, from second year's trial, is very satisfactory.

AREAS OF SPRING AND WINTER WHEAT.

This is a spring wheat region. Ogle County reports to our Illinois State Board of Agriculture, 40,427 acres in spring wheat, an increase of 9,329 acres over last year's. Only a small amount of winter wheat is grown in this county, as it usually winter-kills, but it has stood the test well the past two seasons, and the area of winter wheat will be largely increased this fall. In the central and southern sections of the State more winter than spring wheat is produced. The State Crop Report for June says: "The area of spring wheat is quite limited as compared with winter wheat; there being 291,912 acres of spring wheat to 2,032,843 acres of winter wheat in the State in 1878." The total acreage of spring wheat in this State, in 1877, was 248,458; and the acreage in 1878 is 291,912, showing an increase of 43,454 acres in favor of the present crop.

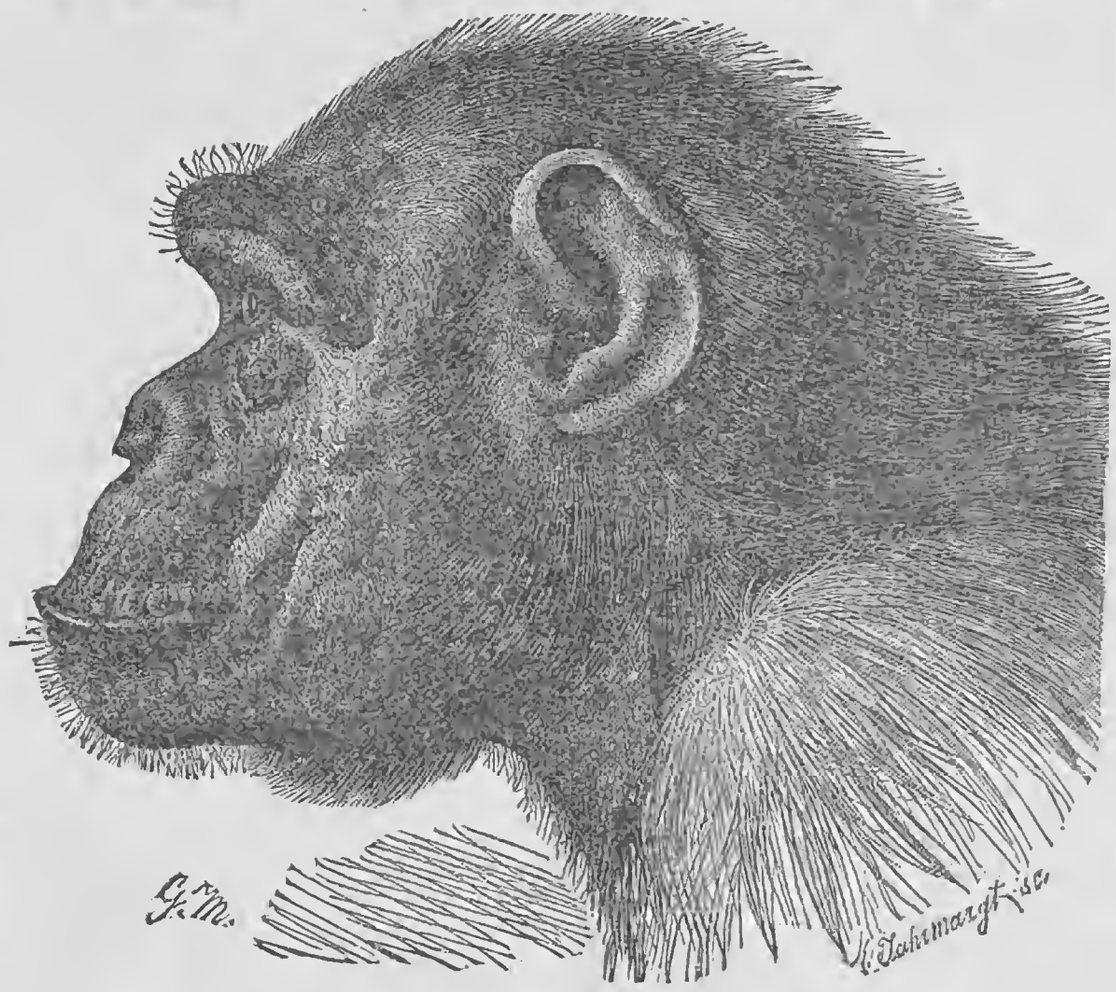
The United States Department of Agriculture in report of June, 1878, says, in regard to spring wheat: "The early opening of spring has given a long season for the sowing of spring grain, resulting in an extraordinary increase in acreage. Returns have been received from the larger portion of the spring wheat area, the result of which may be slightly modified by further data from the area now unreported. So far the comparison stands with last year as follows: Wisconsin, 117; Minnesota, 130; Iowa, 125; Nebraska, 140. The northern borders of Illinois, Missouri and Kansas, which have a small area of spring wheat, also make an increase, Kansas, of one-third; and Missouri, of one-half. This would indicate an increase approximating two million acres of spring wheat. The oldest reporters and earliest settlers of this district state that the past has been the mildest winter and earliest spring known in an experience ranging from 20 to 40 years."

PLANTING SPRING WHEAT.

In order to secure a good crop of spring wheat, the ground should be plowed in the fall and the seeding done as early in the spring as possible—as soon as the frost is out of the ground. The farmers commenced seeding here last spring about the 7th of March, and that which was first sown has proved the best. Two bushels per acre are the usual amount of seed sown. The early part of the season was highly favorable to the growth of this cereal, and the prospect for a large yield was never more favorable until about the middle of July, when there came heavy rain-storms, and the extraordinary "heated term" setting in just before the grain ripened, caused much of it to blight, and will reduce the yield from one-fourth to one-half of what it would otherwise have been. The damage to the crops in certain localities here is great, but it is reported to be still worse further north—in Wisconsin, Northern Iowa and Minnesota, where great losses have been sustained.

It is impossible at the present writing to estimate correctly "what will the harvest be" Winter wheat and rye are very good; oats heavy, but fallen badly; barley less than usual acreage, and colored. No buckwheat here. Corn doing well. Potatoes plenty.

Ogle Co., Ill., July 30, 1878.



HEAD OF GORILLA.

THE SUGAR BEET.

There are many reasons why the sugar beet is one of the most valuable crops the farmer can raise. Until factories are established for making the beet juice into sugar, the crop will need be fed out upon the farm, but in this the return from an acre of beets, is much greater than from any other crop which can be raised for feeding.

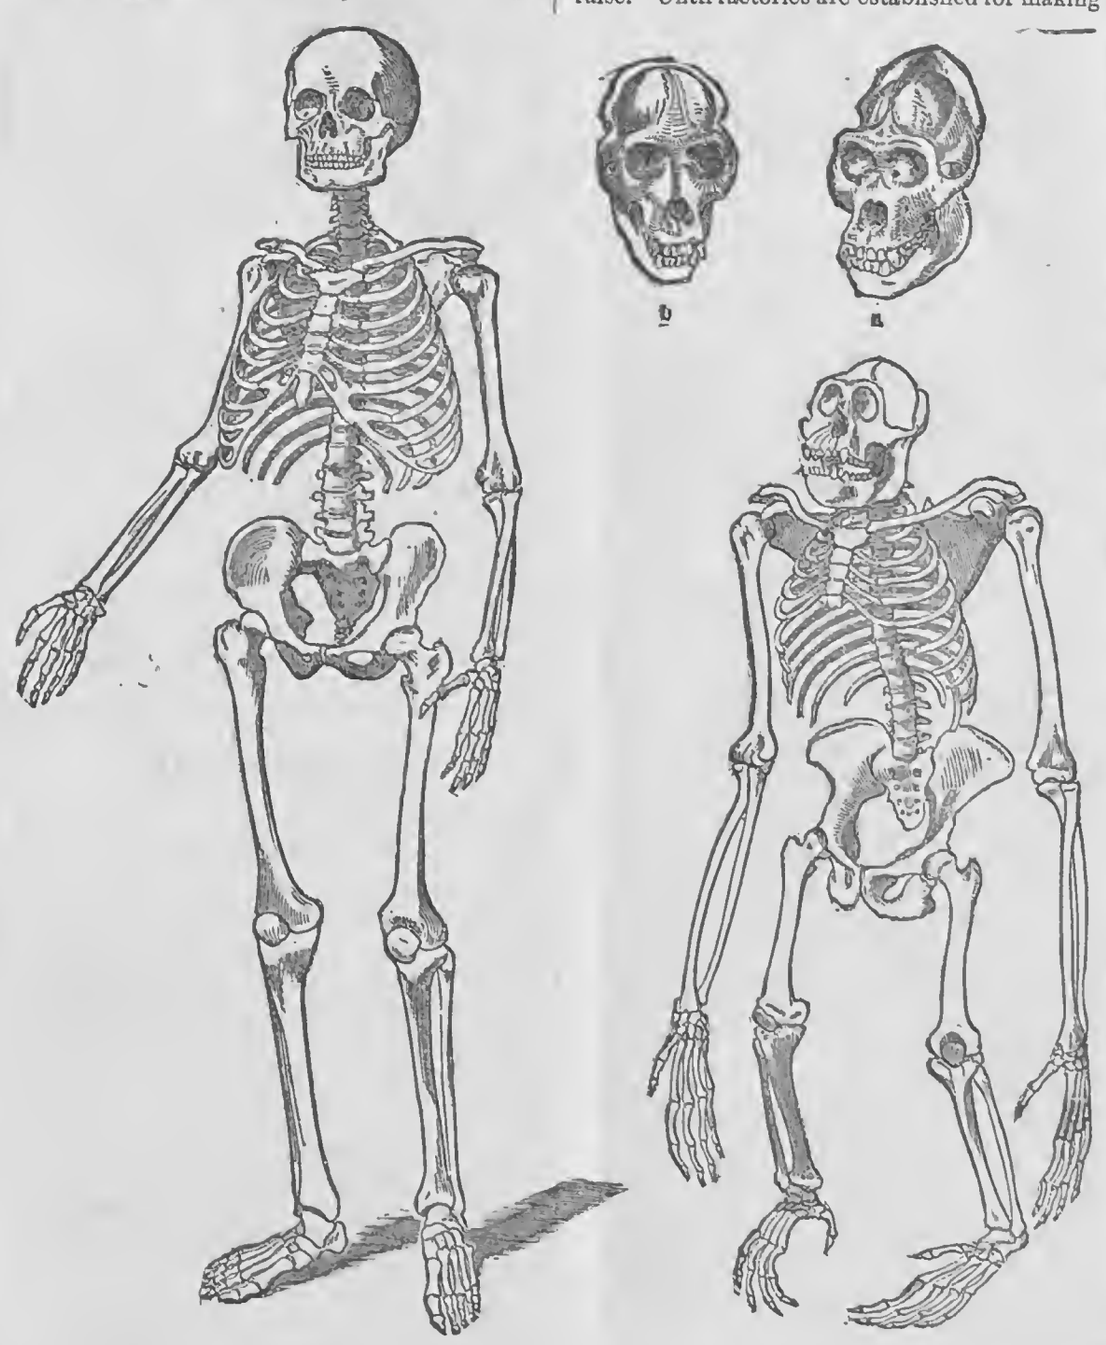
The cost to the farmer for an acre of beets is not a serious consideration, and cannot exceed $15; the planting comes before corn, and the cultivation between that of other crops. No other crop gives as large an amount of easily digestible food for cows, young stock, sheep or hogs, as the sugar beet, while the manure from feeding the beet is of much greater value than when animals are fed upon almost any other kind of roots.

France grows one-half more wheat upon an acre, fattens a much greater number of cattle than the same territory in America, from the fact that that country raises enormous quantities of sugar beets for making sugar, and has the rich manure from the refuse which is fed to the stock.

To have the full value of the raising of sugar beets, we should have the sugar manufactory as well, but until that comes, no more profitable crop can be raised and fed out upon the farm, than beets.

The ground for beets, like that for any other crop, should be mellow, tilled deeply, and rich. The seed should be sowed as early as possible, in rows from two and a-half to three feet apart, so as to allow the use of the cultivator between, and the seed should be sown at the rate of three to four pounds to the acre, and the plants thinned out, and, if need be, transplanted so as to stand from 12 to 15 inches apart; this will give large roots, and a crop of 25 to 35 tons to the acre.

We do not need to go into elaborate discussions of the advantages of this crop to the farmer, or of the beet sugar industry to the nation; the experiment of raising a few square rods of beets is easily made, and when once done, the farmer can satisfy himself as to their value for milch cows, breeding or fattening sheep, and for feeding and fattening swine. The establishment of the beet sugar industry in this country, must come sooner or later.



MAN. ORANG-OUTANG.

Horticultural.

TEACHING BOTANY.

PROFESSOR W. J. BEAL.

BOTANY, in the proper sense, is most intimately connected with floriculture, vegetable gardening, pomology and all departments of agriculture. For some time, year after year, with class after class, I have required my students to study books less and nature more. The results have been gratifying to teacher and pupils. For the encouragement of those who have not tried this method, I may say it is the easier method of the two for the teacher.

The first two weeks were occupied, every day, in the examination and comparison of the small limbs of eight species of trees before any leaves had appeared. Among these were limbs of apple trees and cherry trees. The examination was made during the usual time for preparing lessons *and not in the class-room*. The hour with the teacher was given to a report of the observations of the students, the specimens being out of their sight. In some cases, each student wrote out a careful description of what he had seen. In a similar manner, all other parts of plants were taken up and specimens studied. In nearly all cases they studied the objects before studying the text which referred to or illustrated them. An effort was made to keep them working after something which they had not yet discovered. Quite often members of the class disagreed in their views of the same objects. On the next day they were required to bring in all the proof they could for their belief. This led to interesting discussions. They were rarely ever told, for the first few weeks, anything which they could learn by examining the plants. They were often taught how, and were required to make experiments on growing seeds and plants, such as cutting away one or more cotyledons, the plumule, to see if buds would appear to continue the growth. They marked the radicle by pricking it at equal distances with ink, to see which part of it elongates most rapidly. They cut off buds of trees to induce dormant buds to start; they watched and worked with the tendrils of vines and twining plants to learn how they behaved. They germinated seeds in moss or between damp folds of paper. They studied the behavior of insects on certain flowers. How were they induced to do this extra work? By always making most of this kind of work in the class-room, and by giving them good marks for all such work which was well done. There is generally, though not always, time enough to give each student of the class a chance to put in a word or ask a question on some interesting point.

It is astonishing to notice how much is discovered by so many good eyes, and yet it is sometimes equally surprising to see that some simple, prominent points are overlooked by all.

For some weeks but little use is made of microscopes or text books. In nearly all cases, or in all important cases, specimens were examined and a need was felt for definitions and names before these names were given.

As we progress, a few hints are given, such as the following: It is often of importance to count the parts, to examine several similar specimens of all ages and stages of development

to observe the relative order, to compare the organs of one plant with those of a similar nature found in other species or orders of plants. Gradually the stage microscope was employed, and finally a review is taken, making use of a text book with lectures.

Some may wonder why this finds a place in a Journal of Agriculture. Good habits of observation and study are needed by every man who tends a greenhouse, raises vegetables, fruits or other farm crops. There is no better place for such a beginning than with plants, which are always to be found in abundance. For early forming the habit of experimenting I need not even say a good word. Every farmer knows it is valuable. Patience and accuracy need cultivating. The gardener and farmer deal largely with plants in some form or other from one year's end to the other. The more he studies them, and the better he understands their structure and peculiarities, the more likely will he be to attend to their wants and make them grow successfully.

The members of the class in Horticulture al[so] make experiments, some for their instructi[on] and some of their own account. Some of the[se] made this year were: crossing wheat, crossi[ng] corn, crossing crab-apples, lilacs, strawberri[es] tomatoes, raspberries, gooseberries, apples a[nd] cherries. They experiment on germinati[ng] seeds, layering apples; study the heads of whe[at] as they nod; dig to ascertain the depth to whi[ch] the roots of barley, oats, clover, etc., exten[d] They plant "buggy" peas beside those i[n] buggy for comparison; they dig up stools [of] chess to find the old kernel from which t[he] plants grew. They take a deep interest in t[he] work and they are benefited by it.

Agricultural College, Lansing, Mich.

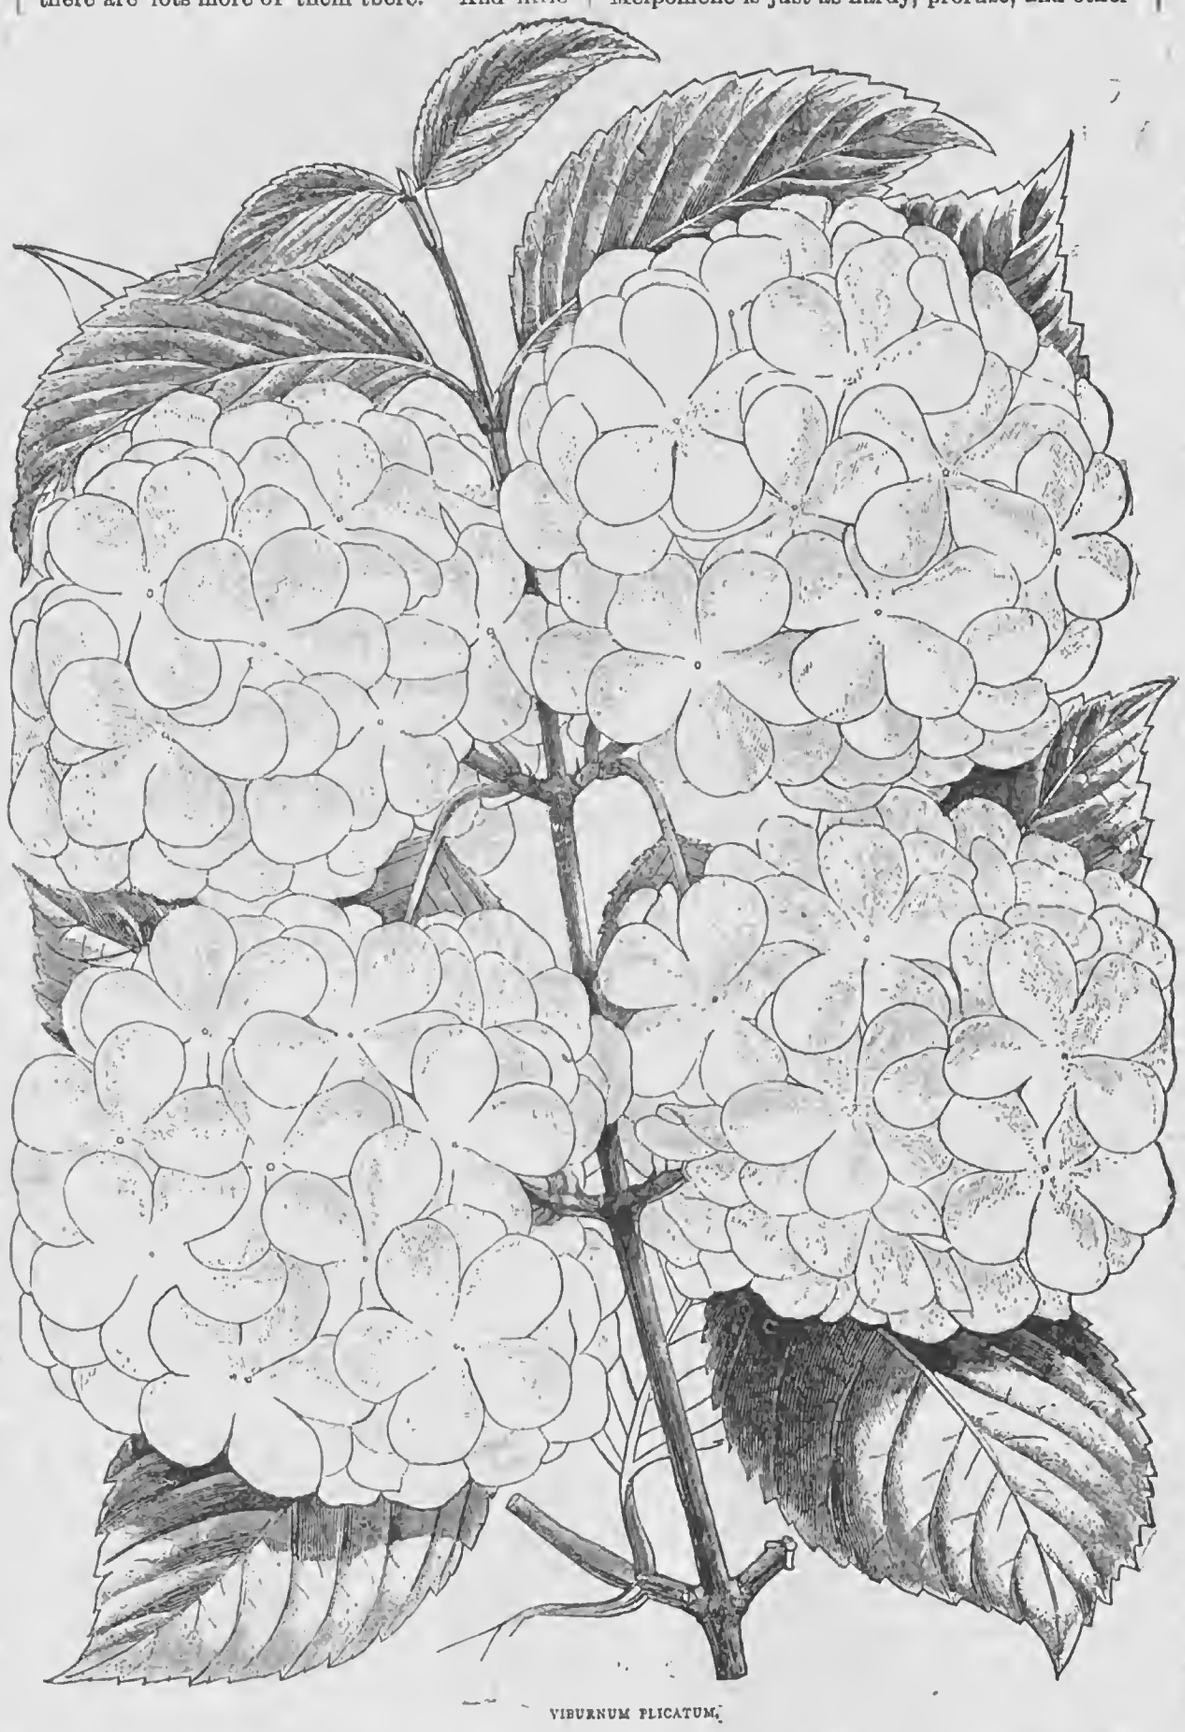
THE JAPANESE SNOWBALL.
VIBURNUM PLICATUM.

In a letter recently written us, we were ask[ed] to name the best flowering shrub. It was a[p]parently a simple question and therefore meri[ted] a simple, direct answer, but as we came t[o] think farther, we hesitated. What kind an[d] number of good qualities should this best shru[b] possess? Unlike the Rhododendron, must the general average of its attractions be of high quality; or, in other words, must it be neither very bad nor yet supremely excellent in any special way? No, not exactly that; and yet, as we pondered the question, we realized that great beauty or great hardiness would not alone make up the best shrub, any more than all excellences could meet in one species or variety. Our friend, therefore, received an answer that embodied the valuable attractions of several shrubs.

In the beginning, it must be confessed, we had intended to declare the Japanese Snowball the very best of flowering shrubs; but, recalling the above train of thought, we have decided that it would not be consistent. We will term it, however, very good, and give proof thereof by a brief statement of its main characteristics.

The Viburnum plicatum is a shrub of medium growth, consolidating its form as it increases in stature. While the leaf and general anatomy of the plant resemble somewhat those of the common Snowball—Viburnum Opulus—the entire shrub is more compact, piling its foliage in masses when properly pruned, and presenting altogether a most picturesque formation. Its special attraction, however, lies in the combined effect of flower and foliage. The flower, or ball of flowers, is as large as that of Opulus, if not larger; but it is more spherical and even in size. The mass of this ball is also more dense and the color of a purer, more milky white. The color may, indeed, be owing to the contrast it affords with the dark green foliage and brown stem. These Snowballs are remarkable for the tenacity with which they cling to the branches for five weeks or more, and even then they drop still undecayed, though some of their freshness has passed away. The foliage makes an equally remarkable feature, its form having suggested the name, plicatum, from its ridged or plaited character. Its texture is firm and tough, and the color a rich, dark, shining green, glossy, but not after the manner of the Laurel or Rhododendron.

The Viburnum plicatum transplants easily, but it does not propagate readily, or rather it is specially inclined to die during the first six months after it is has been planted out from the cutting bench. For this and other reasons, it is scarce as well as choice, few nurserymen offering it in quantities, although it has been introduced over thirty years. This, if nothing else, would account for its being less employed than scores of poorer shrubs. It is too choice and fine individually to be used in masses, but should be planted singly on the lawn, where, by systematic pruning in summer, its peculiar character will be greatly developed. Its origin and history are somewhat obscure. Thurnberg receives credit for having first brought it to Europe, but whether from Japan or Northern China, is not clear. Siebold pictures it well in his great work, Flora Japonica, tab. 38, and it is generally understood to be a well known shrub in Japan. For richness of foliage, both in color and form; for size and even quality, as well as color of flowers, the Viburnum plicatum far surpasses the Viburnum Opulus or Guelder Rose, our common Snowball of gardens. It will thus be seen that when we want a thoroughly good shrub for ornamental purposes, this may be in all respects depended on.



VIBURNUM PLICATUM.

GARDEN TALKS AND WALKS.

The Beeches, Mass., Sept. 9th, 1878.

WILD FLOWERS.

The other day a neighbor lady brought me a bouquet of wild flowers,—"I gathered them in the cow pasture at the back of our house, and there are lots more of them there." And little beauties they were too. Among them were the purple Gerardia (G. purpurea), a little, branchy plant of the Figwort family, and now bearing a profusion of pretty, bright, purple blossoms; the white-flowering form of Turtle-head or Shell-flower (Chelone glabra), which is common in low grounds at this season; and some Ladies' Tresses (Spiranthes cernua), a little orchid, with tall, slender stems, bearing white fragrant flowers.

The gems of spring are long past, the beauties of summer are disappearing, fall is at hand, and still wild flowers are in multiplicity. Golden-rods border every field, meadow and waste place; Marsh Rose-mallows, pink and white, are conspicuous in low grounds, and equally at home in gardens; the deep purple of the Iron-weeds is discernible all around; brilliant Cardinal Flowers glitter in the swamps, with their blue allies as neighbors; the Meadow Beauty is aglow; the handsome white flowers of Grass-of-Parnassus adorn wet banks; White Snake-root inhabits our woods, and Joe-pye-weeds our bogs; Blazing-stars, white and purple, and Partridge-peas, laden with gold, cheer our sandy soils; the white spikes of Burnet rise toweringly over the bushes in damp grounds; the Butterfly-weed or Pleurisy-root is scattered about in dryish places; Asters abound in every direction, and golden composites of many genera brighten the landscape, while Ground-nut, Virgin's-bower and climbing Hempweed run riot over bushes, banks and fences. And all, and hundreds more, are just as applicable for garden use as are the exotics that displaced them there.

A SUPERB GOLD-RAYED LILY.

A single flower stem of the Golden-rayed Lily (Lilium auratum) of Japan, with 140 flowers and flower buds on it, was exhibited by T. P. Symonds, of Salem, at the meeting of the Massachusetts Hort. Society at Boston, on the 24th of last month. It commanded great attention, and, for it, the Society awarded a silver medal to Mr. Symonds. In build it looked like a mammoth hyacinth spike.

LILIUM SPECIOSUM VAR. MELPOMENE.

This is a beautiful, distinct and permanent variety raised by Hovey & Co. of Boston, some twenty years ago. Its flowers are of a deeper rose-color than those of the species or of most of the varieties I have seen; have purple-madder, warty spots, and the flower-leaves are distinctly banded with white. Its leaves are shorter, less acuminate, and more upright in habit, than are those of the typical plant, compared with which Melpomene is just as hardy, profuse, and otherwise satisfactory. Between 1844 and 1860, Mr. C. M. Hovey—one of the most practical and talented horticulturists of the day—raised thousands of seedlings of this fine Japanese Lily (speciosum), and selecting nine of the best and most distinct, he named them after the Muses—Clio, Euterpe, Thalia, Melpomene, Terpsichore, Erato, Polybymnia, Urania and Calliope. All are beautiful, but I like Melpomene far the best. Beyond one or two, the remainder of these seedlings were all classed together and sold as L. s. var rubrum.

Pomological.

MAIDEN'S BLUSH.

This meets with a ready sale on the N. Y. market. It is one of the fairest of apples, having a fresh, red cheek upon a clear, wax-like, pale-yellow ground. It is of medium size, very smooth and even—oblate. The flesh is white, finely grained, tender, sub-acid and it ripens in early autumn, though there is at this time (Sep. 7.) an immense quantity being sold, which indicates an earlier ripening than usual. It is a beautiful fruit to look at and the quality is in keeping with its luscious appearance. The tree is spreading and vigorous and thrives in Michigan, Pa., N. J., Md., Va., O., Ind., Ky., Tenn., Ills., Iowa., Ks.

The Yellows.—In spite of all the legislating and working of our people to check the Yellows in the peach, I am fearful it is gaining in our State. I wonder if in Delaware and New Jersey where they have been harrassed with this disease, they cannot give some light upon its dis-establishment. We seem to know as little about it as about pear blight. G.

Industrial Societies.

FIRST OF THE ANNUAL FAIRS.

A Fine Display marred by bad Weather.

MAGNIFICENT SHOW OF CATTLE.

ALL DEPARTMENTS WELL REPRESENTED.

THE NEW YORK STATE FAIR.

(*Staff Correspondence.*)

Elmira, N. Y., Sept. 13.

This, the last day of the fair, has been a veritable blue day. The rain and wind conspired to make things as uncomfortable as they can be made by the elements. Wednesday was also rainy, and the two together have made a most serious impression on the receipts, and it is probable that the society will have an uncomfortable deficit to make good without the assistance of the gate money that it was hoped the farmers of Chemung would contribute.

It is regrettable that the inclement weather kept many at home, as the thirty-eighth annual fair of the N. Y. State Agricultural Society, in point of interest to farmers, was well worthy their close attention. The entries were very large, but by no means as full as the catalogue promised, while on the other hand, many exhibitors were on the grounds who had no representation in the catalogue, and could not, therefore, compete for the liberal premiums offered.

An unintentional injustice was suffered by quite a number, who had entered in due form, and shipped their goods in what should have been ampletime for them to have reached their destination. Some of these shipments did not arrive until the last day of the fair, and were consequently returned without bulk having been broken.

These delays were due to bad management of the local roads, though the Erie delivered its freight promptly in good shape. The arrangements for transporting passengers to and from the fair, made by the Erie, were ample, well-ordered, and satisfactory. Fifteen-minute trains ran to and from Elmira, during the day, and the crowd was so cleverly managed, that grumblers were as scarce as fine weather. Since its reorganization the Erie has been baptized anew, becoming the N. Y., Lake Erie, & Western. A third rail is being laid, with a view to changing the guage from broad to narrow, (4 feet, 6½ in.) which will increase its connections, its business, and its prosperity. Under its present admirable management, trains and the time-table agree its cars are clean and commodious, and near New York its line is being rapidly and thickly settled by families who find it pleasanter, cheaper, and more convenient, to live "on the Erie" than on Manhattan Island.

Few things besides the weather marred the harmony of the arrangements. The officers of the society, with perhaps one exception, were scrupulously attentive to the wants of exhibitors and visitors. The accommodations for the various classes catalogued were ample, and the incidental expense for material and assistance supplied to those needing it, was reasonable. The awards of the judges in a few instances seemed to display a sad lack of the discriminative faculty, but in the main, their arduous duties were discharged to the satisfaction of those concerned. It is a duty to take note of one instance of the most abandoned cheating on the part of an exhibitor, but as the tricks were discovered, and premiums aggregating one hundred dollars forfeited, I think the fellow sufficiently punished, and forbear disclosing the name. He had entered largely in various classes, but in his grains, seeds, and dried fruits, he practiced such deceptions as filling the bottoms of his barrels with nail kegs, pouring in the grains on top of the same, then exhibiting this specious arrangement as the best *barrel* of beans, for instance, to the prejudice of his competitors who pitted honest measure against these shams. In dried fruits the deception was even more glaring, as the prime fruit was merely a thin layer, which served as a top-dressing for decayed and inferior stuff that occupied the bulk of the vessel. The exhibitor, I am told, is an old offender, and has received one warning. It is probable that his last exploit will close his career as an exhibitor in future shows held under the auspices of this society.

It seemed to the writer that the executive committee might improve their arrangements in several respects, and make future fairs even more attractive. The grounds, for instance, are planned on a scale quite too liberal for the comfort of sight-seers. If the articles that from their nature require shelter, were grouped in one quarter, and in an order that indicated some resemblance to an intelligent plan it would save miles of wearying travel. The common complaint was directed at the altogether too magnificent distances between points of interest. Conscientious investigators, by the time they reached the horse stalls, were more sensible of bodily fatigue than of the good points of the animals. It is difficult to imagine, also, why carriages, that are the products of machinery,

should be sandwiched between a collection of vegetables on one side, and organs and bed-quilts on the other, while the remainder of the class to which they naturally belong, is quartered in an opposite direction. I cannot understand, moreover, why organs, pianos, spatter-work, bed-quilts, stoves, and ironing-boards should have any reason for being in a purely agricultural display. In the English shows these wares are tabooed.

The society keeps well within its aims in organizing meetings during the fair for the discussion of topics interesting to farmers, but jeopardizes the success of such gatherings, by appointing them to take place during the evening, when it is manifestly inconvenient for those most interested to be present. The bulk of the attendance comes in the cars, or by road in private conveyances, to remain one day, and evening finds them on their way to, or arrived back at their homes. If these meetings were advertised to take place on the fair grounds, at some convenient hour in the afternoon, all could attend, and it would be a grateful relief, after seeing the display, to listen to practical papers on farming, by speakers who could address them to the purpose. As at present arranged, the evening meetings, usually held in the Court House of the city, are very meagerly attended, and are a very pronounced failure. The papers read this week, were, with two exceptions, mediocre, and those who came to learn, remained to scoff.

The show of

CATTLE,

as a whole, was large, varied and excellent. The four hundred and seven entries, which are printed in the catalogue, were more than enough to fill the permanent sheds, hence others were erected of a temporary character, and these were filled. The printed list calls for two interesting breeds of polled, or hornless cattle, the Red Norfolks and the Galloways, which are black, but neither of these was present.

The Shorthorns numbered sixty-seven entries, the Devons sixty-one, and a noble show they made; the Herefords only eight, but very fine. The Ayrshires came next on the list to the number of ninety-nine; Holsteins, under which absurd name dear old Holland, the motherland of so many New Yorkers, is robbed of the credit of her superb breed of milch cows,—the "Holland" cattle numbered forty-eight, and were the conspicuous feature of the display. Of Jerseys and Guernseys (Channel Island cattle), there were sixty-five entries. This comprises all the well-bred cattle entered as such, with the single exception of Mr. William Simpson's Brahmins, which it may be well to make a note of here.

The Brahmin cattle of India were represented by a cow and yearling heifer of great beauty, being of a light silver-gray color, with black points, and most deer-like and perfect limbs. They had, indeed, the awkwardly-set horns, pendulous ears, and deep-hanging, thin dewlap, with the hump above the shoulders characteristic of the breed, but these are beauties, if we only view them so—certainly they have been thus bred for centuries to which the record of man runneth not back. Deep-bodied, soft-hided, well-uddered, with well-shaped teats, the old cow gives, small as she is, nine quarts of milk a day, and when fresh, eight pounds of her milk make a pound of butter. This is as well as most Jerseys will do, and certainly indicates possibilities for this breed as butter cows, which may be worth developing. Besides it should not be forgotten that they are natural trotters and very pleasant saddle beasts.

It was a disappointment not to see more Shorthorns, forgetting for the moment, perhaps, that the glory of New York had departed in some measure in this particular breed. Many shown were, however, of great excellence. The notable exhibits in this division were those of F. C. Cornell, of Ithaca; Daniel B. Haight, of Down Plains; Carlos Prince & Son, of Catharine; Benjamin Fellows, of Clifton, and A. B. Benham, of Cortlandt. These all exhibited herds of one bull and five females. Besides, Miss O. M. Dering, of Utica, showed Baron Bates, 2d, a fine old bull; E. F. Cabon, of Owasco, one of the best shaped bulls on the ground; M. B. Ritter, of Waterloo, several, notably fine; and J. D. Chaffee, of Gilbertsville, a number of well-shaped animals.

Whenever the State Fair comes to Elmira, we feel as if the Devons, this most beautiful and useful breed, were gaining in public favor, and likely to take the position they really merit as the leading breed of the Eastern States. These cattle have every thing but size; and they are nearly twice as big as they look. They are beautifully formed, easily bred, are thoroughbred of their own true inwardness; they make better beef than Shorthorns, and will thrive where the larger breeds would starve. The cows are grand milkers, many of them (but the butter is pale), while as working cattle they are very docile, and as quick as horses. All this, while their rich, red color, without a fleck of white, and their superb slender, waxy, yet white horns, set them off in striking contrast to other breeds. The principal exhibitors were Messrs. Walton Cole, of Batavia; B. F. Peck, of East Bethany; Mrs. Wm. E. Arnold, of Otego; Joseph Hilton, of New Scotland, and D. & J. Banker, of Franklin Forks, Pa.

That admirable beef breed, the Herefords, was shown only of Mr. JOHN MERRIMAN of Haysfields, near Cockeyville, Md. His herd consists of one noble bull three years old, two cows, two two-year old, and two yearling heifers, and an excellent representation of the breed it was. Its characteristics are great length and depth of body, well-developed beef points throughout, red color with white head and extremities, the white frequently running back from the head upon the back and usually along under the belly. The horns are of medium hight and frequently curve downward. For quick fattening and ability to carry immense quantities of flesh and fat it contests the palm with the Short-Horn.

The Ayrshire breed has grown greatly in favor among the farmers of Central New York, keeping pace with the growth of the cheese interest. Their great yield of milk has led to this, as well as the fact that its quality particularly adapts it to cheese making. The shows comprised some of the best animals I have ever seen both in the matter of form and comeliness, and in milking qualities. MESSRS JARDINE & SONS of Hamilton, Canada, showed most excellent animals. As also did F. P. & A. M CORNELL of Sylvania Pa., JAMES MILLER & SON of Penn Yan, and CHARLES STILLMAN of Alfred Centre, N. Y.

The Holsteins, so-called, were the most interesting feature of the cattle exhibit. The principal exhibitors were Col. H. C. Hoffman, of Horse-heads, W. H. Gifford, and Smith & Powell of Syracuse, and the Unadilla Valley Breeder's Association of West Edmonston. Besides those who showed herds, W. H. Gifford of Syracuse, and James Black of Stanley, each exhibited a number of animals of marked excellence. The enormous quantities of milk produced by many of these cows, makes them great favorites wherever introduced. Those yielding more than 30 quarts daily are common, and there were several for whom a yield of over 40 quarts was claimed, we doubt not with entire fairness. They are pure black and white; amount and disposition of the color being entirely irregular, except, a preference is given for white switches, and, curiously enough, for black tips to the teats.

There were four Jersey herds exhibited of the five entered. They were shown by Wm. Crozier of Northport, John D. Wing of Millbrook, Wm. Simpson, jr., of New York (farm at New Hudson), and John P. Gulliver of Binghampton, besides some excellent animals were shown by Geo. Sidney Camp of Owego. The increase of butter factories (creameries) and a foreign demand for our butter, give an impetus to this pre-eminently butter breed, which is quite noticeable in the larger number of fine animals shown from the central part of the State. The cows shown by Messrs. Wing, Gulliver and Camp, are of remarkable excellence as butter producers, and bear the indications of it, in excellent escutcheons, good udders, rich skin, the wedge-shaped form of the entire animal, and in other points of the good milch cows.

The Guernseys were few in number and of only medium quality—still it is gratifying to see them at all. On the whole, an unprepossessing breed, and they certainly have great capacity for improvement in style, and long before this takes place their intrinsic excellencies will demand for them a place as high or higher than the Jerseys now occupy. They are of above medium size—often large; real good cows yield 18 to 20 quarts of milk, make 10 to 15 pounds of butter a week, which is extraordinarily rich in color. They fatten easily, make good beef, and bear large, quickly-fattened calves; are hardy, and good feeders. We shall see them better represented in future years. They were shown by Messrs. Geo. Sidney Camp of Owego, Wm. Crozier of Long Island, and Wm. M. Holmes & Son of Greenwich.

There was an unusually good display of sheep.

The Leicesters being in small numbers made little show. The only entries were made by Henry Hoffmann of Elba, and H. J. Kent of Palmyra.

There were forty entries of Cotswolds, the flocks of Joseph Harris of Rochester, George Ingersoll of Charlton, and Wm. Potter of Johnstown, being conspicuous. Mr. Harris made an especially instructive show not only with his pure sheep, but with his merino grades, showing the effects of the first, second and third crossings, which last might easily be palmed off upon a novice, and even upon some "judges," as full bloods.

Lincolns were shown by T. Walter & Son of Westchester, Pa.

There were thirty-eight entries of South-Downs. Those of John D. Wing of Millbrook being notably superior as a whole. Daniel B. Haight of Dover Plains showed a superb ram and excellent females and lambs; Wm. Simpson, Jr., showed good sheep also.

The Shropshires made quite a figure, and some even rivaled the long-wools in size. Berosus Cook of Otego, Mrs. L. C. Fish of the same place, Henry C. France of Wells, Pa., and G. L. Fletcher of Sidney Centre are the exhibitors whose stock was particularly noticed.

Five Hampshire Downs were shown by Henry Metcalf of Canandaigua. Merinos were in goodly number and many of them seemed of great excellence. I have never seen the Silesians of Wm. Chamberlain of Red Hook, and of his herdsman, Carl Heyne, look better.

There were some two hundred entries of Swine, and the animals exhibited must have nearly doubled this number. The prominent features of this class were the Durocs shown by Wm. M. Holmes & Son, the small Yorkshires shown by W. H. Cole of Clinton, N. J., H. H. Ingersoll of Owego, Henry Hoffman of Elba, and some others. The Chester Whites were shown in great numbers by T. Walter & Sons of Westchester. One of these pigs, a boar which had attained an enormous size, attracted great attention. There were, besides, other excellent exhibits of this breed. The Berkshires were numerous and excellent. Harris's Essex pigs were shown in fair numbers, and several others had good specimens.

Clydesdales, Percherons and their crosses, thoroughbreds, jacks, mules, etc., were in force. Smith & Powell of Syracuse made a noteworthy showing of Clydesdales.

POULTRY

was manufactured to order and sold for ten cents a piece, done up in a nice little box. This pleasing result was possible through the efforts of Mr. A. M. Halstead of Rye, N. Y., and Mr. Frank Rosebrook of Elmira, who each had an incubator in active operation. The births were numerous, the infants happy, and although orphans in a peculiarly impressive sense, they swallowed their grief and appropriate food with as much *sang froid* as if they had the address of their parents. Mr. Halstead secured first premium on his incubator. Not half of the entries in this department were represented, but considering the season, which is not the best in the year for showing poultry in perfection, the display was creditable. Geo. W. Chidsey of Elmira secured the largest number of premiums and a certificate of merit for the best collection. He was the largest exhibitor. D. C. Waterhouse of New Haven, Conn., came next. E. A. Scott of Elmira, had several coops of finely marked Plymouth Rocks. The birds of this so-called breed were large, uniform in color, and greatly resembled Leghorns gone into half-mourning. The usual breeds were very generally represented, and there were ducks turkeys, pigeons and rabbits galore. The points of greatest interest next to the incubators were coops of capons and Japanese pheasants. Capons comprised a cockerel and pullet. The male bird, caponized in July when three months old, now weighs seven pounds.

Caponizing is a very simple, easy operation and its result is to supply the table with a fowl whose flesh is most delicious. There is always a good demand for capons in city markets, and I should recommend farmers to try their skill at it in their own barnyards. The Japanese pheasants shown by WM. W. ALLEN of Elmira were the other attraction. They are interesting fowls, beautifully pencilled and with pleasing combination of colors. Their eyes are clear, mild and expressive—an unusual feature to compliment when speaking of poultry. There was a beggarly array of

FARM PRODUCE.

not a third of the entries filling. A number of barrels of stuff, for this department arrived on the last day of the fair in time to be sent home as they came. The premium for the best bale of hops was triumphantly carried off by the solitary bale exhibited. The dairy interest was very feebly represented and the potatoes though numerous, were small. O. J. Lewis of Schodack Centre showed fifty-six early and ninety-seven late varieties, but nothing new. Brownell's Centennial was the handsomest potato. The Beauty of Hebron was not nearly as fine as those raised on our Experimental Farm. Tillinghast Bros., of Factorville, Pa., had the most notable display of seed as regards variety, and the mammouth beets, etc seemed at great pains to support their lonely dignity. A stalk of white prolific corn grown by M. F. Wanamaker, Jackson, Pa., planted May 23rd, had attained a hight of 14 feet 3 inches, and consequently over-topped everything in the building.

FLORAL HALL

was a tent, and on Thursday night its northeast side blew down and demoralized everything within. Here again the entries exceeded the display, and the latter was nothing to speak of. In the professional list Ellwanger & Barry had a number of cut flowers that were not in the catalogue, and their full effect was lessened by their arriving more or less crumpled and damaged. The dahlias, phloxes, verbenas, bouquets and ornamental floral designs were neither impressive nor original in a marked degree, but the fruit was quite fine. More method in its arrangement would have enabled one the better to judge of its merit. Ellwanger & Barry, the Ithaca Farmers' Club, Mr. Van Dorn, and a nameless exhibitor, showed the best plates of apples. Mr. Ricketts has some twenty plates of his seedlings, prominent among which was the Lady Washington grape, but none of the bunches were as fine as this gentleman could, no doubt display, under more favorable circumstances. Next to the cattle,

IMPLEMENTS AND MACHINERY

were the strongest exhibit. Many of the well-known agricultural implement companies were finely represented, and there was an unusual number of new inventions of merit. The plows were out in great force, and the thrashers, run by steam and horse-power, went through the motions of threshing an immense volume of grain.

The engines of civilization were represented by the RURAL NEW-YORKER, the *Rural Home*, Elmira *Gazette* and *Advertiser* and the *Husbandman*. The two latter papers were printed on the grounds during the Fair by the *Advertiser's* new Campbell press.

There were mowing and reaping machines, horse-rakes, grain-drills and self-binders in bewildering variety, and among churns a new model, the "Monitor," is sure to gain the suffrages of the lazy people (and they are the largest class), because of its facility in making good butter quickly.

The fine wagons and carriages were monopolized by the Cortland Wagon, and the Watertown Spring Wagon Companies, while a new iron farm wagon was the newest thing on wheels. The grange wagons—wagons fitted up in artistic (?) representations of fruits, farm scenes, etc., had a tent unto themselves, and were the admiration of the ladies. A detailed mention of farm implements will be found in another part of this issue, which will fitly close this report of the fair. The writer wishes to express his obligations to the *Advertiser* and *Gazette* for courtesies rendered the RURAL, and to Col. M. C. Weld, for kindly supplying the facts embodied in the cattle report.

C. H. E. R.

IMPLEMENTS AT N. Y. STATE FAIR.

THE display of plows on the grounds was very generally commented upon. The competing companies were liberal in the number of implements, but the Syracuse Chilled Plow Co., of Syracuse, New York, was in advance of rivals in point of numbers, and in the taste evinced in the disposition of the exhibit. Visitors had no difficulty in seeking the class of plows in which they were interested, and could scarcely fail to note the good points of the implement, even when not attended by a salesman. The Syracuse Company are men who believe in the claims they make, and the officers of the corporation seem to think it a part of their business to represent their manufactures, hence, visitors are welcomed by the responsible heads of the concern, as well as by their energetic assistants.

There can be no question of the popularity of the Syracuse Chilled plow, if we may judge by the fact that their entire exhibit comprising over two hundred plows, had been sold out on the fourth day of the fair.

The Syracuse Chilled Plow has attained its great success and large sales within a little over two years. It is not only the character and quality of the metal, but the excellence of its model, that have been its strong points. The process of chilling the metal in use by this company is different from all others, and while they secure the wearing qualities of steel, they discount the prices of such plows. They scour in any soil, and from repeated tests, have established their lightness of draft. The land-side has an adjustable play of a half-inch, to suit different conditions of plowing, and the minor details such as adjusting the handles, and the working of the clevis, are characterized by a finish and ingenuity that are admirable. The plow is equipped with a perfect wheel, with four bearings that render it almost indestructible, while the mechanical ingenuity with which it is put together is admirable. Altogether the plows, the exhibit, and the crowds attracted by both, were one of the strong features of the fair.

THE "KING OF THE LAWN" Lawn-mower, Osborne's Sulky Plow, and the "Meadow King" mower were the chief features of the exhibit of GREGG & Co., Trumansburg, N. Y. The lawn-mower is quite new, and posesses some very fine points that have secured for it a wide popularity. The Osborne Sulky plow attachment is too well-known to need comment, and as to the Meadow King mower, it has been so long before the public, and has done such admirable work, that there are few who do not appreciate its merits

E. M. BIRDSALL & Co., Pen Yan, N. Y. made a fine display. Their large separator was in operation, driven by steam power. Although no grain was fed to the thrasher, its smooth, steady motion enabled judges to form an opinion of its merits. The engine attracted attention by reason of its compact, simple construction, and absence of unnecessary and cumbersome attachments. The firm is behind orders this year, and business is steadily increasing.

KEYSTONE MFG. CO., Sterling, Ill., showed through their general agents WM. H. CHAPMAN, of Utica, a full line of Cider Mill and Sheller, and also Perry's New Iron Frame New York Hay Tedder. These goods have only lately been introduced in the east and are already meeting with a large sale.

JONES of Binghampton made his usual display of good and cheap scales.—Continued on page 608, this number.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Owing to our Reports of Fairs, we must beg indulgence of those whose questions are not yet answered.—EDS]

Treatment of Various Flowers.

Mrs. S. A. Morrell, Wright Co., Minn., asks: 1. Whether Golden Variegated Myrtle suits a fern-case, and whether the bloom is as pretty as the plant. 2. Will it do to leave Bridal Wreath Rose out-of-doors in a climate like that of Minn. 3. Will Lemon-scented Verbena bear the winter's cold with ordinary protection out-of-doors. 4. Her young Artillery Plant though looking healthy and thrifty, has no red spots on the leaves, and she inquires whether the latter should be watered. 5. Should Begonias be watered or allowed to be out in the rain.

ANS.- 1. By "Golden Variegated Myrtle" we presnme you mean a variegated form of Vinca minor, which, though commonly called so, is not a Myrtle at all, but a Periwinkle. It will live well in a freely ventilated fern-case, but as it will bear 20° or more below zero, Fahrenheit, with impunity, why treat it so tenderly? Its flowers appear in early spring, are blue or white —commonly blue, and, though pretty, are not showy.

2. "Bridal Wreath Rose."—If you mean the White Banksian, it is not reliably hardy. Being "a cousin to raspberry" is no criterion of its hardiness; Marechal Niel and Cherokee Roses, by the same license may be called brothers, and neither is hardy North.

3. LEMON-SCENTED VERBENA.—Winter's severity may kill the stems, and, if unprotected, the roots too; hut by cutting over the stems in November, and, before hard frost sets in, inverting a box over the roots, and putting some leaves, litter, coal-ashes or other mulching over the box, you may savo the roots. But the safest way is to dig up the roots and winter them in a cellar or cold-pit.

4. Artillery Plant (Pilea serpyllifolia); keep it in the sunniest window, in a moderately warm room. Occasioual sprinklings of water on its leaves will not hurt them. By next March your desire for "red spots" or flowers may be gratified. The finest specimen we remember having seen was grown in a lady's kitchen window.

5. BEGONIAS—Water lodging on the leaves would spoil them, hot sun will "burn" wet leaves, and a damp, stagnaut atmosphere may rot them, but judicious wettings will not hurt them

Queries about Fruit.

A. C. W., Hugo, Ill., asks: 1. What Bigarreau and what Heart Cherry are likely to do well in eastern Illinois. 2. Could not an analysis be made of the soil in which these fruits flourish best, so than anyone could "doctor" his ground to just suit them, adding any lacking ingredieuts, or even transporting soil from spots where their condition shows it to bo well adapted to their requirements. 3. Is the genuine Fultz wheat early or late. 4. What variety will succeed best on a wild crab-stock; 5. and when would be the proper time to bud it—bark rises now, but buds don't catch.

ANS.—1. Black Eagle, Tartarian, Early Purplo Guigne, Elton, Napoleon Bigarreau. No line can now be drawn between many of the Hearts and Bigarreaus, owing to hybridization.

2. Any good, mellow, dry soil will furnish all that the cherry needs so far as food is concerned. Climate must do the rest.

3. Intermediate.

4. Any variety will succeed upon it.

5. It is getting rather late now for this year.

To Exterminate Crab-Grass.

C. B., New Brunswick, N. J., asks how to exterminate Crab-Grass from his lawn.

ANS.—This blooms from now until cold weather. Frequent use of the lawn-mower is the only remedy, and this we have found but a partial one since a good part of the "fingers" spread out upon the lawn and elude the knives, thus maturing and sowing their seed for another yoar.

Miscellaneous.

M. W. F. Bryn Mawr, Pa. The plant is Plumbago capensis.

Anon, asks what kind of strawberry would be the best for family use where hardiness, productiveness, and good eatable qualities are required.

ANS: We must, in this case, refer our friend to the exhaustive articles on this subject, in RURAL of Sept. 7.

Moore, East Hampton, Mass., asks how to cover a roof properly with gravel.

ANS: First apply a layer of paper or felt, then melted tar, on which throw the gravel, and finally level it smoothly.

T. C. Denton, Daleville, Va., asks where he can get good iron water pipe at lowest rate.

ANS: Thos. C. Bashor & Co., Light St., Baltimore; Thompson & Co., (Alex. Shepherd,) Washington, D. C.; Morris, Tasker, & Co., Philadelphia, Pa.; McNamara & Smith, Lynchburg, Va.

C. L. T., Louisville, Ky., asks, 1. For the names of the best works on the cultivation of berries, such as strawberries and goosoberries. 2. Also on grape culture.

ANS: Roe's Manual on the Culture of Small Fruits, price 50 cents. 2. Phin's Open Air Grape Culture, $1; both to be had of the Orange Judd Co., N. Y. City.

C. J. S. Fowler, St. Lawrence, Co., N. Y., asks whether the RURAL acknowledgos communications which are not used?

ANS: Yes; every communication intended for publication, is acknowledged by the publication of the author's initials, under the appropriate heading, in the issue sent out next after its receipt.

L. M. Brown, Onondaga Co., N. Y.—The plants are Amaranthus tricolor, and Euphorbia marginata.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, SEPTEMBER 14TH:

NOTES FROM ILLINOIS.

HUGO, Douglass Co., Ills. 1878.

RATHER than have an orchard distant from where I live, I put out trees in my garden several years ago, and the culture, together with the manure necessary to a good garden, pushed the young trees on rapidly, doubtless too rapidly for early bearing, yet I cut back, in the fall, and this season I headed them back severely for two reasons: first, to prevent them from making so much wood growth and forming fruit spurs, and second to make them ripen well an already excessive growth. Many leaders grew three and four feet this season. If I am any prophet, and as a rule I think I am not, next year you will hear of more fruit trees (young) damaged by the approaching arctic winter, than we have heard of for probably an entire decade. The excessive and long-continued heat is nearly sure to be followed, as it has been as a rule heretofore, by a severe winter, and the rather wet season, together with the high temperature has conduced not only to a prodigious growth in trees, but also to a late and continued growth, which, overtaken by severe cold, will either be damaged or killed outright. Mildew has made its *debut* in this vicinity, at last, in earnest. Among my vines, Clinton, Walter, Agawam, Worden, Salem, Goethe, Brighton, Champion, Diana, are all milldewed, and Concord standing near Clinton vines whose foliage is nearly all lost by mildew, has a few leaves here and there diseased. Croton, Delaware, Lady have escaped, and Martha partially.

I have given the Acme Tomato a pretty good trial this summer, and certainly it is the finest tomato in cultivatiou. It could not be nicer, in any respect. A. C. WILLIAMS.

RURAL SPECIAL REPORTS.

ROCHESTER, Monroe Co., N. Y., Sept. 5, 1878.

FOR the past few weeks the weather has been warm during the day, followed by cool nights, with frequent showers and heavy dews favoring the growth of trees and thorough ripening of wood previous to our usual September frosts.

Grain is pretty much all thrashed and the yield, though good, is not as large as was anticipated. Spring wheat and barley have been almost an entire failure, many farmers not getting their seed. Winter wheat is reported at an average of twenty-two bushels per acre, with here and there an unusual yield—some of my neighbors having forty-two, and as high as forty-six bushels per acre. Oats are light and a moderate yield—our crop will go forty bushels per acre—but they weigh only twenty-five pounds per bushel (the seed weighed thirty-six.)

Potatoes are a light crop, and will command good prices, 50c. per bushel being now offered.

Early apples have been a drug on the market at prices ranging from 75c. to $1.25 per bbl.—barrel included. The prospect for winter fruit looks but little better, but a determined effort will be made by producers generally to get $1.50 to $2 per bbl. for it.

The second crop of clover is unusually large, and the heads have filled well. Clover seed will be cheaper than for years.

Corn is of good color, and the ears are filling well.

Preparations are being made for a large seeding of fall wheat, two successive big crops giving farmers more confidence in it than before; then, too, wheat is readily turned into cash, and requires less summer working than almost any other crop. The time of sowing by the majority of farmers will be from the 15th to the 20th, they hoping by late sowing to escape the Hessian Fly. H. T. J.

WOODCOCK, Crawford Co., Pa. Sep. 1, 1878.

THE corn crop will be good in this section and is now being cut up. Oats are a medium crop, but only about two-thirds of that of last year. They suffered from rust and other causes. The wheat was a heavy crop, and was secured in good condition. Buckwheat promises well. Potatoes are almost a total failure—very small and few in the hill. A few pieces which were planted late and escaped the late frosts will give a fair yield, but nearly the entire acreage was planted early and suffered from the frost.

Pears are an entire failure and so are plums. Peaches are a light crop; apples a light crop; but sufficient for home use. Cider apples are in sufficient quantity to supply local demands. M. S.

SHEDD, Linn Co., Oregon, Aug. 31st, 1878.

WHEAT about all thrashed; yield, in this section, about twenty-two bushels per acre; and that of the finest quality. The weather is fine—all that could be desired for harvesting.

Blackberries, Wilson's Early, Evergreen, and Kittatinny are splendid; the Lawton not so good. Apples, plums, pears and peaches, are a heavy crop. I gathered three bushels of Italian prunes from a four-year-old tree and two and a half from a three-year-old German prune. Oats a fair crop. Potatoes light. Grapes good for Oregon; peaches a failure in western Oregon. Wheat, 75cts. per bushel; oats, 35; potatoes $1. P. M. W.

SHERMAN, Chautauqua Co., N. Y., Sept. 3d, 1878.

POTATOES are a very small crop in many parts of Chautauqua County this season. Fall apples are quite plenty and cheap; winter fruit scarce. The corn crop is coming on quite well. The weather, for several weeks, has been warm and dry, with cool nights. A fine shower to-day gives things a fresh look. Butter continues to sell at a low price, as usual. Blackberries have been plentiful. M. L. D.

LAMARTINE, Clarion Co., Pa., Sept. 3d, 1878.

THE fruit crop in this section is almost a failure. Corn only middling, owing to the long-continued drought. Potatoes poor and small. Oats a large crop and cheap; wheat a good average crop, of very good quality. Have had no rain to soak the ground since the 1st of July. D. M. D.

WHITNEY'S POINT, N. Y., Sep. 10th, 1878.

WEATHER pleasant. Corn is an average crop. Buckwheat, of which there is a large acreage sown in this section, is reported as filling well. Potatoes light. Butter, 15@18c.; cheese, 9@10c.; potatoes, 40@50c.; eggs, 15c. per doz.; hay, $6@6.50. M. B. D.

OKOLONA, Chickasaw Co., Miss.

WE are having too much rain for the well-being of the cotton crop. It rains every day, and that brings on the worm. J. B. B.

Miscellaneous

LIME BURNING.

IF lime could be bought cheap, and conveniently obtained, who can doubt that farmers would use far more of it than they now do? If they had it, not a month would pass without some use being made of it. Cellars and additions would be plastered, and where rock and gravel and sand were handy, concrete buildings would be put up, clover and wheat lands would be dressed with it to their great benefit, besides the many minor uses to which it would be put. That lime is not made and used more than it is by farmers, must be, I think, owing more to their want of knowledge of how to make it, than to their ignorance of the uses to which it is adapted.

I do not propose in this screed to detail the methods of the "perpetual," or even of the "periodical" limo-kilns, although I believe the last-named would be profitable to any large farm. I merely wish to give two practical methods of burning lime, in common use among those with whom lime burning is not a business.

Here, where timber is abundant and of little or no market value, we select a gentle slope where two trees stand some ten feet apart. On the ground we place two logs each 12 feet long, parallel with each other and 10 feet apart, each log stretching from the base of one of said trees up the slope. We have a lot of logs cut, 12 feet long, and we roll them on to these parallel logs, the first one against the two trees, the second against the first, and so on till a floor of logs 12 feet wide is made. We then "chunk" all the spaces as if we were making the wall of a log-house; then roll on another layer of logs, and "chunk" as before till the pile is from three to six layers high, according to size of logs, placing all the logs in the same direction, except the two on the ground which serve as andirons. On the top we then make a pyramid of the rock to be burned, 10 feet square at base and as high as you can heap the rock. No fragments should be left larger than a man's fist. Dry branches and kindling wood are placed between the andiron logs before the first logs are rolled, and these are now set on fire and in from six to eight hours, the immense, solid log-pile is burned away and a heap of quick-lime lies on the ground, which you can begin to haul away by noon of the day after firing, if you fire at dusk the night before.

By this method fuel is wasted, and the rock must be pounded fine, and even then many of the pieces will be imperfectly burned; but so little knowledge or skill is required that any one can make lime in this way. To know what rock to use, pieces can bo tried in the fire-place or stove.

Another method is in use and economizes fuel. This consists in making alternate layers of cord-wood and broken limestone in the form of a charcoal pit, covering the whole with leaves or straw and then with dirt. Fire in the center and draw to circumference in the same way a coal pit is managed. This method not only economizes fuel, but burns the lime more evenly and perfectly. N. W. BLISS.

Kingston Furnace, Mo.

THE GREAT AMERICAN DESERT.

R. H. CRANE.

TRANSFORMATION.

IN our early school days we were led to suppose the Great American Desert to be to America what the Sahara was to Africa. The earliest explorers who traveled the great plains, and fought their way over the "Rockies," described this eastern mountain slope as an arid waste. Its scanty vegetation scarcely afforded food for their mules; millions of acres of sand stretching all about them, created the impression that this was a God-forsaken country. The settler of to-day who sees before him hills and valleys covered with nutritious grasses, wonders whence the early delusion. I am inclined to believe it was not a delusion. These early adventurers simply described the country as they found it, with only the usual amount of traveler's paint. It is not their fault that a most wonderful change has come over the country within less than half a century. Prof. AGNEY, our scientific savan, says this loess formation is like the banks of the Rhine and cannot be exhausted until the particles of which it is composed shall be carried to the Gulf. With little or no rain there could be but little or no vegetation. With increased rain-fall the grass belts, found formerly skirting only the scanty streams, silently spread over the plain.

EARLY SETTLERS.

The settler, moved by the spirit of enterprise, mingled with love of adventure, staked his claim still farther toward the setting sun; and, though often grass-hoppered, run off by hostile Indians, and as often cut off by droughts, his prophetic ken was sharpened in this atmosphere, which was life-elixer, and as he remembered the "chills" and "shakes" of his father, he exclaimed, "I have faith that this country will come out all right, and I mean to stay." He has stayed to see the last red-skins chase the last herd of buffaloes over the western hills, neither ever to appear again. He has stayed to see the grass-hoppor scourge decrease and the rain-fall increase, the blessings of civilization spring up all around him, churches and school-houses dot the land. Ceres fills his graneries and Pomona pours into his lap her choicest fruits.

SCIENTIFIC DROUGHTS---ACTUAL RAIN-FALLS.

Fremont is credited with saying "It never rains in Nebraska." PROF. DANA has given us the reason why this unfortunate eastern slope of the Rocky Mountains can never have rain, and hence, can never be depended upon to bear any considerable portion of the earth's over-crowded population. His theory is that clouds arising from the Atlantic will be robbed of their moisture by the hungry fields of the Eastern States, (QUERY.—What is a cloud deprived of its moisture?), while on the other side, according to him, the Rocky Mountains cut off the clouds from the Pacific. DANA'S premises were pretty well taken, but his conclusion was a *non-sequitur!* My theory is that we get our rains from the Gulf of Mexico. Our prevailing summer winds are from the south or southeast. For a number of successive days the wind blows steadily from the Gulf; then, usually at night, the current changes, and from the west or northwest the condenser comes and the refreshing shower falls. Nine times out of ten our rains are in the night. Within the last decade our immigration documents have boasted that our rain all falls in the growing season. No writer to-day would venture to say that no rain falls in mid-winter.

RAPID SPREAD OF AGRICULTURE.

A few years since, a line seventy-five miles east of the place of writing this, was supposed to mark the outmost boundary of safe agriculture. To-day all around me, and for a hundred miles west, the earth is burdened with heavy crops. The rain-fall has been complete. During the last Congress a move was made to vacate forever the western counties of Nebraska in favor of the cattle raisers, under the impression that the rain-fall would forever be inadequate to successful agriculture. To this, in behalf of homeless thousands, a protest has gone up from all along the line; and, in confirmation of the wisdom of the protest, to-day an ample harvest is being gathered as far west as the

soil has heon cultivated. So rapid has heen the change, that men who, twenty years ago, settled in the valley of the "Big Muddy," (Missouri) believe theirs the only tillable portion of the State.

A PROBLEM FOR WISEACRES.

Whence this wonderful change is a problem for our wiscacres to solve. I am inclined to the opinion that it is a grand illustration of the power of mind over matter. I havo conferred with pioneers from Chicago westward, and learn that theso climatic changes havo ever occurred simultaneously with the wave of immigration. Each successive settlement has secured the partial conditions of the success for a settlement beyond, and eventually made its own conditions of success permanent. Persistent cultivation insures successful cultivation.

Harlem Co., Neb.

WHAT OTHERS SAY.

Depth to Sow Wheat.—Mr. Peffer says in the Trans. Wis. S. A. S.: "The sooner the kernel sprouts and gets above the ground the better and stronger the plant and the thicker it will stand. To illustrate: in my younger days, I made experiments with the depths of planting wheat; I planted the kernels of a whole head in this manner: in one of our garden beds (ground spaded twelve inches deep) 1st, kernel on the surface; 2d, one-fourth inch deep; 3d, one-half inch deep, and so on (a quarter of an inch deeper each time) until the kernels were planted. The results—the one on the surface lay nearly two weeks before it sprouted and made roots; the 2d, one-fourth inch deep, and up to three-fourths came up the 4th and 5th days, while the next were later; the last one up, was fourteen days in reaching the surface, and was three and one-half inches deep; none came up after that time; on examining, I found that the three next kernels were sprouted, but rotted before they got the sprout to the surface; the kernels planted from five to seven inches deep rotted without a sign of sprouting. We had the kernels planted six inches apart in two rows. At the end of six weeks, the plants stood thus: the first had three straws quite strong; the one-fourth, 21 straws; the half-inch, 17 straws, and so on; three and one-half inch, a very weak single straw; it never got strong, although it grew a small or short head, the few kernels it contained were plump and good; the one inch had eleven straws at six weeks, but only perfected seven good heads, while the one-fourth inch perfected twenty-one good heads. The one on the surface made three good heads, the same as the one planted two inches deep."

"Slates," says the Boston Journal of Chemistry, "are extensively used on roofs, and sometimes on walls. Unless of the very best quality and put on with extreme care they suffer much from breakage and leakage. Welsh slates used to be the best, but of late years they are cut so thin, when intended for the American market, as to be very weak. Good slates are quarried in this country, the strongest coming from Maine. In order to be sure that a given kind are all that is required for strength and durability and unchanging color, the best way is to buy of a well-known and reliable dealer; and as dealers, even, may be deceived, it is best to examine the lot thoroughly for one's-self, and apply all the well-known tests. Slates that are found near the surface are likely to be inferior to those obtained deep down in a quarry that has been some time worked. A clear metallic ring is evidence of hard, close grain. But perhaps the best test of all is immersion in water; the slate which absorbs the most water in a given time being the most porous, and consequently the worst. Porous slates, in addition to their tendency to soften and decay, retain moisture which rusts the nails and rots the roof boards. They are also, when wet, liable to be cracked by frost. Slating nails should have large heads. "Composition" nails are, of course, the best, but expensive; well-tinned iron ones are good enough; those of common iron are too liable to rust."

The American Dominique, says the Poultry Bulletin, is a valuable breed of Puritanic extraction, and wherever bred in purity, is acknowledged to be one combining as many desirable qualities as can well be found in one variety.

Its hardiness, symmetry and general utility are only the more appreciated by the addition of harmony of colors, being so blended as to be always pleasing to the eye. Like memories of bygone days, always growing in remembrance, the American Dominique, so justly entitled to the appellation, comes to the front, amidst the furore for something new, claiming our attention for long-established virtues, and for its present improved appearance.

The Dominique is an excellent layer of medium-sized eggs, supplying them with remarkable persistency the year through. Though not a rank sitter, it practices the truth of the adage "what is worth doing is worth doing well."

The young develop rapidly, and at maturity are second to none for the table. One very commendable quality is the ease and rapidity with which they molt, the new feathers following quickly the loss of the old ones, and they frequently continue their laying during this trying ordeal.

Sheep for Kansas.—In the Weekly Tribune, Dr. Challis asks the question, What sheep is best adapted to the wants and ability of the masses? and answers it thus: It is the common coarse or medium-wooled sheep—the "Missouri sheep." Cross these for two generations with the thoroughbred Merino, then throw in a cross of Cotswold, and you have a sheep producing a large clip of desirable quality, and a carcass big and well rounded for mutton. Such sheep can be found for from $1.50 to $3 per head, and an acre of ground—well stocked—will support eight or ten of them. For medium unwashed wool, for three years past, we have received at our door, respectively, 25 cents, 24 cents, and 23 cents per pound. This makes about $1 per head, or sufficient to pay the running expenses of the flock, leaving the increase and growth to the side of profit.

Machinery on the farm means a good deal, remarks the Scientific Farmer. It means that the farmer has invested much capital in a way that is saving him much hard work. It means short days for you and the hired man. It means going to bed later and getting up later. It means less weariness and more opportunity for mind-culture. Thus progress in agriculture not only means more and cheaper food and clothing, but it means greater opportunity for development of manhood. Let us welcome it, then, for the stomach's sake, the body's sake, and the mind's.

Manure a Specific for all Wheat Ills.—Manure, "Waldo" of the Ohio Practical Farmer says, seems to be a specific, a sovereign remedy for most if not all the ills that wheat is heir to. His early sown wheat, last fall, was as badly infested with the fly as he ever saw, but where it was manured a heavy crop grew in spite of it. A few years ago the chinch bug made its appearance, and much of the wheat was badly damaged, but where it was manured it escaped. In the years when wheat has rusted badly it has always been the weak, late wheat, on poor land, that has suffered most.

To keep Lice at bay, Mr. G. P. Burnham says, the fowls and their nests should be thoroughly clean, constantly. By using a little powdered sulphur on their bodies, and carbolic powder, also, rubbed into their feathers and through the hay of their nests, vermin will disappear. In warm weather, wash the roosts all over (and underneath) with kerosene, to destroy these parasites. Thus they may always be kept cleanly and comfortable, with but little labor, if this be *regularly* attended to.

W. J. F. tells the Country Gentleman that some of our best farmers intend to sow only four or five pecks of wheat per acre. Their idea is to grade the wheat, selecting all the large grains. This, they think, will give as good a seeding as two bushels sown in the usual way. Using some concentrated manure where the young plants can get it, will cause them to "stool" and cover the whole ground.

Ventilation of the Hen-Houses is an important thing to be observed by fowl growers, at all seasons of the year and especially in the months when the birds are limited to indoor confinement. Foul air in the houses will generate disease, rapidly. *Roup* is thus caused, and sickness will surely crop out among the flock, if they do not get fresh air, and plenty of it, at any time of the year.

Horse Shoes.—The London Farmers' Chronicle thinks that we require to protect the feet of our horses something after the manner we protect our own, and one would suppose that the matter of fitting a boot to the foot and leg of the cart horse ought not to be attended with any insuperable difficulty.

CATALOGUES, &c., RECEIVED.

The Grasses of Tennessee, including Cereals and Forage Plants, by J. B. Killebrew, A. M., R. D., Commissioner of Agriculture, Statistics and Mines. Published by the American Co.: Nashville, Tenn. On the first appearance of this work, a few weeks ago, we mentioned in the Rural the favorable impression made on our mind by a cursory inspection of its 500 pages. Since then we have had leisure to examine it more critically, to check its teachings by the lessons of our own experience and that of others, to test the accuracy of its statements and information on a multitude of points, and as a result, our original impression of its merits has been strongly confirmed. Its title, The Grasses of Tennessee, may possibly mislead some into the notion that its contents have reference only, or in a great measure, to that State, whereas its teachings are applicable wherever grasses, cereals and forage plants are cultivated. The information here laboriously condensed, has been culled from the best works on the subjects treated of, published not on this side of the Atlantic only, but also, to a considerable extent, on the other, and the utility of its lessons is as broad as the field from which they were gathered. In view of the vast and steadily increasing importance of the hay and fodder crops, as well as of the pastures of this country, it behooves every farmer to "post" himself thoroughly on the sorts best suited to his climate, soil and condition, as well as on their most profitable culture and management, and to this end we know of no work which we would more strongly recommend than the handsome volume before us.

Entomological.

WHAT BECOMES OF THE INSECTS?

Of the seventeen-year locusts we have a biographical sketch. They make their appearance at regular times, and their hegira can be foretold like the eclipses; but of the many other noxious insects that come and go, without any regularity or any apparent cause, we—the laity—are left entirely to conjecture an explanation of the causes which move them.

This city—Muskegon, Mich.—has been called "The City of Sawdust," but a due regard to its merits would have given it the more historic and euphonious name of "The City of a Thousand Oaks." Some sixteen years ago, the White Oaks, the predominant variety, were infested by a measuring worm which entirely denuded every tree of that variety. I have never seen one of these worms since.

Some twenty years ago, when living in Ontario Co., N. Y., my own grape vines and those of my neighbors for miles around, failed to put forth leaves from their normal buds, and, when they should have dressed in a full suit of green, they showed scarcely a sign of life. This we found to be caused by a little steel-blue beetle that we had never before heard of. I have seen but a single specimen of the "varmint" since.

Well, good-bye to them. For the present we are more interested in the inevitable cut-worm that, for the past twenty years, has cut down our young garden and field plants, climbed our young trees and grape-vines and destroyed their first buds by eating out their tips, and which now threatens to desert us, there not being one this year where thousands were expected.

The disgusting larvæ of the codling-moth, too, is threatening to leave us, and we are once more blest with fair, sound apples in our market. Of both of the last-named pests there are some lingerers, and we are now rehearsing a requiem, to be performed when the rest pass away.

The industrious potato beetle has evidently come to stay, bringing his baggage and all his worldly goods with him. He even exceeds the old fabulous hydra that, where one of its many heads was cut off, produced nine others; for the destruction of one is followed by thousands. But, though we lose some of our entomological specimens, we need not slack up in our study of the science; for we have lice—I beg pardon, aphides—in the greatest profusion. They swarm on our fruit trees of every variety; they cover whole acres of cabbages and rutabagas, and slugs riddle the leaves of the Pear, Cherry, Quince and Mountain Ash. The lice are too many for us; but the slugs, if they are noticed in season, we can conquer by dusting them with lime, ashes, plaster, or even dry sand. Just now our attention is specially called to the little vine-hopper, or thrips, which swarms on our grape-vines, making them look as though scorched by fire. For their destruction or expulsion I have tried every remedy that I could hear or read of, and some more, with little success, though I think that sprinkling the vines with sulphur and lime has disgusted them somewhat, for they are not as plentiful as last year. Did we know positively how and where and in what condition they pass the winter, we should know better how to head them off. If anyone can give any information on this subject, or give any reliable remedy, I will be thankful in proportion to the benefit I may receive. S. B. Peck.

Veterinary.

CAUSES WHY HORSES BECOME BLIND.

A great many have noticed that among all domestic animals the horse is the one which suffers the most from ailments of the eye, and the one that gets blind most frequently. There are especially five causes of disease in the eyes of horses.

HIGH FODDER-RACKS.

The first lies in the high fodder-racks. These are in all ordinary stalls so fastened above the cribs, that the animal must pull the hay from the rack in a position which requires its neck to be stretched out, and with its head and eyes turned upwards. Thus it often happens that a beard of grain—which, as every one knows, is armed with little hooks—drops into the eye of the animal and fastens itself in such a secure way, that all the water flowing from the lachrymal duct is not able to remove it. An inflammation of the eye sets in, often causing the loss of that organ in consequence of the false or even cruel treatment to which it is often subjected.

AMMONIA IN STALLS.

A second cause is the sharp and biting vapor in the stable. The sharp ammoniacal gas produced in the stable, which even brings the tears from human eyes, must also do harm to those of horses. It is commonly believed that the latter are used to it, but that idea is totally wrong.

The biting vapor from the stalls, which some think impossible to remove, can very easily be destroyed by cleanliness and careful management. Fortunately there are numerous horse-stables in which there is not the least feeling of it. It is not necessary to use means of disinfection, such as gypsum, vitrol, etc.; cleanliness is a thorough remedy. The floor of the stalls, however, must not be so arranged that it absorbs the urine, etc., and so prepares a substratum of foul smells.

BADLY LIGHTED STABLES.

The horse, although it looks straight forward much more than most animals, yet does not do so nearly as much as man, and therefore requires in its habitation an arrangement of light quite different from that in its owner's dwelling. Give the horse the light from only one side, and it will direct only one of its eyes towards it, but the other eye will be in the shade; this inequality weakens both eyes. Put it in such a position that it looks into the dark, which is certainly unnatural, and when taken out of the stable the abrupt change from darkness to light will harm it. To place it straight against the light, gives the latter a blinding effect which is also injurious to the eyes. The horse-stable should therefore always receive its light from above, either through skylights or through windows placed near the ceiling in the wall to which the animal's head is turned as he stands in the stall. Moreover, the stable should be always bright, as bright indeed as day-light; for the horse is not a night or twilight animal, and is in no need of an artificial darkness, like fattening stock.

THE USE OF BLINKERS.

The fourth and principal cause of the evil is to be found in the use of the blinkers. The eyes of the horses, as it is well known, lie at an acute angle with the nose-bone. They look, therefore, straight out sideways, but command a far larger view than those of men. To prevent the animals from being startled by objects suddenly seen, blinkers are used, square shades which compel the eye to look only straight ahead. But the horse's eye is not constructed for this purpose and is therefore perpetually strained. The inventor of blinkers had certainly the human eye in mind when he hit upon his device. A shade always attached to the human eyes, would be almost harmless, and well fitted to put all objects on the sides of the road quickly out of sight. It is quite different, however, with the eye of a horse. Yet the blinkers forcibly compel him to direct his eye-balls towards the front, thus straining the superior oblique muscle and contracting the inferior muscle. Moreover, imagine the torture and the irritation of having a board, day after day, close before your eyes! Is it astonishing, then, that the horse gets dim-sighted, sick or completely blind? And all this evil is brought about by a device of no earthly use! For the blinkers actually tend to frighten a horse and thus increase the evil of timidity they were designed to diminish or prevent.

THE WHIP.

The fifth and last cause of the blindness of horses is the whip. How often does the fine end of the whip, even in playful whirls, strike the horse's eye and burst therein a blood-vessel or produce an inflammation, and consequently the loss of sight. Even drivers who treat their horses well often do this unwillingly, while only wishing to keep their animals lively and to cheer them up with an occasional touch. But far oftener does the evil occur at the hands of rough brutes who substitute lashes for oats, and, in doing so, are not content to confine their blows to the back and sides, but designedly lash the neck and head, so as to hurt the poor beast as much as possible.

TABLE OF CONTENTS.

PRACTICAL DEPARTMENTS:

Anthropoid Apes—(Illustrated)..... 597
Hints for the Season..... 598
Jottings at Kirby Homestead—Col. F. D. Curtis.. 598
Hints by the Roadside—Hough Handle..... 598
Courage on the Farm, &c.—Gen. W. H. Noble.... 598

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY SEPT. 21, 1878.

HINTS TO CORRESPONDENTS.

NOT the least interesting part of a live agricultural paper consists of the letters from different parts of the country telling of the condition of crops, the local markets and other particulars concerning the districts in which they are written. By this means each reader of the paper is put into communication with a host of correspondents in every State in the Union, all giving the latest account of the business which to him is the most interesting, because it is his own. Under its present management, the RURAL has been fortunate enough to secure a larger number of such correspondents than, perhaps, any other paper in the country; but it is those who are doing well who are always most anxious to do better, and, acting on this rule, the RURAL wishes to suggest a method by which such correspondence, while increasing its interest, would add greatly to the valuable information it furnishes.

This desirable object would be accomplished if our friendly correspondents in stating the condition of their different kinds of crops, would also particularize the varieties of wheat, grasses, fruit, etc., embraced in their reports as well as the comparative merits of each sort in their neighborhood. To do this would doubtless entail a trifle more trouble, but, entirely apart from the greater importance of their communications, they would soon find that this extra trouble would be amply rewarded by the additional information they would themselves acquire in the investigation. It would, also, be well to mention the nature of the soil which proves most suitable to each variety as well as any special treatment which might have produced exceptionally good results. Another point, which with the above would enable readers to form a clear conception of the conditions most favorable to each sort of crop, is the exposure of the land in which it is planted. If grown in a valley, does this valley stretch north and south or east and west, and if the latter, on which side of it are the crops planted?

Many farmers hesitate about sending to their favorite paper valuable information through distrust of their own powers of expression. They are afraid their communications may be rejected on account of grammatical errors, or lack of style. Such fears should never deter our friends from promptly sending us all items of interest, as it is such items we want regardless of the form in which they may be expressed, for it is part of an editor's duty to clothe in suitable verbal garb all information he may deem of sufficient importance to admit into the columns of his paper.

SKILLED DAIRYING.

DAIRYING is perhaps the greatest agricultural interest of New York. It transcends any other single agricultural industry. This State is credited with 1,500,000 cows and if we estimate the income per head at only $40—which is below the average of the last five years—it gives an aggregate of $60,000,000 annually. This represents about one-seventh of the dairy interest of the United States. We shall therefore be pardoned for frequent reference to this great industry. Dairy products are now depressed below any point reached since 1861. But this is also the fate of almost every other agricultural product with, perhaps, the exception of the best beef animals on foot. All mechanical industries are alike at the bottom prices. Shall all these industries, therefore, be abandoned or largely reduced? Certainly not. Dairy products stand at the head of household necessities. No housekeeping, worthy of the name, can be carried on without them. This is the time for the application of skill. Skill must win. When a certain class of products bring a high price, and are eagerly sought as soon as they reach market, the producers are apt to be careless of quality since remunerative sales are so easily made. But when the market becomes heavy and prices fall below remunerative rates, the producers having the requisite courage and determination to succeed, study how to improve the quality of the article, and thus give an exceptional value to it and an extended market. They well know that a superior quality has fewer competitors, and the grades below it are not in competition. The highest quality creates a market for itself.

Acting on this principle those shrewd Quakers, near Philadelphia, have made for many years the famous brand of Philadelphia butter, which has brought from one dollar to twelve shillings per pound. They now easily command four times the price of ordinary butter. And this all comes of *skill*—of regarding butter-making as a fine art, which appeals to our most refined sensibilities—the high art of living. The food that supports the human body is of the highest consideration to civilized and refined society. It is more and more sought for in the highest state of perfection. Cream contains the most refined and delicate oil used as human food. In its natural and best condition, it is more relished and easily digested than any other food oil. This shows what great opportunities nice manipulators of milk have for remuneration, even in these depressed times. The practice of this fine art in butter-making is not necessarily confined to locality, as was once supposed, for the milk, containing cream with all the delicate aroma and flavor of the Quaker butter, flows in many States. The milk exists in thousands of places, but the skilled operators are few.

It really costs no more to make this fine butter than the poorest that comes to market. The skill consists in a knowledge of the nature of milk, and in following very simple and easy rules in handling it. These rules, however, must be strictly followed, and cannot be set aside to suit the convenience of any body. It requires the milk to be kept at or below a certain temperature; the cream to be removed at just the right time, when the milk first turns sour; the cream to be kept at an even temperature, not above 60 degrees, till churned; the butter to be worked with great care and kept at a temperature below 60 degrees, till sent to market. The atmosphere of the milk-room must be absolutely pure, and the cows well kept, and in a cleanly condition. Milk is extremely sensitive to all odors, and easily tainted, after which, the best butter cannot be made. Any one of close observation could determine all these things by experiment in a few months. The dairyman has everything depending upon the skill he uses in the production and handling of his milk. Let him study his business with the same care bestowed by a skillful mechanic upon his, and he will find his remuneration ample and certain.

MUCK.

A GENTLEMAN living less than two miles from us, has bottomless sandy land. He would like at least two good rains every week. During severe droughts, his crops are next to worthless—his shrubs and trees die. He has used muck extensively and likes it not. It has never benefited his land that he knows of. Our own land is rather clayey than sandy. We suffer more from too much rain than from too little. Crops have seldom been injured by drought. We have used muck extensively, also, and we like it. It has been spread upon our garden land in large quantities. Our trees and shrubs have been planted in it—in muck pure and simple—hundreds of them in great variety, and their thrift is the remark of all who see them. At our farm, the upland is seemingly like the land of the neighbor above referred to—sandy and dry. We need rain there weekly, else the grass is burnt and the crops suffer. But we have used muck quite extensively and the land seems to have been benefited thereby. Upon the lowlands we have raised potatoes, corn, wheat, buckwheat, timothy, clover, melons, pumpkins, squashes, beets, mangels, beans, peas, turnips, &c., &c., and we have never yet failed of a good crop.

What does it all prove? That *our* muck contained plant-food which our soil needed. But all muck is not the same in manurial value, as has been shown time and again by chemical analyses. As soils also vary, it is not to be wondered at that different mucks will produce different effects on different soils. There is little sense in advocating its use just as if its manural value were in all cases known and invariable and, for the same reason, there is absolutely no sense in condemning its use *in toto*. It is well that the farmer should take for granted that muck, at least when easily accessible, might prove of great value to his land. Then he will be the more likely to ascertain its value from experiment, which is the only trustworthy test.

Meantime we call attention to the forcible article of Gen. W. H. NOBLE, on another page.

HOME AGAIN.

A private letter from Professor I. P. Roberts tells us he arrived from Europe, on the ship "P. Caland" from Rotterdam, Sept. 7, bringing with him for Howard G. White, of Syracuse, N. Y., seven Holstein cattle, selected in Friesland, and four Percheron horses—two stallions and two mares—selected in the ancient Province of La Perche. The animals were selected without any reference to price, the only instructions given him having been to bring the best that could be found. He tells us that Smith and Powell, of Syracuse, imported on the same steamer, twelve young Holsteins; and that James Nelson, of Brunswick, N. J., brought eight cows and heifers, and one bull.

While abroad, he visited not only the Exposition, but the Agr'l College of France, the great horse districts about Chartres, and Nogent le Rotron, and many other places of less note. He traveled all over Holland, and visited the great farm of Haarlem Mere, situated fifteen feet below the level of the sea. He also saw considerable of Belgian agriculture, though he did not spend much time there. He inspected personally about fifty of the best grain and stock farms of England, including a great sewage farm, Mechi's, Lawes', and the farm connected with the School of Agriculture.

Ornamental Grounds by Moonlight.—The effect of ornamental grounds as seen during bright moon-lit nights for the first time, is deceptive. It is particularly so if the trees are still young, and have not attained much size. The deeper shade which they cast, gives them the appearance of being double their actual size, and of forming vistas that do not exist. Seen again by daylight, one is surprised at his previous magnified impressions. There is this to be learnt, however, from viewing grounds by moonlight, viz., that plants may be so distributed or grouped as to imitate during the day, the deep shadows of the night.

Versaillaise or Cherry?—When the difference between two plants is so trifling that nobody can tell positively one from the other, what is the use of wasting words over it? The Versaillaise and Cherry Currant are in this category, and yet pomologists, as if there were no subject of greater importance to demand their attention, must, like little children, year after year, re-assert their several views. All agree that they are closely similar—a majority that they are identical. It is strange that sensible men can waste their time over such profitless, senseless discussions.

BREVITIES.

THE FAIRS—the fairs!

DR. WILLIAMS confirms our report of Acme tomato.

THE Michigan Agricultural College has had, for five years past, from fifty to one hundred and fifty species of grass and forage plants, all in plots and labeled.

CHARLES W. GARFIELD says that T. T. Lyon is the best Strawberry experimenter in "our State"—that is, Michigan. His strawberry article appeared last week.

THE farmer who bears in mind the oft-quoted words, "the true investigation of nature leads to God," should be moved to study and to observation in his chosen pursuit.

No doubt the present season will be favorable for transplanting trees. They will mature earlier; on account of the early spring, and will have a longer time, after transplantation, in which to become established in their new places before heavy frosts.

ANY honest, industrious man can earn not only a living, but enough to enable him to lay up money for a time of sickness or old age. Yet there are many honest, industrious men who do not. One reason is improvidence at home; another indulgence in strong drink.

DR. ZABRISKIE, a well-known physician of Westwood, Bergen Co., N. J., tells us that he has used with much success the fluid extract of Grindelia squarrosa for malarial fevers, in doses of twenty drops, administered every two hours during the intermission of the fever. As a preventive, twenty drops three times a day have proven effectual.

WE said that we could not find any animals that would eat our Prickly Comfrey. The editor of the Indiana Farmer meets with better success. "Our cow," he says, "will not touch it at present, while on good pasture; probably she might be starved into eating it after grass is gone. The grasshoppers like it so well that they have riddled the leaves with holes."

THERE is no doubt about it that Clawson is one of the most hardy and prolific varieties of wheat cultivated. We have raised this wheat for three years past, and have eaten bread made therefrom during that period. The bread is not so white as that made from some other wheats, and does not so tickle the pride of the bread-maker, but it tickles the palate of the bread-eater quite as well.

A. S. WILSON, an English scientist, has made an elaborate calculation to show the marvelous industry of bees. Starting with the ascertained fact that 125 heads of clover yield approximately 15.432 grains of sugar, and that the proportion of sugar in honey may be roughly estimated at seventy-five per cent., he finds that 2,500,000 clover flowers must be visited by bees to obtain one pound of honey from that source.

L. L. POLK, the Com'r. of Agriculture of N. C., says, and we hope it will be heeded: "Dr. D. E. Salmon, of Charlotte, N. C., is one of the commission appointed by the Government to investigate Hog Cholera, and I earnestly ask our corresponpents and other citizens to communicate to him their knowledge of any diseases, and their extent among swine. This is a gratuitous effort to secure our people against the heavy losses they sustain annually, if possible. Term of the Commission will expire Oct. 15th, and it is therefore important that early attention be given to the subject."

THE editor of the Germantown Telegraph has said from the beginning that Prickly Comfrey was a "fraud." So it has proven to be. But it was worth a trial to find this out. The editor may reply that that *was* found out many years ago. But people forget—then they must learn the lesson again. We are in hopes that those who have made money out of this fraud will—conscience-smitten—invest it for the good of the agricultural public in the dissemination of Pearl Millet, for instance, respecting which we should like to learn the opinion of the editor of the Germantown Telegraph.

SENATOR BLAINE says that the farmers of the republic will control its destiny. Agriculture furnishes the conservative element in society, and, in the end, is the guiding, restraining, controlling force in government. Against storms of popular fury: against frenzied madness that seeks collision with established order; against theories of administration that have drenched other lands in blood; against the spirit of anarchy that would sweep away the land-marks and safeguards of Christian society and republican government, the farmers of the United States will stand as the shield and the bulwark—themselves the willing subjects of the law, and therefore its safest and strongest administrators.

To get angry over trifles is childish; to rave furiously is brute-like; to cherish wrath is akin to the ways of devils. But to suppress an angry impulse is manly—it is wise and altogether lovely. Many of us entertain a sort of a notion that we approach more or less nearly to the character of angels; while angels, possibly, look at us as approaching more or less nearly to the character of devils and brutes. When a man kicks a good horse in the belly with his heavy boots, what shall we call him! When a man curses the laziness of his "hands" because they favor themselves during the heat of our hottest days, though the hay or the grain suffer, is he a devil, or a brute? When a man vents upon his good wife and children the anger which has been aroused by a combination of aggravating circumstances in the field, he is both. There are two grand errors which we revel in as if they were spring water in midsummer: One is our unwillingness to extend to others the consideration we demand from them; the other, that we are more interested in the faults of others, than in our own.

Literary Miscellany.

THE FORGET-ME-NOT.

Mark the forget-me-not by yon brookside,
Its roots the mud, its stem the waters hide;
Its blossoms seek the sky.
So, though thy feet be rooted in earth's slime,
Raise thou thy head above the waves of time—
Look up on high!

See how the blossoms, earthward bent awhile,
Turn as they ope to meet the sun's bright smile,
And, as they upward gaze,
First flush with pink, then mirrow heaven's own blue,
And every flow'ret bears, of sunny hue,
A crown of rays.

O thou whose thoughts are fixed on this world's toys,
Look up to Him from whom are all thy joys.
The beatific sight
Will change thee till the human grow divine,
And at the last upon thy brow shall shine
A crown of light. [*Sunday Magazine.*

THE STORY OF A LOCKET.

(A True Incident.)

CHRISTIAN BYRDE.

The well-known jeweler in B—— Street, at Versailles, sold, unwillingly, to me, a "Prussian," the lovely locket I am holding in my hand; but then why did he expose his antique treasures, which he generally kept so carefully under lock and key, to the experienced eyes of a foreign connoisseur?

Everybody wanted to buy the pretty thing, and at last it was sold for Prussian gold, which is really as good as French. And now the little work of art belongs to me, and is daily admired. It would be difficult to meet with anything prettier or more tasteful. It is oval, and about the size of a walnut, surrounded by a row of pearls, inside which there is a very narrow black enamel border with brilliants; the surface of the locket is of pink enamel, and upon it is painted a charming little Cupid, who, with sly looks and great delight, is blowing into a silver trumpet, as if he were hastening to inform the world of one of his fresh victories. The reverse of the locket is covered b a strong glass surrounded by gold, and inside it could be seen a rose-leaf, broken up into many little bits, the whole hung on to a pretty interlaced pearl bow. With the help of a few dates given me by the jeweler, and a piece of paper upon which was printed, in half-effaced characters, some very old French, which he had found in the case containing the locket, I discovered who painted the small Cupid, and what interesting woman had once worn the locket in years gone by.

Many tears were shed on a bright spring day of the year 1701, in the ante-chamber of the renowned painter and poetess, Sophie Cheron, in Paris. The little god-daughter and maid of the lovely lady, the pretty Cadette, was crying bitterly, for she had met with a great misfortune. A locket, with an angel's head, which her mistress called a "charm," had, as the little one in fun tried it on, slipped out of her hand, and the pink enamel had broken into a thousand pieces upon the hearth. What a fright she had had! Mdlle. Cheron had for years worn the locket whenever she went to a party or entertained guests: she said, half in fun, half seriously, "that it protected her heart." And now? On the following Saturday there was to be a garden fete in honor of mademoiselle's birthday, and she would want to wear the locket, that was quite certain. Sophie Cheron would rather have given up the fete than not wear her charm. And when she asked for the little locket, what should Cadette say? Her thoughts were confused at the idea; her heart beat loudly with fear. Her godmother would, when she heard of the accident, send her away, without pity, that she was sure of. And to leave this happy home and kind mistress, would be a very great trouble, even for the sake of a certain somebody, who was only waiting till they had saved enough, to say, "Cadette, I want you to marry me." Ah! how long this saving up took; it even seemed more difficult for a young man to save, than for a young woman, and for a painter most of all. Indeed, cousin Gillot declared that her husband's pupil, Antoine Watteau, was the laziest fellow alive, and thought himself a great gentleman, and stared at every noble lady, instead of attending to his work, and that he never did and never would do any good. But the cousin was known to have rather a sharp tongue, And this consideration comforted the young girl. Cadette could not blame Antoine Watteau, because he did not admire the jovial figures which Claude Gillot always painted, for she could not bear the stiff, ugly pictures of soldier and peasant life, which he made his pupils do.

She only wished she could have persuaded Antoine, whom she admired on account of his beautiful, melancholy eyes, to paint Saints and Madonnas. But he only laughed at her when she proposed it, and said he would rather paint, from morning till evening, beautiful women in handsome dresses covered with lace.

Antoine Watteau was the first she thought of in her great trouble about the broken locket. He must and would help her, and paint quickly a new charm before her godmother discovered the misfortune. That would surely not be difficult, and surely Claude Gillot would give her a piece of enamel for it; she remembered having seen plenty in his studio; he himself used formerly to paint snuff-box lids on enamel. It was only necessary for her to run across and arrange everything. There was plenty of time as Mdlle Cheron would not wake for a couple of hours, at least.

Somebody was busy in Gillot's studio. Antoine Watteau sat there before his easel; the master and the other pupils had not yet come; the young painter was not, however, working, he was staring before him sadly at the soldiers upon the canvas; even at the appearance of the fresh rosy girl's face, he smiled. This, however, she did not notice; her thoughts were full of only one thing, the broken charm. She related breathlessly all to her young friend, and concluded with the request that he would paint her as quickly as possible a new angel, rose-colored enamel, and put it in.

"But what was the broken angel like?" asked Watteau, laughing; "that is what I must know first."

Cadette started. She had never looked at it closely, and only knew that it had little wings.

"Well, like all other angels!" was the hesitating answer. "Paint an angel according to your own fancy, then it will certainly be beautiful. If you will arrange it all, and bring it to me in good time, then . . ." she stopped, smiling and blushing.

"Well, what then?"

"You may then ask me for a reward. What should you like to have."

"What should I like? To be allowed to look on quite undisturbed whilst your godmother entertains her guests, and to see what they do at these brilliant fetes of which you have told me so much. It will be easy for you to hide me in some corner. Will you grant me that, Cadette?"

She nodded acquiescence, but a cloud was on her brow. So that was what he wished for, only that?

"Bring me the charm, and I will allow you to look on," she said at last, in a low tone, and prepared to go. She suddenly felt in her pocket and took out a little silk purse. "Then I have brought you something to take care of for me; I had almost forgotten it! My godmother gave it to me yesterday. She is so good; I should be very sorry to annoy her. It will be hard for me to leave her, Antoine."

"Dear little one, you should not trouble yourself about that so long beforehand," answered Gillot's young pupil, putting the little purse carelessly into his pocket, without looking at its contents, "the large wooden box is unfortunately far from full, and until the money comes up to the lid, we cannot marry, Cadette."

"Is not the box too large?"

"Oh! no; do you think that I would let my wife wear shabby clothes and work like a common burgher's wife? Never! I intend to have a beautiful studio with large carved chairs in it, and my wife shall wear silk and velvet and carry a fan in her hand, and everybody must admire her as much as myself."

Cadette burst out laughing. "Well, then, you will marry a wife with grey hair, and without teeth, if we must wait until we are rich enough for such things!" she exclaimed.

"Child, your godmother is a proof of how quickly people can make money. Formerly she painted jewel-boxes and fans, and now she gives the most brilliant fetes in Paris. How happy she is!"

"Do not say that; in spite of all her riches, I have often seen her cry; she cannot forget her first lover whom she sent away because he was of too high rank."

"What nonsense you are talking, little Cadette; to send any one away because they are too grand!"

"But it is quite true. When Sophie Cheron was still young, and when she painted ladies' fans, she did one very beautifully for the Duchess de Richelieu, who was so delighted with it that she sent for her, a thing she had often done before, for the duchess was fond of my godmother, and liked having her to talk to. This time, however, she was not alone; a handsome page of the queen's, Robert de la Haye, was laughing and joking with her. He duly admired the lovely painting, but the maiden still more. The next day he called upon the young girl in her father's studio and ordered ten fans of her. He thought it necessary to come almost every day to see how the work progressed, and he always had many suggestions to make; he asked her to add a tendril or a flower, and he liked the butterflies such as Sophie painted. And as old Cheron had sharp eyes, but was very deaf, and his daughter worked in the deep recess by a window which was in itself like a small studio, the young page could sit on a low stool near her, and looked less at her hands than at her face. My godmother must, in her youth, have been very lovely, for even now she is like a picture; and I must say, Antoine Watteau, when she walks through the room in her costly yellow silk dress with her powdered locks which fall on her shoulders, when the large pomegranate flower hangs behind her left ear, with her white neck and throat bare, around which is fastened the black velvet ribbon to which the charm is attached, she seems to float by so lightly and yet so proudly as if in a cloud, I always think that amongst the youngest and prettiest women, she looks the youngest and prettiest of all. Therefore it was no wonder that in the days gone by, the young page (he was a marquis' son) stopped off his seat at her small feet and whispered to her about love and truth (old Claude was scolding a scholar behind his curtain), and begged the mistress of his thoughts to accept his heart and life.

"Can you guess what Sophie Cheron answered, with a merry laugh? 'Not until you have remained faithful to me for thirty years will I believe your words and accept your offer.' My godmother has told me that pages are not noted for their constancy," added Cadette, very seriously. "But fancy, the handsome Robert de la Haye disappeared, after her answer, out of Paris, and sent her as a farewell, the charm which I have broken, and a small piece of paper upon which was written, 'Au revoir in thirty years.' And from that time until now, she has heard nothing of him. I believe the thirty years are over, but I do not like to ask my godmother. I know full well," added the girl very seriously, "that she is sorry she sent him away, and that she has never cared for anyone else."

"The page was wise; it would have been difficult for him to remain faithful in Paris, but abroad it is different; does not Sophie Cheron understand that?" remarked Antoine, smiling.

"I shall only forgive such a nasty speech from you, if you make haste and paint the charm, detestable joker. And, now, farewell; if you keep your word, I shall keep mine."

He held the little hand which she gave him a moment in his and whispered, "Cadette, you do not know how happy you make me, when you are so kind to me." Blushing, and her heart beating violently, she escaped. It was high time, Mdlle. Cheron had already rung her bell. But how quickly the time had passed away!

The artist was ranked, in fact, amongst the richest and most renowned women in Paris. People treated her like a princess, and her former noble patronesses now visited her willingly as her guests. The flower of renown and wealth had sprung up quickly in her case. Her delicate and original painting had become the fashion after Henrietta, Duchess of Orleans, shortly before her death, had used a fan painted by Sophie Cheron. The ladies of the Court and of the aristocracy, as well as their admirers, ordered for presents, paintings on enamel from her, and her father's studio was never free from visitors. It also sometimes happened that somebody wished for a motto, or a well-turned compliment to be put upon his present. Sophie could write verses. About the same time she tried her hand at miniature painting, and succeeded so well, that she soon had more orders than she could attend to. In her twenty-sixth year, she was elected (at the suggestion of the celebrated Charles Lebrun) a member of the Academie des Beaux Arts in Paris—an honor never before bestowed upon so young a lady. Cheron then bought a large house and began to live in grand style. She could now afford to enjoy the "dolce far niente," and only executed such orders as pleased her, and enjoyed life like all the other women at that time. Her reputation remained spotless and her heart untouched. Her poetry and prose soon excited as much interest as her painting, and her fame as a poetess had spread far and wide. Some years before, the Academy at Padua had elected her a member under the name of Erato. She refused all offers of marriage, and said she would never leave her father.

She was no longer young when the old painter closed his eyes forever on the things of this world; but there are some who in heart and feelings remain ever young, and to this number belonged Sophie Cheron.

She was surrounded and feted by the elite of Parisian society; her house was the rendezvous of the learned and the talented; poets and musicians met there, as well as the nobility, and her garden parties were much sought after. But not only did the rich and happy crowd to Sophie Cheron's, the poor and unfortunate turned to her, sure of receiving aid and consolation. No one ever gave help more joyfully, or advised better than she did. The amiable Abbe Bosquillon had called her "the angel," and that remained her nickname.

Antoine Watteau brought back the locket only about an hour before the garden party was to begin. Cadette was trembling with fear and anxiety, lest he should bring it too late. She could scarcely look at it, there was no time; she fastened it with trembling hands on to the velvet ribbon, and tied it around her godmother's neck. Antoine Watteau, after having been regaled with plenty of good things, was hidden in the bushes not far from the large lime tree. At last his long-cherished and secret wish was realized. How anxiously he had dreamed of such a treat. What a charming place, in the blooming thicket, had Cadette directed him to, behind the yew-tree hedge. There he remained quite motionless, and the whole world disappeared; only one thing absorbed his thought—a large shady garden, with splashing fountains, old trees and dark green grass plots and charming forms that enlivened the garden and the lawns. It was not till long after dark, and when the gardens had been lighted up, that Antoine Watteau slipped, enchanted, out of his hiding place, and went into the house; he had forgotten to eat or drink. Cadette ran towards him in the dimly lighted hall, carrying a dish of fruit. He seized her hand absently and excitedly. "Thanks, thanks," she heard him whisper, and then he was gone, "How foolish to be in such a hurry," murmured the young girl half sad and half angry, "I could have spared him plenty of time. . . ." It was long after midnight when Cadette, with sleepy eyes, undid her mistress's hair. Sophie Cheron sat in her dressing-gown, and leant back fatigued in her arm chair. She drew dreamily the ribbon of her locket off her neck. Cadette had not thought of unfastening the bow, the locket slipped into Sophie's hand. Her beautiful eyes, gazed for a moment at her favorite jewel—she cried out with astonishment, then she burst out laughing, and at last exclaimed, hurriedly, "but where is the enchanter who has painted this wonderful cherub for me? What has happened to my charm? tell me all Cadette!" The locket shone in the candle-light; the trembling Cadette stared at it. Such then were Antoine Watteau's angels! A lovely little Cupid sat in all his irresistible, roguish beauty upon a cloud, and held a silver trumpet to his mouth. Whom did he intend to summon?

The young girl, sobbing, confessed all to her godmother. But wonderful to relate Mdlle. Cheron was not angry. She kissed the weeping maiden, and sent her to bed, telling her that she must bring the Cupid-painter to her on the following day. That little Cupid decided Watteau's fate. The renowned and admired Sophie Cheron took the young painter under her protection, and introduced him into society, where he soon became a general favorite.

He painted the fashionable world of Paris of that time in all its beauty and thoughtlessness, and was present at all the parties of pleasure there given to while away the time.

But was the painter of all these fetes happy? He was the son of a poor lace-seller in Valenciennes, who, since his childhood, had longed to be amidst such pleasures. Did he ever find love and truth equal to what had shone upon him during his residence as scholar with Claude Gillot, and which he had thrown aside so lightly in the days of his prosperity? Watteau's biographers relate that he left Paris sick and tired to go to England, and when there he was tormented by a longing to return to his enchantress, Paris. But when he went back he became possessed with a still greater longing to visit Italy. That wish remained unfulfilled. Whatteau died at thirty years of age in Negent. No heavy silk dresses appeared at his bedside, no joyful voices, no waving of fans struck upon his ear, but a soft hand smoothed his pillow, gentle, faithful eyes looked at him forgivingly, a soft voice prayed for him in his last moments, a sister of mercy, once the joyful little Cadette, nursed the dying man.

And as regards the charm!

The little Cupid's silver trumpet seemed to have wrought wonders. The former page who had disappeared so mysteriously came back again suddenly (after all sorts of adventures, and a long imprisonment), as a great hero, and still more wonderful to relate, as a true lover. Sophie Cheron became in her fifty-ninth year Madame de la Haye, and no one seemed astonished at it.

Where the rococo locket went after the death of Sophie Cheron, in 1711, perhaps might be revealed to us by the little Cupid upon the rose-colored enamel if he had the gift of speech.

The novel union of two exquisite talents will always make Cheron an ornament to France. The charms of her brush equalled the excellence of her pen.

VINTAGE TIME IN GERMANY.

BERTHA A. WINKLER.

It was on the first day of October when our travels brought us into the famous wine regions of Germany where we intended to sojourn for a few days in order to witness, what our portly landlord called, the "Kelter opening," which, judging from the lively gesticulation accompanying his description of that important event, must certainly be a rousing and curious sight. It was therefore not strange that I rose the next morning with more alacrity than usual at the call of the maid and took a peep, full of expectation, up and down the village road which, in spite of the early hour, was already groaning under the heavy wheels of clumsy carts.

An unusual bustle, a strange, subdued noise pervaded the misty air about me. The whole village was astir and active, yet in such a quiet, mysterious manner that it reminded me more of an army preparing for a sudden attack upon the unsuspecting enemy, than a quiet, peaceful village about to gather its annual harvest of grapes. Women, in short gingham petticoats, were passing to and fro with all sizes of tubs and buckets on their heads. The younger folks were standing in groups, conversing and flourishing their grape-cutters or "habbe" (a short knife bent in the shape of a sickle). While others stood impatiently, cracking their whips over the backs of their ox-teams who were yoked and ready for service. Evidently something was being waited for, and I was about to turn to the inn-keeper and ascertain the reason of the delay when my attention was attracted by the tinkling of a bell, and looking again I saw a man wearing a cocked-hat and a blue coat ornamented with immense brass buttons, striding up the road in all the dignity of his office. Halting at the inn, while he gave his bell a few more vigorous shakes, which soon collected a goodly crowd, he issued the following proclamation: "The inhabitants of E—— are hereby notified that the Kelter will be opened this morning at six o'clock. All those whose tanks are secured there will report at once. By order of the Herr Schult-heis."

This was the signal for starting. He had scarcely finished when a suppressed "Vivat!" burst from the lips of the laughing, noisy standers. The whole village rushed now in the direction of the Kelter, and in less than five minutes the hollow rumbling of empty tanks sounded like thunder on my ears. This roused my sleeping traveling-companion, who hastily dressed herself and joined me just in time to see the first and largest tank, which measured about eight feet in diameter, drawn past the inn, followed by a long train of smaller ones, all decorated with gay ribbons, flowers, and wreaths of evergreens, amidst the lusty shouts of "Hue! Hott!" from the brawny drivers, and songs and laughter from the villagers, as their happy, smiling faces were turned to us with a look of curiosity not unmixed with conscious pride at their own festive appearance. The novelty of the scene, the gay tumult and excitement were contagious, and we, unable to resist the influences of the general excitement, waved our handkerchiefs to the passing caravan. A double "Vivat!" greeted this unexpected salute from the strangers, and one handsome young German, not to be out-done in courtesy, gathered a handful of flowers which decorated his tank and threw it up to our window, amidst the shouts and clappings of his comrades.

In the afternoon we made our way up to the "wein-bergs," from whence we had a good view of the quiet and now almost deserted village, nestling below amidst a miniature forest of fruit trees between the vine-clad hills which stretched themselves in a small mountain chain around the rear of the valley, while further away the white stubble-fields, dotted here and there with patches of green clover and yellow corn, made the checkered landscape look like an immense patch-work in the far distance. Below, we saw peace and tranquility in the quiet village, with

its quaint, old-fashioned dwellings and the sleeping valley with its murmuring brook lazily gliding through its everchanging labyrinth with falling autumn leaves dancing noiselessly on its surface. Above and around all was life and bustle. The whole region swarmed with busy vintagers whose brightly-colored costumes formed a lively contrast to the somber, autumnal aspect of the surrounding country as they darted to and fro among the now half-dismantled vines, filling the air with merry words and happy laughter while their nimble fingers were deftly cutting the purple clusters of grapes from the vines. Lusty shouts, gay carols and snatches of popular ballads rose through the vapor of the autumnal landscape while, from the opposite hills, the air came freighted with the echo of a chorus of sonorous voices, singing a national song with such strength and harmony that it thrilled our hearts with emotion and pleasure and caused a momentary hush of chatter among the busy workers around us.

We could not help but notice the sweet, harmonious blending of labor and pleasure, the cheerful industry in the midst of song and laughter. Little eight-year-old children stood cutting the grapes with the practical, business-like air of a grown person. Young, rosy-cheeked girls balanced the heavy tubs full of the luscious berry upon their heads with an ease and grace worthy of a finished gymnast, while the male portion carried their indispensable "Buddens"—(a deep wooden vessel in the shape of a half barrel cut apart lengthwise and secured to the shoulders with leather straps or twisted willows).

It is strange that, in this secluded village where the cruel, exacting customs of the outside world are usually so little observed, it should be considered vulgar and unwomanly for any female to carry one of these "Buddons,"—which are handled with so much more ease and comfort than the heavy, unwieldy tubs,—while at the same time it is nothing unusual to see a woman plow the field or push a wheel-barrow!

When the sun began to decline in the west and the vintagers, with their tanks and barrels full of half-pressed grapes, formed themselves again into a long train down to the village, we descended the hills, which were still ringing with the cheers of a few stragglers, and preceded the long caravan of carts to take a view of the Kelter, before the busy harvesters arrived. The Kelter is a large, square, wooden building, similar to an American market-house in style of architecture. The stalls or apartments containing the tanks are numbered and ranged on either side; in the center is a large wine press, where each of the villagers takes his turn. The Kelter is opened on the first or second day of October and closed for the rest of the year at the end of the month. The season of grape-gathering seldom lasts longer than three weeks, at the end of which time there is a grand festival, called "Kirby," where the wine-merchants from the city, after closing their bargains, are feasted with new wine and the young folks have a grand hop at the inn.

QUIET PEOPLE.

THE misgovernment of the world is carried on with such an amount of talk that one has seldom time to think how little would suffice. Half-a-dozen well-chosen words would generally be better than whole conferences and debates. Both wise and foolish people have broken much silence in praising it. The silent man is often enabled, by the value attached to his rare utterances, to say more by his silence than a voluble talker by a string of phrases. There is a kind of silence which is the reverse of talk, and is in itself eloquent. A prisoner who reserves his defence, a witness who refuses to answer a question, a man who holds his tongue when his character is assailed—in short, all the cases in which "silence gives consent" are rather silence as the negation of speech than as a positive quantity. It is quite easy to imagine loquacity in a deaf mute. He may not have power to utter a sound, yet, in the strict sense, he is not perhaps a silent person. And silence kept on purpose to express, by its very existence, an emotion of the mind, is only a substitution of signs for speech. Such is the reticence displayed by the well-known epitaph on a tombstone in Fulham churchyard, where, after the name, age and date of death of the lady buried below, three words only are added by way of epitaph—"Silence is best." The estimation of the deceased by her surviving relations could not be more fully expressed had the whole stone been covered. When a character is to be given to a drunken or dishonest servant, the omission of the words honest and sober is sufficient. But this is not the silence of quiet people. Too often they resemble rather the chimpanzee than the parrot, and are not talkative because talk may involve them in further exertion. But it is not easy to pry into their motives of action, or rather of inaction. The Ulster folk have a proverb, "Nobody can tell what is in the pot when the lid is on." It is not the most unselfish people who talk least about themselves. To some the facts which relate to their personal history are too serious for words.

Unspeakable are the emotions of silent people; a sense of personal dignity or shame keeps them quiet; but to most of them is vouchsafed a single confidential friend, into whose ear all the pent-up feelings are poured from time to time.

This is especially the case with quiet girls. What they say in their moments of confidence we cannot pretend to know. Whether they are really quiet or only shy is equally beyond the superficial observer. That they are not found to impede the pleasant flow of soul in ordinary society is because they are eminently good listeners, and do not yawn at the utmost commonplaces. That another should commit himself to speech, with or without anything to say, is enough to interest them. They are thought sympathetic, and often draw forth the tale of woe long hidden. Men begin by telling them of other loves, and often end by loving them for themselves. In this they have advantage over the more gushing sister. They take no notice of a foolish speech, and a man imagines he is safe in their hands. He can say things to them which, said to any one else, might have serious consequences. A quiet cousin is thus often a great blessing to a man. He can talk a matter out as if with himself, and imagine afterwards that he has had counsel upon it. The quiet girl hears him with outward sympathy, agrees with all his views, and, when asked to help him to a decision, gives her casting vote in favor of the course he already prefers. He finds after a time that her quiet receptiveness is grateful to him; and, when she has seen him safe through an engagement or two, and half-a-dozen flirtations more or less serious, he suddenly finds out, or at least tells her, that he has really been in love with her only all the time. Sometimes this happy result is brought about by scheming, and it is the great drawback of quietness that duplicity is so often attributed to it. The quiet girl of the family regulates the autumn tour; she silently directs its goings to the place where her bosom friend, male or female, is to be met with, and she will bury her sisters in a northern moor or bake them at Brighton with equal and unruffled composure. True, she never asks to go anywhere in particular; but at odd intervals she hazards a remark which suggests the place, and now and then reads out a paragraph from a letter or newspaper in which its advantages are set forth. What she does say is listened to by the family, for she is always sure of an audience for her rare utterances, and gets a reputation for good sense which she does not always deserve. She is never in scrapes, or, if she is, keeps them to herself. Her allowance is never overdrawn, or, if it is, no one hears her grumble that she cannot make ends meet. There seems to be a method in her doings to which people instinctively yield, and she gets her own way, not so much because she tries to get it, as because nobody thinks of opposing her. Like the flies whose feet are provided with soft pads, so that you do not feel them when they alight on you, her influence works unnoticed, and everything seems ordered for her rather than by her. She almost monopolizes the attention of the lady's-maid she is supposed to share with her sisters, and can always manage a cup of tea in her room or breakfast in bed. She can flirt, on occasion, in a way no frivolous girl dares to attempt, but she never writes a compromising letter, and has a most convenient want of memory. She accepts presents which her sisters would have to refuse, and keeps them laid by in cotton wool to look at during the hour she is doing her back hair and saying her prayers. She retires gracefully in favor of the other girls, as if willing to let them shine, and gets her reward by the approbation of the old people of the party.

Quiet men find her agreeable, and wonder why she is said to be silent, but this is chiefly because she does not bore them by insisting on answers to her questions. When she develops into a wife, for she always marries at least once, she gets her own way in everything. Her husband probably chose her because he thought it would turn out differently, and finds when too late that he could not possibly have made a more complete mistake. Children are always fond of her; sons respect, if they do not greatly love quiet mothers, for they have never heard them talk nonsense. Servants never give them short answers, as their words are few and decisive, and the poor people think them dignified and mines of hidden wisdom. In fact, they go through the world under a kind of false pretense; they get credit for great depth of feeling, and it is for some reason thought well worth while to win their love. Only the experienced man estimates them at their right value, and admires the merry little sister with the sharp tongue, the pleasant smile, and as he knows well, a warmer heart and truer character than underlie the staid demeanor of the quiet girl.

Quietness is sometimes a sign of bodily health. The nervous man who is always stirring is seldom strong. But when a man is thoroughly wrapped up in himself and his own importance, perfectly satisfied with his position and prospects, the cut of his clothes, the length of his whiskers, the attenuation of his umbrella, and luster of his hat, the chances are that he is very quiet. Such men are habitually well dressed; but as they get on in life they cling to old fashions. They are not considerate for others, yet they give very little trouble. They exact the utmost service, but make no fuss about it. They are painfully regular and punctual, but never seem put out by other people's want of order. They are bores at a dinner party, wet blankets at a picnic, mere sticks at a ball; but excellent as officers, admirable parsons, and much sought after by match-making mothers. It is they who carry off the heiresses; who always save money; who are never in debt or difficulty, as other men are; who are regular in their devotions, and invaluable on committee, where they always get their own way without trouble or fuss. They habitually wait till every one else has spoken, and then make the single remark which concludes the matter, and which seems as if it had risen to the surface, like cream, of itself.—*Fortnightly Review.*

HOW TO LEARN TO SWIM.

MAN, for the most part, must learn to swim; and here is the recipe. It must be understood that we are teaching a man come to years of discretion. First, work up theoretically and practically (as far as may be out of the water) the position of the body in swimming, and the rhythmical extension and adduction of the legs and arms. Then boldly walk into the sea, when it is rather calm, up to the chin, turn to the shore, and fall forward on the chest, letting the arms cut the water before the body, and practice the motions, now familiar to the mind from the treatise. Never mind swallowing a little water! Persevere in this for several days in succession, and then, if possible, get a swimmer to support your chest for a minute or two. Or, better still, as man is nearly of the same specific gravity as water, the addition of a very few pounds of cork will make him float. Get several pieces of cork, therefore, and fasten them to loops in which the arms can be inserted, and with the addition of these you will find, when the "stroke" is once familiar, that you will easily float, and what is more, make progression through the water. Stick to this plan for a few more days, and then try your own unaided powers again, and you will be astonished to find that you can swim. In this way, without any swimming-master or parade of any kind, swimming (we speak from personal experience) is easily learnt, and then what a treat, and what a charming mode of gaining exercise, does a bath in the sea become!

Instead of being a shivering duty, looked forward to as a necessary part of the *poojah* due to a watering-place, as an Anglo-Indian would say, the daily bath is eagerly welcomed, and the whole system invigorated and braced up by it. For the swimmer leaves the water with every muscle and limb aching with his exertions, and the whole body pervaded by a healthy glow of which he will feel the beneficial effects throughout the day. When once the stroke is familiar to a man—comes, as it were, by instinct to him (as it surely will if the above *modus discendi* be persevered in), all that is needful is to set one's self daily the task of a stroke or two more, and soon the learner will find himself able to swim any reasonable distance, not now near the side, but boldly dashing out among the waves. Thus, if he finds he can only struggle on for six strokes to-day before his face sinks and he gets a ducking, to-morrow let him set himself the duty of struggling on through seven strokes, eight strokes next day, and so on, never being satisfied with his efforts until he has succeeded in performing his daily number of strokes. In this way a visit to the sea becomes a happiness to be looked back upon ever after in a man's life with pleasure. How much better is it thus to have acquired the mastery over a strange element than to have lounged up and down the beach for many mornings, listening to Italian organ-grinders and smoking innumerable cigars.—*Cassell's Family Magazine.*

RECENT LITERATURE.

His Dear Little Wife. Philadelphia, Pa.: J. M. Stoddart & Co. Price 25 cents.

A tale more sad, tender and true, we have never read. It almost passes belief that a man is the author of it, for it would seem as though only a woman who had suffered could so faithfully portray the misery of the "Dear Little Wife." So long as a man provides for his family and refrains from using any actual violence towards his wife, he is esteemed a good husband; and yet all the while he may be crucifying his wife by his self-assertion and his thoughtlessness. The fatal doctrine that the wife is to lose her identity in, and to be absorbed by the husband, develops selfishness and tyranny in the man, and is the occasion of bitter unhappiness to woman. The author has taken the "subjection" theory for his text, and his treatment of the subject shows him to be a keen observer, and to be possessed of a deep knowledge of womanhood, its nature and needs. If the average man could but be induced to read the book, and profit by the lessons it teaches, many a wife would have reason to bless the author for having written it.

Savell's Expiation. Translated from the French of Henry Greville, by MARY NEAL SHERWOOD. Phila.: T. B. Peterson & Bros. Paper, 50 cents; cloth, $1.

THE author's reputation as a powerful and original writer is rapidly becoming an accomplished fact with American readers. And we have now under notice the book which has done more towards establishing her reputation abroad than any other. For strength, variety and a marked dramatic interest, it takes precedence of all her other works, and ranks among the first of modern novels. The characters are boldly and powerfully drawn, and the incidents are varied and intensely interesting, while the underlying strata of pathos and tenderness soften the effect of the rugged individuality of the characters upon whom the plot rests. It is a story of the time of Russian serfdom, and though there are scenes of painful interest vividly depicted, there is nothing of the sensational and nothing overdrawn. The author's forte is in her appreciation, analysis and delineation of character and remarkably realistic descriptions. The language is always refined and elegant—the translator having done the author justice, and altogether the book is thoroughly enjoyable.

Six to One. A Nantucket Idyl. New York: G. P. Putnam's Sons. Cloth, 75 cts; Paper, 40 cts.

THIS is a pleasant little story of an editor's summer vacation at Nantucket where he is lionized by six young ladies of whom he enjoys complete monopoly. The peculiar circumstances render everything like a plot out of the question and there is even a dearth of adventure until the hero of the "Idyl" wrests his favorite naiad from the clammy embrace of Neptune who sought to win her for his own. After this the two become satisfied the other five girls are not absolutely necessary to their existence, and poetic justice is accomplished.

LITTELL'S LIVING AGE.—Littell's Living Age for the week ending September 14th, contains a very interesting article, entitled The Four Last Sultans, translated and abridged for the magazine, from advanced sheets of a work by Count E. de Keratry, ex-diplomatist at Constantinople. The number also contains the Baptismal Creed of the Early Roman Church, Contemporary Review; The Trial of Two Quakers in the Time of Oliver Cromwell, from original documents by A. H. A. Hamilton, Frazer's Magazine; The First Edinburgh Reviewers, Cornhill Magazine; The Bewilderments of Science, Spectator; Thibet, Nature; The Drawbacks of the Intellectual Life, Spectator; instalments of two serials, one by Miss Keary, author of Castle Daly, Oldbury, etc.; the other by Mrs. Oliphant, and both published from the authors' advance sheets; together with the usual choice poetry, etc.

BRIC-A-BRAC.

THE TALE OF TEN THERMOMETERS.

Ten little 'mometers roosting on the "Line,"
One fell and broke its "neck"—then there were nine.

Nine little 'mometers scoring hundred 'n eight.
One "its biler bust"—in passing old "Death Rate."

Eight little 'mometers sending folks to heaven,
One had a sunstroke—counted out by eight to seven.

Seven little 'mometers all as light as bricks,
One took too much frigid ice—leaving only six.

Six little 'mometers trying hard to thrive,
One turned up his tiny toes—you couldn't count but five.

Five little 'mometers, oh, to hear 'em roar!
One broke its vitrous case—now hung only four.

Four little 'mometers seeking shady spa,
One its "innards" did congest—thermometric cholera.

Three little 'mometers looking deuced blue,
One it swallowed mercury—and "shook" the other two.

Two little 'mometers warming up the sun,
Both started for St. Louis—I've only heard of one.

One little 'mometer dressed en dishabille,
It's got a fan and tub of ice—but is very, very ill.

[*Cincinnati Commercial.*

NOTHING LIKE TRUST.—Spurgeon says: "There is nothing in the world that impresses a man so much as trust. Some years ago I was mastered by a dog in that way. I own, in fact, that I was beaten hollow, and he was a conqueror over me. He came into my garden, and he had no business there. Thinking that he would not improve my flower-bed, I walked along quietly and threw my stick at him, and thus advised him to go somewhere else. What did that dog do? He stopped, picked up the stick, wagged his tail, and came running to me with it, and laid the stick down at my feet. I felt ashamed of having thrown my stick, and the dog was told he might come round the garden when he liked. How could I do otherwise?"

THE LIFE OF THE ROSE.

[From the French of M. J. Resseguir.]

Rose
Fair
There
Grows,
To whose
Lot
What
Close?
Sweet;
Fleet;
Chill
Breeze
Will
Seize!

THE poet Southey mentions that in days gone by, the Mayors of Leicester used to be chosen by a sow. The candidates sat in a semi-circle, each with his hat full of beans in his lap, and he was elected Mayor from whose hat the sow ate first.

A CALCULATION has been made and confirmed by several distinguished engineers, to whom it was submitted, showing that the population of the whole world, fourteen hundred millions, could find standing room on the Isle of Wight.

"The sandal wood perfumes, when riven,
The axe that laid it low.
Let him who hopes to be forgiven
Forgive and bless his foe."

A DISTINCTION WITH AN INDIFFERENCE.—"Why," asks the Scientific American, "should not a child be taught to write with both hands indifferently?" We don't know, unless it be that indifferent writing is hardly looked upon as a desirable accomplishment. We could point out quite a number of people who write so indifferently with one hand that it is a matter for gratulation that they cannot use both.

"DON'T GIVE IT AWAY."

From the simplest flowers by the wayside,
Fair wisdom may cull a bouquet;
A street-phrase may oft point a moral;
There's sense in—"Don't Give it Away."

If you hear of a choice bit of scandal,
Be it "spicy" or true as it may,
Don't eagerly hurry to spread it,
Do better—"Don't Give it Away."

When a gossip persistently bores you,
Your fellows or friends to betray,
Be polite as you can, but remember
Be firm, and—"Don't Give it Away."

When a confidence rests in your keeping—
When a friend to your ear doth convey
Some secret he trusts to your honor,
Take care you—"Don't Give it Away."

[*Stamford Advocate.*

THE old-fashioned custom, still existing in some parts of the country, of crying out "God bless you!" when any one sneezes, is not confined to England. In Russia, if the emperor happens to sneeze in any public place, the whole assembly cries out to wish him good luck. The origin of the custom is lost in obscurity, although it has been attributed to Pope Gregory the Great, who died in 604; but numerous allusions in classical authors, and the prevalence of similar salutations among savage tribes, prove that this idea is without foundation. There is also a tale which may possess some truth, that in the days when the plague was common, a violent sneeze marked the crisis of the disease, to which the bystanders then wished a happy termination. Among the Highlanders and Irish, it was believed that any one sneezing thrice without being thus saluted, became subject to the power of the fairies.

FATHER TAYLOR, while lecturing on temperance, was hissed by one of his hearers, a notorious drunkard. Taylor stopped, pointed to the offender, and said, "There's a red nose got into hot writer, don't you hear it hiss?"

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

OLD GRANLEY.

OLD GRANLEY swore by all the leaves
That were upon the tree—tree—
He'd do more work in one short day
Than his wife could do in three—three—
Mrs. Granley she came in, she says,
"You shall have trouble now—now—
For you shall do the work in the house,
And I'll go follow the plow—plow—
But you must milk the mooley cow
For fear she will go dry—dry,
And you must feed the little pig
Which is within the sty—sty,
And you must put the cream in the churn
Which is within the frame—frame,
And you must see to the fat in the pot
That it don't all go in the flame—flame;
And you must feed the speckled hen
For fear she'll lay astray—stray,
And you must reel the spool of yarn
That I spun yesterday—day."
Mrs. Granley took the whip in her hand
To go and follow the plow—plow.
Old Granley took the pail in his hand
To milk the mooley cow—cow.
The mooley cow—she kicked—she raved,
She rumbled with her nose—nose,
She kicked Old Granley on the shin
Till the blood ran down to his toes—toes.
He went to feed the little pig
Which was within the sty—sty,
He hit his head against a beam
And his hair began to fly—fly.
He went to watch the speckled hen
For fear she'd lay astray—stray;
And he forgot the spool of yarn
His wife spun yesterday—day.
He went to put the cream in the churn
Which was within the frame—frame,
But he forgot the fat in the pot,
And it all went into the flame—flame;
He looked east—he looked west,
He looked to the sun—sun.
He thought it was the longest day,
And his wife would never come—come.
Mrs. Granley, she came in,
And she looked sad—sad,
She wheeled herself around about,
And said she was glad—glad.
And then he swore by all the leaves
That were upon the tree—tree
His wife could do more work in a day
Than he could do in three—three.

[Boston Woman's Journal.

A LETTER TO YOUNG MOTHERS.

MRS. ELIZABETH BOYNTON HARBERT.

"EXPERIENCE is the best teacher," we are told, hence this morning I present you with a leaf from the letter of a friend, written on her first anniversary: a short recital of her own experience:

When we were first married I was not altogether perfectly, ecstatically happy. Of course you know that George could not be other than thoughtful and kind, and when I could have his society I was contented and happy; but, alas, I scarcely saw him. Previous to our marriage we always passed two evenings of each week together. We learned new music, read new books, and I thought had laid the foundation for friendship as well as love. But scarcely were we settled in our cottage when that great anaconda of business, money, business, came coiling in, and every hour for reading, every moment for music, were swallowed up, and one morning, after George had almost strangled himself with a hot cup of coffee, had flashed his mustache across my cheek and called it a good-by kiss, and then reopened the front door to call back, "Don't wait dinner for me, pet—I have a business engagement that will detain me," it flashed through my mind that my life-work was keeping a boarding-house for one, and that boarder too busy to even take time to compliment his landlady. The honest fact is, I do not believe I was a very fascinating landlady, either. Why? Unfortunately household work was very distasteful to me; in vain did I try, and try earnestly, to overcome it, and ignore the fact, but three times each day I was brought face to face with the stubborn, unyielding fact that washing greasy dishes was an abomination to me.

The atmosphere of the kitchen when vegetables were boiling was almost unendurable. I was awkward and extravagant. I soiled my clothes, burned my fingers, worked from morning till night, accomplishing little, and was often untidy and cross when my husband returned at night. Added to this, although I worked hard, my husband did not realize that I earned anything. He never gave me a dollar unless I asked for it. I felt like a beggar, and he never dreamed that I felt so.

What was the trouble? I was endeavoring to perform work that was not only especially distasteful to me, but work for which I had never been prepared by instruction or experience. Taking a view of the situation, I soliloquized as follows: "Caroline, you are certainly good for something in the world, but you are certainly not a success as a housekeeper; what are you good for? What have you been trained to do?"

Immediately there flashed before me the money and time expended upon my musical education. Evidently if I was fitted to fill any niche it was that of a music teacher. Music I enjoyed. As a result, when George returned that night he received the announcement that I had secured several music scholars; that I had engaged a poor girl that was killing herself sewing to do my dish-washing. She disliked sewing, and was living in a garret. I could give her a good home, thus rendering two people comfortable.

My husband at first seriously opposed my plan. He insisted that it would be very humiliating to him to have his wife give music lessons. "What will people think if I am not able to take care of my wife?"

"My dear, you are not able to take care of me now, and I am as strong and as able to assist in earning our home as you. As our business is now arranged you have no time for reading for culture, for home life, while I am compelled to devote almost all of my time to very distasteful labor.

By this new arrangement I will be obliged to give but twenty-four hours per week to business, and the family purse will be helped and the home better managed, and we shall have more hours together.' Of course I carried my point, and we have been happier than ever before."

And this letter is only typical of many others from which I might quote.

From babyhood girls are wronged in the suppression of their natural tastes and preferences. The evident restlessness of American women to-day is the natural recoil from this despotism of repression.

The fond father, watching for the first faint indication of genius in his boy, observes that he has a preference for machinery, and the house is filled with boxes of tools, toy engines, and wind-mills; while speculation as to his fortune is one of the most interesting subjects of family conversation—but what if his tiny sister evinces a special talent for millinery? Do we hear any fond anticipations of the time when she is to become an artistic milliner? And yet is it n t just as honorable to combine flowers, fruits, feathers, laces, in pleasing effects as to combine paints?

Or what if the daughter should evince skill in designing; if her artistic soul harrowed by the frightful blending of colors in the carpet, the grotesque figure of the wall-paper, should design something better? Would she receive the same encouragement as her brother? Oh! mothers, seated by your sweet girl children, watching with tenderest mother love the first faint indications of genius, taste, or individuality, as you value the possibilities of life, hesitate ere you attempt to crowd that little soul into the straight-jacket of custom and prejudice: God, with infinite wisdom, bestows upon your child a genius for practical art, and the world needs art—but custom produces the straight-jacket and says: "God has made a mistake; you are to wash dishes and sweep and dust."

God sends the gift of song, and bids this girl-child write. Write earnest, pleading, womanly words, mother words for the great sin-sick world. But custom hints, "God mistook you for a boy. He meant you should only live for love; touch literature, and being a woman, you may fail of love; bury your talent, buy a broom, let not an inkstand mar your feminine hand; so shall you win a husband."

Yet again, there comes surging through another soul messages of love and hope and peace for humanity. "Think what the Christ hath done for you, will ye not confess Him?" The woman's heart beats back a responsive, "Yea, Lord," but the Christian Church writes over her pulpits, "Sacred to men."

Because of these things, little mothers, because of these tyrannies of custom, I plead with you to diligently seek for the light.—*Inter-Ocean.*

6340

DESCRIPTION OF CUTS.

IN reply to a number of inquiries for the latest designs for overskirts or dresses, we give two models 6340 and 6341. The first named is a suitable pattern for a second best dress. Made of woolen goods and trimmed with braid or pipings, nothing could possibly be devised which would be neater. No 6041 on the contrary is rather too dressy for common wear. The front of this polonaise falls in a neat outline over the skirt, the center of which is formed of an extension left upon the front edge of the left side front, from the waist line to the bottom of the garment. At its side-edge the extension is cut in square blocks that are piped with silk and buttoned to the adjoining edge of the right side front to a short distance above the lower edge, while at its top it is confined to a band by means of which it is properly adjusted. The printed directions which accompany this (as every other pattern) give full details as to how the pattern is to be put together and the polonaise made. The price of either of these patterns is 30c. If any ladies desire patterns of any special garment either for themselves or their children, if they will drop me a postal card stating what they would like, I will either publish a cut of same or write them describing it.

FAITH RIPLEY.

EUROPE'S RETURN FOR THE AMERICAN POTATO BUG.

THE CARPET PEST.

THE *Anthrenus Scorphulariæ*, an insect well-known in Europe for its destructiveness, made its first appearance in this country about two years ago, to the consternation of the few house-keepers whose possessions it preyed upon, and now that it threatens to extend the sphere of its operations and become a national nuisance, it may not be amiss to acquaint the RURAL readers with a few of the methods employed for destroying it.

The ordinary moth-remedies—camphor, turpentine, tobacco—are utterly without effect when used against these creatures. They show a special liking for carpets, furs and woolen and cloth goods of every description, and the question has been how to destroy the insect without injury to the fabric. Prof. Lintner recommends (in the case of carpets) that kerosene oil be poured in the crevices of the floor and that all places of retreat be filled with cotton saturated with oil. Prof. Hazen, Professor of Zoology at Cambridge says: I would recommend carbolic soap as a preventive.

It should be cut up in thin slices and put in between the carpet and the paper-wadding. It smells so badly that even the honest carpet-bug cannot stand it, and is forced to put distance between itself and the soap. Carbolic soap does not destroy them, but drives them away. Then, every morning the windows should be carefully inspected, and every beetle be destroyed. After the carpets have been taken up and carefully beaten, the floor should be washed with hot water and very strong soft soap. That is something they cannot stand. It kills them. It would be better if the washing is repeated two days after the first application of soap and water. It is unnecessary to add that the carpet should not be subjected to washing, as it would be spoiled by the operation. The cracks in the floor should be carefully filled with some destructive and preventive agent. Kerosene will kill them if you can make it convenient to camp out until the odor arising from it has died out. In the use of kerosene, benzine or kindred liquids, the insurance companies would have something to say. I would never counsel anyone to adopt any of these remedies."

The Boston Journal mentions another remedy: "From the description given of this bug or insect, it is the same that invaded this city some two years since, and from whose ravages among the costly furniture, choice carpets, valuable furs, and fine fabrics of many of our most opulent citizens, many thousands of dollars were lost. No effort on the part of our people could drive them from our households, until the introduction of the victorious Hemiptera Powders, which at once exterminated the pest.

"These powders were imported by one of our citizens, who, while on a visit to London, learned that this antidote had been prepared by Mr. C. S. Derby, an eminent chemist, for the especial extermination of this pest, which for several years had ravaged almost every prominent town throughout England, successfully baffling every attempt at extermination until the introduction of this effective antidote. These powders, which are sure death to all household vermin of every kind of species which infest our houses, are perfectly harmless to furs, woollens, flannels or fabrics of every kind, as well as to carpets or choice furniture."

A WOMAN'S PLAN FOR MAKING HOGS "KEEPERS AT HOME."

My neighbor's hogs!
Dod rot their bones.—

EDITOR OF RURAL:—I would like to shake hands with the author of Old Grimes, be it man or woman. If a person can get up in the morning and quietly view the destruction done by a dozen hogs he has more patience than JOB, for among all his tribulations there is not one word said in regard to hogs. I, being a woman, was simply furious, when I saw at least a half acre of my best corn utterly ruined. I had already notified the owner of the hogs several times. So I sent a polite note asking him to call at my house. He called; he took me into his confidence and told me that farming was up-hill work for a woman. Advised me to build better fences, said if I had done so before instead of raising a flag pole, it would have been better for me and for him, as then his hogs would not have got demoralized. I listened very quietly until he attacked my flag, (that is my tender point). I do believe I have more eloquence (some people would'nt call it that) than any ten women I ever knew, when my tongue once gets started. I said, "Sir, when I want your advice, I'll ask for it. Demoralize your hogs, indeed! Why they are the very herd of swine that the devil was cast into, for a lady saw them leap a five rail fence with corn in their mouths, and as to my flag pole, that is indicative of my character and independence.

I will give you till night to take care of your hogs, for to-day I shall put up a public notice, that I wish to protect my seed corn from crows and other destructive creatures and in order to do it, shall place strychnine about the hills; now sir, you may let your hogs run wild if you choose."

Another thing I wish to speak of, is Our Farmers' Club. I belong to it, and of course, 'tis first-class. Our officers are prompt and efficient, deeply interested in the coming Fair, and with so large a number working for the benefit of the community, it is strange that we are compelled to be always on the defensive, instead of having good laws to protect us from the invasion of our neighbors' cattle. Very Respectfully,

A woman who believes in justice and demands the same that she is willing to give.

Herndon, Va., Sep 9 1878.

MARRIED WOMEN'S RIGHTS IN THE EASTERN STATES.

IN Maine, a married woman may become possessed of real or personal property by bequest, demise, gift or purchase in her own name, and as her own property.

After marriage she still retains the custody of the property owned by her before marriage, and the same is exempt from liability for the debts of her husband.

She may sue in her own name to recover back her separate property.

In the event of her death without a will, her property, real and personal descends to her heirs.

She has full power to make a will, which requires three witnesses.

In New Hampshire, a married woman can hold property in her own name, may make contracts, sue and be sued, and can dispose of her property by will, and in case of her death without a will, her husband is excluded from any share in her estate.

It will require three witnesses.

In Vermont, a married woman is entitled to the same rights of property as in New Hampshire. Wills require three subscribing witnesses.

In Massachusetts, a married woman may hold property separate from her husband without the intervention of a trustee. A deed conveying land to a married woman must be recorded within ninety days of its delivery, or the land will be liable for the husband's debts.

Any married woman over twenty-one years of age may dispose of her property by will, provided her husband's consent is endorsed on the will in writing. If the devise is to her husband, his consent is not necessary.

Wills must be signed in the presence of three subscribing witnesses.

In Rhode Island, a married woman is entitled to her separate estate, which is not liable for her husband's debts, nor can he control the use of it. She may dispose of it by will in presence of three subscribing witnesses.

In Connecticut, the wife is entitled to her separate estate, which she owned before marriage. The proceeds of any property granted to her after marriage is held by the husband as trustee for her and her children, and his executors must account for the same. With the consent of her husband she may dispose of her property by will, which must be signed in the presence of three witnesses

NEW YORK STATE FAIR.

(Continued from page 601.)

HAY-LOADING by machinery is becoming yearly more popular as its convenience is more fully appreciated. The well-known Foust's Hay Loader, STRATTON & CULLUM, Moadville, Pa., was on the grounds, and it required little explanation. The Loader is easily and quickly attached to the wagon, it requires no extra men or horse to work it, and when in operation it adds but slightly to the draft. It can build a load, under favorable circumstances, in from six to eight minutes. Indeed, so rapid are its operations that at the recent trial at the Paris Exposition it attracted great attention on account of its novelty. The firm now have, besides their Centennial honors, a gold medal from Paris, to hang among their trophies.

WILBER'S EUREKA MOWER was conspicuous among the mowers on account of its construction, which differs widely from the well-known models. This machine secures a direct draft, and an unusually wide cut, six feet, by running the cutter-bar in front of and between the wheels. Light iron rods within the cover act as clearers, leaving the grass raised up, light and in fine condition for curing. The team works entirely clear of the cut grass, and while one horse walks in the grass, that portion trampled is cut by the return of the machine, and thrown up light by the device above mentioned.

The Eureka is made by the Towanda Eureka Mower Co., Towanda, Pa. a company which has complete facilities for doing the best work, and which, by its recent reorganization, has been placed under the direction of capitalists, who appreciating the value of the invention, will push the mower as its merits deserve, and increase its already wide popularity.

ONE of the principal attractions of Machinery Hall was the Boomer & Boschert Wine and Cider Press in full operation—supplying cider to the thirsty crowds.

This press, which is made by the Boomer & Boschert Press Co. of Syracuse, N. Y., is meeting with a large sale among cider-makers and also makers of Apple Jelly. The making of Apple Jelly is now receiving a great deal of attention, as it averages better prices for the product than cider, and this press is well calculated to assist in its manufacture.

G. B. OLIN & Co., Perry, N. Y., exhibited a Spring Tooth Harrow that is a complete departure in construction from implements of this class. The crucible steel, oil-tempered, pointed teeth, are semi-circular in shape, with a strong spring; when in use the points are self-sharpening, and as they become worn, the tooth, by a simple device, may be moved up to line. It is claimed that it will do the work of cultivator and harrow, thoroughly pulverizing the sod. It adjusts itself to uneven ground, overcomes obstructions, is effectual in quack-grass and in packed, dense soil, and as the teeth constantly vibrate they never clog.

B. W. PAYNE & SON, of Corning, N. Y., had the Eureka engine at work among the other steam engines, and their representative was fully occupied in explaining its points to interested spectators, while the exhibitors in Mechanic's Hall depended for their power on the excellent 40-horse stationary engine furnished by this house. It drove the shafting for the heavy machinery in this building with ease, working with a steady, even motion, that was the surest index to its superior construction.

SAXTON & AMIDON, of Buffalo, besides making a full display of the Harris Farm Truck, had a line of Amidon's patent bit-braces and brace-wrenches. These are tools that should receive the attention of farmers, as nothing more convenient could be added to the tool-chest. They are eminently labor-saving, being adjustable to various-sized bits, and exert a power not to be secured in the ordinary brace. They are sold, also, at very reasonable prices.

C. AULTMAN & Co., Canton, Ohio, were represented by their Canton Monitor Engine, Sweepstakes Thrasher, and Cary Horse-Power. These admirable machines are favorably known to readers of the RURAL, and during the fair many of our friends had an opportunity to see them in operation.

The company are beginning to introduce their products in the East, and we have no doubt they will meet with the success that has crowned their efforts in other localities.

ONE of the most attractive machines among the mowers was the "New Warrior," made by the Warrior Mower Co., Little Falls, N. Y. The numerous friends of the old "Warrior" will recognize in the new all the valuable features of the old implement with many others not heretofore shown in any mower. The "New Warrior" is light, neat and attractive, and received many commendations even from its competitors. We predict for this mower great popularity and extensive sales. This company also exhibit one of their improved jointed Randall Harrows. This harrow has become one of the standard implements for soil cultivation, and meets with extensive and largely increasing sales.

WE notice The Farmers' Favorite Fertilizer Drill improved for 1879. This champion of the Field Trials, winning two awards at Philadelphia in 1876, has been crowned with the medal in its class at Paris in 1878. Messrs. Bickford & Huffman may well feel proud of these flattering tributes to the "Favorite," which has for years maintained a prominent position in its department of agricultural machinery. Adopting right principles for performance of work, they have persistently advanced its mechanical construction and finish, keeping in advance of competitors whose struggle to win a prominence over them has been marked by constant and numberless changes of construction and principle. This drill is represented by their general agent, S. N. Gallup, a veteran whose face has become a familiar land-mark, and who as successfully plants the fact of its excellence in the minds of farmers, as does the Favorite its work in the field.

THE exhibit of Heebner & Sons, Lansdale, Pa., arrived too late for entry as a competitor for premiums, owing to the pressure of business. Indeed, it was with difficulty that Mr. Heebner could secure a Separator and Power to show at all. The level-tread power made by this firm is fast attaining a wide popularity. It possesses some distinctive features: chief among which are its level-tread and speed regulator. The tread-planks are so arranged that the horse stands in a natural position, and walks easily without straining himself, knocking his knees to pieces, or wearing out the tread-planks unnecessarily. The horse cannot step on the cross-rods and throw the track-wheels out of line, and the wheels themselves, not being bored through, prevent the cross-rods from wearing and working through the wheels. It was remarked that the power developed by the Little Giant Thrasher and Cleaner seemed out of proportion to the slow pace of the horse, who moved in the power at a very slow walk, as if too lazy to put one foot before the other; and yet the speed regulator had to be set slow to prevent acceleration of power. The speed-regulator is a governor consisting of two iron-hinged balls set inside an iron rim that fits in the band-wheel. It is a perfect governor, and in case of accident, will check the speed to a uniform motion. The power by this regulator can be adjusted to any desired rate. It is one of the most noteworthy improvements we have noticed on the grounds. The Little Giant Thresher has been greatly improved this season to suit the requirements of special localities. Its construction is as good as the best.

A FIVE-TON HAY SCALE for twenty-five dollars, exhibited by Osgood & Co., Binghampton, N. Y., attracted a great deal of attention. The irons complete, with brass beam, points and weights, sealed to United States standard weights are furnished for the above money. A large number of these scales were sold on the ground—and they have given universal satisfaction wherever used.

THE OLIVER CHILLED PLOW WORKS, South Bend, Ind., make a grand display of their celebrated Chilled Plows. These plows have met, and continue to meet with great success wherever introduced, and the manufacturers have now appointed a general agent for New York (Mr. I. M. Adams, Rochester, N. Y.), who will make, for the first time, a thorough and systematic canvass and see that these Oliver chilled plows are brought to the attention of every one. The Oliver plow has a host of friends throughout the country, and they are already being numbered by thousands in this State.

G. VAN SICKLE, Shortsville, N. Y., exhibited his Champion Hay and Grain Unloader. This implement differs from the ordinary elevator in one important respect. It uses no fork or grapple. The work is done by means of rope slings that are placed in position during the loading. The inventor is a practical farmer and claims that his device will successfully handle everything in the shape of hay and straw, loose, bound, short or long. It can be adjusted to unload in but four drafts, if desired, and always does clean, neat work. Not the least interesting part of the mechanism is the turn-table, which permits of instant adjustment, so that unloading may be done in any direction.

A NEW FORK, made by E. V. R. Gardner & Co., Johnson's, N. Y., claims the following good points: It is a grappler, and pitches equally well loose or in the bundle, long or short, barley, beans, cornstalks, hay, and any material for which a fork may be used. The four tines, which work like harpoons, may be lengthened or shortened to suit the work, and in tripping the tines drop straight down, which clears them entirely of the load. The Car also has new features that render it an important improvement.

JOHNSON, GERE & TRUMAN, Owego, N. Y., exhibit their new model Champion Grain and Fertilizer Drill. This drill, which is a perfect force-feed, is adapted to sowing all kinds of grain, large or small, and its force-feed distribution is so perfect that it sows evenly in any position without variation. It sows perfectly all kinds of fertilizers that can be drilled in or sown broadcast. The gear that drives the distributor is now placed under the grain box, where sand or dirt cannot interfere with it.

M. WILLIAMS & Co., of St. Johnsville, New York, made a very fine show. Their Thrasher possesses some very striking features that commanded the attention of visitors that were interested in this branch of farm machinery. Their new thirty-six inch cylinder thrasher and separator was in operation in connection with their three horse tread-power, which runs it with ease. This new thrasher is an eight or ten horse machine, and can be arranged for either horse or steam power. The firm have attained an enviable reputation for turning out first-class work, and this year have sold all the machinery they could manufacture.

THE JOHNSTON HARVESTER Co., Brookport, N. Y., made one of the finest displays on the ground, both as regarded the number of machines exhibited and the quality and finish of the implements. The new automatic sheaf-binding reaper was in operation and commanded an uncommon share of visitors' attention. The binder was the attraction. Its mechanism is simple, and its work effectual. The grain always falls inside the twine, which passes through a needle having two motions. This needle carries the cord twice around the sheaf and descends through the table, bringing the cord together. Then by the combined action of a finger, hook and claw, a firm knot is made which completes the bundle after the string is severed. The knot is an over-hand with double cord twisted in itself and pulled through, capable of standing a test strain of 150 pounds—a greater pressure than it will ever be compelled to stand. This reaper has been very successful both here and in Europe. The six other machines were the wrought-iron harvester which secured the highest honors at the field trials held under the auspices of the Paris Exposition, the old favorite, No. 1, combined reaper and mower; the No. 2 combined machine, the Continental light reaper, and the new changeable speed mower. The "Continental" is a light reaper, designed to work to the best advantage on side hills and uplands, where its light weight, only six hundred and twenty-five pounds, and adaptability make it one of the best machines for the purpose.

The new changeable speed mower is especially distinguished for its light weight, tipping the beam at five hundred and forty-seven pounds, when fully equipped for the field. This mower has during the brief time it has been before the farming public made a handsome record for thorough work and is a model of strength, lightness and durability. It is certain to render a brilliant account of itself next season. The Johnston Harvester Co. are noted for the completeness of their exhibits, and the display at Elmira was no exception to their usual practice.

THE Wheeler & Mellick Co., Albany, N. Y., made the most varied display, perhaps, of any one exhibitor on the fair grounds, comprising thrashers, horse-powers, harrows, cultivators, horse hay-rakes, hay forks, etc. A new implement, La Dow's two-horse riding cultivator, has been recently introduced, and is destined to attract wide attention. Superior excellence is claimed for it in the cultivation of corn, or any hoed crop. Its revolving cutting-plate wheels lift, turn, and leave the sod in fine condition to promote the quick growth of plants. Weeds and rubbish are cut up and gotten out of the way by burying or separation. The teeth, or discs, are self-cleaning, and may be adjusted to run close to the young plants without injuring the roots, while the weeds are demolished. The earth may be turned either towards or from the rows, and the gangs of discs can be set to cut deep in the center between the rows, and shallow near the plants. It is easily operated, and the draft is controlled by whiffle-trees and hangers, so as to remove any strain from the horses' necks.

The other implements made by the company are very generally known, and need no further praise than that which they compel by their performances in the crops for which they are severally designed.

THE DAIRY SUPPLY Co., New York devoted their entire space to Jno. Campbell's Monitor Churn. The churn is a cylinder with conical ends, devoid of dasher, paddles, or inside work of any kind. In operation it is swung like a pendulum from ropes that depend from the ceiling, or other covenient place, and when the churning is finished the churn can be swung out of the way. It is claimed that it combines the most perfect aeration with the greatest desirable rapidity of churning; that it is cleansed and kept pure with ease and that it washes the butter so quickly and perfectly that no working is required except for salting, and finally that the butter made is very superior.

NOTES FROM THE BROOME CO., N. Y., FAIR.

THE Broome County Agricultural Society held its eighth annual fair at Whitney's Point, September 3-7. The first two days were rainy. Still, in spite of rain and mud, the people came. The show in Floral and Agricultural Hall was large. The exhibit of wheat was larger than ever before. Corn, potatoes and apples were not as well represented as heretofore owing to the early date of the fair. The exhibit of thoroughbred and grade cattle was large; so was that of horses, which showed that the farmers own, admire and know how to raise good animals. Among swine the most admired were the Essex and Poland-China. The display of farm implements was excellent, and among the exhibits was the Syracuse Chilled Plow, which took the premium at the plowing match, being just thirty minutes in turning the first six furrows. Taking all into consideration, the fair was a success in spite of the rain. The crowd was immense on the two last days, and the trotting good. The Society's grounds are as fine as any in the State. They contain a large maple grove, covering nearly one-half of the area. The surface is dry and, with the new buildings recently erected, well suited for the use intended. W. B. D.

News of the Week.

Monday, Sept. 16, 1878.

POLITICAL.

Until last Monday's election the republican party has held Maine since the repeal of the Missouri Compromise under poor Pierce. The late election, however, contrary to general expectation, has proved a victory for the greenback party which holds the second place as a formidable rival of the republicans. As neither the republican, greenback nor democratic candidate for governor secured a majority of votes, the election now goes to the legislature, which consists of 65 republicans, 2 democrats elected by republicans, 27 democrats and 57 greenbackers. The house, which is thus placed in the hands of the greenbackers and democrats, chooses two candidates, one of whom the senate must elect. Three of the five congressional districts have been carried by the republicans; in the fourth district an extremely unpopular republican candidate was forced by the caucus on the party, many of whom bolted and elected a greenback-democrat. The greatest humiliation, however, was suffered in the fifth district, where Eugene Hale, the present well-known representative, was defeated by a stonemason named Murch a violent, ignorant demagogue of the Kearney type, whose great merit lies in his strong greenback principles. The democrats seem to have been thoroughly demoralized, having lost half their strength to the new party, while the republicans only lost about one-sixth of theirs. The total vote for governor in 1877 was 101,821, of which the republicans had 53,631; democrats, 42,114; greenbackers, 5,265. This year the total vote was 124,000, of which the republicans got 58,000; greenbackers, 37,000; democrats, 29,000. The news from Maine, Maine, Maine, has been waited for anxiously as a sign of the drift of public opinion ever since 1840, when the State broke away from the democrats and "went hellbent for Governor Kent," the whig, by a majority of only a trifle over 400, and so served not a little to swell the tide of popularity on which, later on in the fall, "Tippecanoe and Tyler too" were borne into office. There is no doubt but that now the issue of the late contest will have a great effect on the approaching elections, everywhere encouraging the greenbackers, whether known by the name of Nationals or Labor party. Butler's chances in Massachusetts have already risen fully 25 per cent., and all over the country there's a shaking up among the dry bones and fossils of the political world. Butler has received the nomination of the greenback-labor party, and is making a vigorous effort to secure that of the democrats. A few of the leaders of this party having declared that Butler delegates would not be admitted to the democratic convention to be held at Worcester to-morrow, Butler insists that the members of the convention are the sole judges of the eligibility of the delegates, and that this ukase is a mere bit of nonsense. He will be present in Worcester and if his men are not admitted, they will probably hold a separate convention and nominate him unanimously. If he gets the democratic nomination, his election is not improbable; if he does not, he'll break up the democratic party worse than it was shattered in Maine.

MISCELLANEOUS.

With a view of getting public opinion on the side of the revenue authorities in Ga., good sound democrats have lately been appointed as revenue officers there, but the bullets of the moonshiners at Hancock Co., in a recent collison, paid them no more respect than if they had been republicans. On Thursday the country was startled by the announcement that Gen. Miles, and a party of tourists had been surrounded by the Bannock Indians in Yellowstone Park, and twenty-seven of them killed. On the following day the public anxiety was relieved by the announcement, that instead of being killed, Miles, with 27 soldiers and 34 friendly Crow Indians, had attacked a party of Bannocks, killed 13 and captured the rest, 34 in all, with the loss of Capt. Bennett and two of his men.

Gen. Howard has had an interview with Chief Moses out at Priest's Rapids, Wy. Ter., and received from him assurances that his people are anxious to maintain peace and to go on a reservation, so soon as one is assigned them.

A match has been made between the pedestrians O'Leary and Hughes for a six days' contest for $1,000, the belt the former lately won in England, and the championship of the world. Test to begin at Gillmore's Garden in this city Sept. 30 and to end Oct. 5, both parties to get over the most ground they can, either by walking or running. A match has been made between the celebrated oarsmen Hanlon of Toronto and Courtney of New York, for a five-mile race for the championship of America.

On Friday last a severe wind and rain storm, in

some places amounting to a cyclone, extended from about Goldsboro, North Carolina, through Va., West Va., Ohio, Pa., New York, and parts of Ontario, Canada. Many of the rivers throughout this vast region rose with extraordinary rapidity, flooding the surrounding country, and causing a great loss of all kinds of farm property, mills and stock. In many places the railroad bed was washed out, and consequently several railroad accidents have happened, delaying travel and causing a number of deaths.

Gen. Badeau, Grant's biographer and friend was, some months since, stricken from the army list, during a spasmodic fit of Civil Service Reform, on the ground that, being consul-general at London, he could not hold two offices at the same time. He has just been restored to the retired list, however, whereat many independent republicans, whose independence consists in opposition to Grant, are disposed to howl; nor is it pleasing to them them that Mosby, another adherent of the ex-President, should have been appointed to a consulship in China, or that Longstreet, a friend and connection of his by marriage, should be appointed revenue agent in Georgia and Florida.

The increase in the export of live stock from the United States to England in the year ending June 30 was 30,800 head of cattle, and 4,000 head of sheep. The actual numbers exported were 80,040 cattle and 183,995 sheep. In addition thereto, 54,000,000 pounds of beef went over, an increase of 5,000,000 pounds.

FOREIGN.

The German Reichstag has been opened, and the emperor's speech urges the adoption of strong measures for suppressing the pernicious doctrines of socialism. The Liberals are displeased at the tone of the speech and still more at the stringent laws introduced to carry its suggestion into effect. The government is in a very decided minority in the new Reichstag, and its forces combined cannot carry any measure to which the Liberals are opposed, without the aid of the Ultramontanes. This Bismarck cannot get at present, as the trouble with the Pope has not yet been removed, each party strenuously trying to get the best of the bargain. Quick upon the execution of Hoedel, the would-be assassin of the emperor, follows the death of Nobeling, the other would-be regicide. He died last Tuesday, from the effects of the wounds he inflicted on himself immediately after he shot the emperor. Now the Socialists claim that his doctors designedly killed him by rough treatment, in order to avoid the evil effects that might be produced on the public mind by the pleadings during his trial. He has made no confession, nor did he during the whole of his illness implicate any accomplice.

The heavy loan the Russian government lately threw on the money market is reported to be a failure. The impotency of Austria against Bosnia, having shown Russia that she had little to fear from that quarter in her quarrel with Turkey, Count Schouvaloff, who was the chief agent in bringing about the Congress of Berlin by exaggerating to the Czar the danger of an Anglo-Austrian alliance, has fallen into disfavor, been released from office at his own request, and will devote his time and talents to the settlement of the Bessarabian and Dobrudscha question. Roumania hesitates about occupying the latter territory, as the inhabitants are reported to be intensely hostile to such a measure, and with the example of Austria's difficulties in Bosnia, before her eyes, the petty kingdom is afraid to risk a similar resistance. There has been a kind of Nihilist rebellion at Odessa in the Crimea, and after its suppression stringent laws against that party have been promulgated throughout the Empire. The present emperor, some years ago, introduced trial by jury in nearly every case, but owing to late political disturbances, all political offences in future will be excluded from such a mode of trial and be decided exclusively by the judges appointed by government.

The English find Cyprus a very unhealthy spot, 307 of their 2,540 troops there being already in hospital on account of fever. On Wednesday last a terrible explosion of coal gas occurred in the Elbow Vale colliery in Monmouthshire, Wales, killing 281 miners out of the 371 in the mine at the time. Already 632 bodies have been recovered from the wreck of the excursion steamer Princess Alice which was sunk in the Thames last week. Such fearful losses of life occurring so close together, have justly produced a widespread sensation. Advices received this morning say that a new treaty has been made with Turkey, by which Great Britain assumes a protectorate over Egypt, with the consent of France, who will join her in trying to set to rights the muddled finances of that country.

Germany has sent a circular to the Powers that signed the Berlin treaty, urging them to press Turkey to fulfill the terms of the treaty at once. All have agreed to do so but England and Italy. Greece is still clamoring for more territory. All the powers, except England, are willing to bring pressure to bear on Turkey so as to compel her to accede to the demands of the petty kingdom, but in the absence of England's consent, nothing is likely to be done for some time at least. When urged to set about making the promised reforms in Asia Minor, the Porte insists that money is needed to undertake the task, and no money is now in the treasury. En land has already detailed Lieut. Cameron, the African explorer, to investigate the best route for a railroad from the Mediterranean to the Persian Gulf.

France is to have a new deep-sea harbor at Boulogne-sur-mer, $3,400,000 having been voted towards its construction. To the fourth of this month the receipts for entrance to the Great Exposition amounted to $1,482,444. The Austrians have completed the occupation of Herzegovina by taking possession of Trebinye, and the retirement of the Turkish regulars who forced the inhabitants to surrender by threatening o fire on them from the citadel unless they gave up their arms. Many of the insurgents, however, have taken refuge in the mountain fastnesses, whence he will keep up the unequal contest, while others have joined the Bosnians who are resolutely holding out. The campaign for the present season will be over in from three to four weeks more, and it is highly improbable that the occupation will be completed in that time. Some deadly fighting takes place every day, and by this time the number of dead on both sides equals that in a couple of severe pitched battles, the Austrians having suffered a loss of upwards of 3,000 in a recent engagement. Their numbers in the field now are estimated at upwards of 200,000 men, while the detached bands of Bosnians and their allies from Albania and other sources, are computed at upwards of half that number. The country, however, being extremely mountainous and thoroughly known to them, affords them admirable opportunities for defence. Moreover, owing to their guerrilla system of warfare, a large force is required to keep open the Austrian lines of communication. Russia is said to be urging Austria to annex instead of occupying the rebellious provinces, but for the present, Austria modestly declines doing so. HERMAN.

VARIOUS.

A Mrs. Cassidy of Blandensburg, Md., gave birth Aug. 30, to three girls and two boys, who were all living at last accounts.

Mr. Gordon, Inspector of Live Stock in Queensland, Northern Australia, computes the loss in sheep there last year, by drought, at 1,718,199 head.

The Great Eastern, it is said, has been bought by a company for use as a cattle boat to carry Texas meat to England. Her capacity will be 2,200 head of cattle and 3,600 sheep.

The first weeping willow in England is said to have been planted by Alexander Pope. He received a present of figs from Turkey, and, observing a twig in the basket ready to bud, planted it. From his stock all the millions in England and America are believed to have sprung.

A miller in England, who had beaten his wife and threatened his children because summoned for not sending the latter to school, was last month seized by forty women, who flogged him and then dragged him to a pond, where, while drenched with water, he implored pardon for his misdeeds.

Five tramps recklessly resolved to capture Kenton, Ohio. They marched into the village flourishing clubs, terrified a few women, and began to pillage a store. Their triumph was short. The villagers gathered in force, stripped them, dipped them into a barrel of tar, rolled them in sand, and drove them out of town.

Quinine has advanced in price, until it is now higher than it has been seen in this country since the rebellion. This is attributable not only to the spread of malarial disease, but to the falling off of the supply of bark, owing to troubles among the South American tribes of Indians who are the principal gatherers. They have shipped no bark for eight or nine months.

Mgr. Dupanloup is a life Senator of France. In spite of his age he takes an active part in the labors of the Upper Chamber. The frequenters of Versailles daily see him passing along the street, clad as a simple priest, and carrying an old, worn-out portfolio. This article has a history. It was given to the bishop of Orleans, then simply Abbe, by Talleyrand. That portfolio has contained the treaty of Vienna, and other diplomatic documents which passed through the hands of the great diplomatist from the time of Napoleon I, to that of Louis Philippe.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 14, 1878.

BEANS AND PEAS.—A few straggling lots of new beans have appeared, quality showing hurry to send in first receipts. They have sold above quotations for old, but these uncured samples are not wanted by the general trade. An instance of ridiculous haste is shown by some new red kidneys that had to be unbarrelled and dried before they could be sent away. Old mediums are not plenty, and prices are steady. Marrows are weak, though there has been a good export purchase. Pea beans and white kidneys quoted stiffer. Southern H. P. peas in a small way, 2 bush. bags, $4; new green offered rather freely at $1.35; Canadian peas nominal, 78@79c. Beans, medium prime, $1.50@1.52; fair to good, $1.40@1.45; marrow, prime, free on board, $1.60@1.52½; fair to good, $1.40@1.45; pea, $1.35@1.55; white kidney, $1.40@1.55; new red kidney, $3.25; black beans, old crop, about gone; new expected to open low.

Receipts of beans, for week, 6,113 bush. Exports, 1,297 bbls.

BEESWAX.—There is a very meager business but prices steady; Western and Southern quoted 27@28c. Exports, past week, 2,243 lbs.

BUTTER.—Receipts for week 32,319 pkgs.; exports past week 13,521 pkgs. Fine grades of butter have improved, but it is not an improvement for wholesale quantities. Receipts are generally lacking in straight or evenly good lines, and it looks as if some low bulk prices will eventually offset any good rules now obtained for tops of present supply. It is likely that best buyers will piece along until fine full is a regular commodity; and a large yield is counted upon. Welsh tubs are wanted by all classes of buyers, but they will have to wait for fresh. Welsh butter districts have been making cheese most of the season. A few firkin dairies have sold at 17@18c. Trade to the South very much restricted by the calamity there. Western butter has a good demand when up in grade, but as with State there is nothing to favor is in a general quality way.

State dairy, pails, choice, 21@22c.; other, 16@18c.; half tubs and pails, choice, 20@21c.; other, 16@18c.; Welsh tubs, choice, 18@19c.; other, 12@17c.; poor State, 11@13c.; creamery, best, 23@24c.; good, 19@20c.; sweet cream, 20@22c.; Western creamery, best, 21@23c.; other, 15@21c.; Western dairy, selected, 15@16c.; fair to good, 10@12c.; factory, best, 10@12c.; fair to good, 8@9c.; very poor, 6½@7c.; grease, 4@5½c.

CIDER.—Offered at 7c. to arrive at wharf.

COTTON.—The new crop is coming forward more freely, offering full assortments, and prices have declined. Latest prices are; September, 11.31@11.32c.; October, 11.06@11.07c.; November, 10.92@10.93c.; December, 10.91c.; January, 10.93c.; February, 11.99@11c.; March, 11.07@11.08c.; April, 11.15@11.16c.; May, 11.22@11.23c.; June, 11.28@11.30c.; July, 11.34@11.36.

Quotations for new on spot are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

Stained.

Good ordinary 9¾; Strict good ordinary 10¼
Low middling 11¾; Middling 11¾

CHEESE.—This has been a very unsatisfactory week in this market. Shippers have been very indifferent, and although receipts ordinarily would be considered moderate, yet they have accumulated; this applies to the general grades, and an exception made for fancy lots. Strictly choice, late made, have been held with a fair show of strength, and have reached 9; but 8¾@8¾ have been more general figures.

Quotations are: Fancy at 8¾@8¾c.; 7@8c. for good and prime; 6@7c. for fair to good; 5@6¼c. for half skimmed; 3@5c. for skimmed. State, farm dairy at 7¾@8c. for good to choice, 6@7c. for fair to good, and 3@4¾c. for poor skimmed. Wisconsin factory, fine to fancy, 8¼@8¾c.; do. good to prime, 6¾@7¾c.; do. fair, to good, 5¾@6¾c.; Western factory fine, full cream, cheddar, 7¾@7¾c.; do. fine, full cream, flat, 7¼c.; do. good to prime, flat, 6¾@7c.; do. half skimmed, 5@6c.; do. full skimmed, 3@4¾c.

Receipts for week, 69,694 boxes.
Exports for week, 33,317 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 43s.

DRIED FRUITS.—In Apples the only grade is in small lots of choice sliced, which bring firm prices. Peeled peaches have eased off a little with diminished trade. Blackberries are very slow. Cherries are in better supply and easier.

New blackberries, quoted at 5¾@6c. Peaches—Peeled, new Georgia, 6c. for poor, 7½@8c. for fair to good, and 8¾@9c. for prime; choice North Carolina 11½@12½c.; good do., 9@10c.; unpeeled old halves, 3@3½c.; quarters, 2¾@3¼c. Pitted cherries, 15@15¾c.; southern plums, new, 10@11c. Apples—Old State quarters, 3@4c.; do., sliced prime, 4½c.; do., good, 3¾@4c. New apples 3@4c. for southern quarters in bbls.; 4¾@5½c. for prime sliced, and 6@7c. for fancy. New raspberries, 23@24c., and evaporated, 26@27c.

Exports past week 215 bbls. dried apples.

EGGS.—Receipts for the week 5,730 bbls.; do. last week, 5,527 do. The market has improved and closes strong; near points, 20c.; State and Penn., 19@19¾c.; fresh Western and Canadian, 18@18¾c.; inferior, 17½c.; Western marks are not turning out as finely as at our last; some lots bear evidence of long holding. This fact may tend to vary the rates for Western compared with Canadian.

FRESH FRUITS.—Export past week, 1,150 bbls. apples. Supplies of apples are largely in excess of the demands and prices have broken under them. Fine table lots have sold in loads at $1@1 12 ₱ bbl. Western N. Y. choice, $1.25@1.37; poor to fair including near by, 75@$1.00. Bartlett pears scarce and higher, ice-house stock comes out poor this season; has a wide range, $2.50@7 ₱ bbl.; prime, $8@9; fair, $5@6; Seckel, $3@4 for common, $6@7, prime. Duchess not wanted yet. A line of Beurre d' Anjou offered at $2.50@3.50 ₱ bbl. Flemish Beauty, B. Clairgeau and Louis Bonne all go within the range of $4@$6, as they are green for use. Plums have ruled high but the rates have checked sales; prices now irregular. German Prunes ₱ bbl. $2@10; Green Gage, $8@10; Damson, $5@6; Blue Gage, $4@5; common plums, $3@4.50. Grapes are low, most of the pickings have been badly affected by the late damp weather. N. J. are hard to sell, quoted 1½@3c. for Concords; up-river do. 3@4c.; Delawares 6@8c. Peaches are winding up especially from Delaware. Good to prime Del. baskets $1.25@1.75; poor 75c.@$1.00; N. J. selected, $2.50@3; common to prime, $1@2. Watermelons steady at $20@30 ₱ 100, selected; $14@18, prime; $5@6, culls. Nutmeg melons $1@1.25. California Tokay Grapes $5@6 ₱ 40 ₱ case; Muscat, $5@5½, all prime. Hot-house grapes B. Hamburg Muscat, ₱ ₱, 35@40c. Sweetwater, 30@25c. Peanuts dull; sellers willing to accept inside figures. Hand-picked Va. $1.45@1.50 ₱ bush.; fancy, $1.25@1.30; good to prime, $1.15@1.20.

FLOUR.—The arrivals have been large, especially of the new crop winter wheat, and the trade has found it necessary to shade prices to impart any activity.

Latest prices are $3.25@3.85 for very inferior to fancy superfine State, and occasionally $4; $3.30@4.10 for poor to good extra do. odd lots and lines; $4.15@4.45 for good to choice do., strictly choice lots above this; $3.25@3.85 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c.; $3.90@4.15 for inferior to good shipping extra do. and $4.15@4.40 for good to choice extra do.; common to about choice white wheat extras, $4.15@5.25; choice to about fancy do. at $5.30@6.25; red and amber winter wheat, inferior to choice trade and family at $4.00@5.50; round hoop Ohio at $3.90@4.25, and trade and family brands of do. at $4.25@5.50, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.10@4.90 for very poor to good extra, and $4.90@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.15@6.00 (fancy brands at higher prices); Minnesota "straight," inferior to very fancy at $5@7.50 (few brands of even fancy going above $7), and patent fair to strictly fancy at $6 25@8.75; unsound stock at from $2.00@5.00; city mill extra at $5 00@5.25 for West Indies (the latter rate for fancy in new packages); do. for England, 4.00@$4.10; do. trade and family extras, $5.50@6.50; do. for South America, $5.30@5.90 for fair to fancy; No. 2 at $2 25@3.15 for inferior to very fancy, the latter an extreme.

CORN MEAL.—Sales at $2.90@2.95 for Brandywine and $2 40@$2.65 for yellow Western.

GRAIN.—Wheat has been in large receipt, and has been offered lower, leading to a fair export movement.

Latest sales are of ungraded amber at $1 01@1 09; No. 2 amber, steamer grade, at $1 05¾@1 06½; No. 2 amber, in lots, at $1 07@1 07¾; No. 3 red, in lots, at $1 04@1 04¾; do. steamer grade, at $1 02@1 03; ungraded red, at 95c.@$1 08; No. 2 red, steamer grade, at $1 03¾@1 06¾; No. 2 red at $1 07¾@1 08; No. 1 red at $1 07¾@1 08¾; ungraded white $1 06@1 16; No. 2 white lot $1 11¾; white State at $1 15@1 18; No. 1 white at $1 14¾@1 15¾; No. 1 white, steamer grade at $1 12@1 13; extra white, near-by deliveries at $1 16; No. 1 white, deliveries last half September, quoted at $1 15¾; New York No. 2 spring, September option, reported at $1 05¾; No. 2 amber, September option, at $1 07@1 07¾; do., October option, at $1 07¾; do., delivery last ten days in September, at $1 07¾@1 07¾; No. 2 red, delivery by September 25, at $1 08; do. September option, at $1 07¾@1 08; do. October option, at $1 08@1 08¾; No. 1 red, delivery by September 25, at $1 08¾. Rye at 60@61 for State, and 59¾@61 for western. Corn is in moderate receipt and firm in price; latest sales are of ungraded mixed, western, at 42@45c.; ungraded white at 53c.; New York No. 2 at 50¾@51¾c.; steamer mixed at 49¾@50¾c; New York No. 2, September option, at 50¾c.; do., October option, at 51¾@51¾c.; do., for November, at 53@53½c.; steamer mixed, September option, 50@50¾c.; do., October option, at 51¾@51¾c. Oats are in liberal receipt and easy in prices; sales are of New York No. 2 white at 29½c.; New York No. 3 white at 27c.; New York No. 1 at 31¾@32c.; New York No. 2 at 29@29½c.; New York No. 3 at 25@25½c.; New York rejected at 24@24¾c.; New York unmerchantable at 24½c.; white western at 28¾@31¾c.; mixed do. at 24¾@31¾c.; white State at 30@30½c.; mixed do. 27@33c.; No. 2 Milwaukee at 31c.; No 2 Chicago new, quoted at 30¾@31c.; and old at 32@33c.; New York No. 1 white, quoted at 36@37c.; New York extra, quoted at 33@33¾c.

HAY AND STRAW.—There are pretty full receipts, and although demand is increasing, prices of other than prime stock are weak.

Sales at 45@50c. for shipping and 65@80c. for retail qualities. Straw quoted at 35@45c. for long rye; 25@30c. for short rye.
Exports past week, 2,750 bales.

HOPS.—Shipping demand is still slack. Supplies increase, but are largely of grades under prime, showing premature picking. Prices show a wider range to cover the various qualities.

Quotations are for New Yorks, new crop, 16@18; New Yorks, new crop, good and prime, 14@15; New Yorks, new crop, poor, 11@13; Eastern, new crop, none; Wisconsin, new crop, none; Yearlings, growth 1877 (nominal) 5 to 10; Pacific coast hops, growth 1877, 5 to 10.

HONEY.—Quoted with a few sales at 14@16c. for white clover; 10@12c. for buckwheat. No permanent demand.

OIL-CAKE—Is selling at $31 per ton.

PROVISIONS.—Hog products have shown a better export demand but have been variable in price, closing easy. Mess pork quoted $9 25@9 50 for spot lots; $9 20 for October; and $9 30 for November. Bacon at 6¼c. for long clear and 6⅛ for short clear. Lard at $7 05 for spot lots; $7@7 02½ for September and October; $6 97½ for November; and $6 90 for December. Stearine at 7¼@7⅜c. for western. Tallow at 7@7 1-16c. for prime. Beef hams at $12@19 50. Beef—extra mess, $11 25@11 50; plain mess, $10@11; packet, $11@11 50 for bbls.; extra India mess, $18@20 for city brand; do., Philadelphia, $17 75@$18.

POULTRY AND GAME.—Live fowls have ruled weak and low prices brought out quite a large Cuban trade. About 5,000 selected go to Santiago by next steamer. Chickens easy. Turkeys dull as dressed begin to come. Ducks and geese dull; the former are poor in quality and, as we have before remarked, should be fattened at home. The demand for geese is expected to revive with the approaching Jewish holiday.

Chickens, N. J., 12½@13c. lb.; State and Penn., 12@12½c.; Southern and Western, 10½@11c. Fowls—N. J., 11@11½c.; other, 10@11c. Roosters, 5c. Turkeys, choice, 12@13c.; other, 10@11c. Ducks, prime, pair, 50@75c.; other, 40@45c. Geese, N. J., $1.25@1.75; W. & S., $1.00@1.25.

The market is firm for dressed turkeys and prime fowls at our prices. Chickens doing a shade better.

Dry picked and prime N. J. turkeys, 14@15c.; other, 12@13c; chickens, fancy, 17@18c.; N. J., 14@15c.; other, 12@13c. Dry picked fowls, 14@15c.; good to prime, State & N. J., 10@12c.; poor to fair, odd lots, 9@10c.

Game is active and prices fair. Trapped grouse, 65@75c. ₱ pair, State partridges, 90c.@$1; Western, 80c. Woodcock, 75@85c., the latter for near points. Wild pigeons, still-fed, $1 50@1.75 ₱ doz.; flight, $1. Wild ducks, common to Mallard, 30@60c. ₱ pair.

SALT.—Sales at $2.50 for Ashton's; $1.05@1.30 for other brands.

SEEDS.—New timothy is plenty and easy, quoted $1.30. Rough flax is strong at $1.52½, and wanted.

TOBACCO.—A liberal business is noted in seedleaf on home account, and the export trade in Kentucky leaf is fair, with prices strong. Latest prices are for

VEGETABLES.—Exports of potatoes, past week 7,815 bbl.; of Onions, 445 do. Potatoes are bringing good prices. States still objectionable in quality. Choice cabbage higher, Onions dull. Prime E. Rose potatoes in bulk, bbl. $2@2 25; fair to good, $1 62@1 87; Peerless, $1 50@1 75; Md. Sweet, $1 62@1 75; Va. yellow, $1 50@1 75. Sweet Corn, 100, 75c.@$1; Lima beans, bag, 75c.@$1, shelled, bushel, $3@3 50; String Beans, L. I., 50@75c.; Cucumber pickles, 1,000, $1@1.25; Tomatoes, bushel, 30@45c.; Onions, white and red, $1@1 25; Chester, $1@1 12; Marrow Squash, $1 75@2; Peppers, Bullnose, 100, $1@1 50; Beets, bbl., 75c.; Lettuce, 55@75c.; R. turnips, $1.75@2.; Carrots, $1 50; Cabbages, Flat Dutch, 100, $2 50@5; Okra, 12@15c.; Egg plants, $1@2.50.

WOOL.—The demand from manufacturers runs moderate, and confined to small lots. There is more confident temper among holders as to prices, however, more thorough advices from other points noting increased distribution.

Quotations are—Ohio, Pennsylvania and West Virginia—XXX and picklock, 40@42c.; XX, 36@38; X, 35@37; No. 1, 33@33c.; No. 2, 33@35c; coarse, 30@32c, combing, 40@45c.

New York, Michigan, and Wisconsin, XX, 32@35c.; X, 32@35c.; No. 1, 34@36c.; No. 2, 31@33c.; coarse, 27@30c.; combing, 38@43c.

Indiana, Kentucky and Tennessee—XX, 33@35c.; X, 33@35c.; No. 1, 34@36c.; No. 2, 32@34c.; coarse, 27@30c.; combing, 33@42c.; unwashed combing, 28@33c.

Illinois, Iowa and Minnesota—XX, 34@35c.; X, 32@34c.; No. 1, 33@35c.; No. 2, 28@31c.; coarse, 25@27c.

LIVE STOCK MARKETS.

Saturday, Sept. 14, 1878.

BEEVES.—Receipts for the week, 11,836 head; do., last week, 12,350 do. The dressed beef market has been dull, and sales on the hoof have not been brisk. The offerings have been largely composed of thin, Texas, Colorado and Cherokee stock. A few fancy Ohio brought 10c., to dress, 57 lbs., but 10c. was the general best price for prime steers, to dress, 57 lbs.; common to good, natives, to dress, 55 lbs., ranged at 7¾@9¾c. Texas, Colorado, Cherokees and half-breeds, to dress, 55 lbs., 6¾@8¾c.

COWS AND CALVES.—New York is growing to be less and less a place of sale for milch cows. Parties who require any regular supply, deal direct with dairy districts. Quotations nominally as before.

VEAL CALVES.—The supply is liberal and prices are tame; ordinary to prime, milk, 5¾@6¾; a few extra N. J. 7c.; buttermilk and grassers, 3@3¾c.; "fed" calves, 4@4½c.

SHEEP AND LAMBS.—Receipts for the week, 28,705 head; do. last week, 28,688 do. A large unsold surplus of dressed mutton has kept the market at the yards dull. Sheep sold at the low prices of 3@4½c., and lambs, 4½@5¾c.

SWINE.—Receipts for the week, 20,783 head; do. last week, 18,353 do. Western, live, 4¾@4¾c.; N. J. dressed arrived in bad order, had the wide range of 4@6½c.

Reading for the Young.

LINES FOR BOYS TO REMEMBER.

"What shall I do?" My boy don't stand asking:
Take hold of something—whatever you can.
Don't turn aside for the toiling or tasking;
Idle, soft hands never yet made a man.

Grasp with a will whatever needs doing;
Still stand ready, when one work is done,
Another to seize, then still pursuing
In duty your course, find the victory won.

Do your best for to-day, trust God for to-morrow;
Don't be afraid of a jest or a sneer;
Be cheerful and hopeful, and no trouble borrow;
Keep the heart true, and the head cool and clear.

If you can climb to the top without falling,
Do it. If not, go as high as you can.
Man is not honored by business or calling;
Business and calling are honored by man.

Mrs. Gage.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 17.

W. T. ALAN.

I have a new idea for the young folks for earning pocket-money, which will bring prices according to the quality of workmanship. It is a window-bracket for pots—something that everyone who keeps a pot for plants needs, and which many think is too expensive when purchased at stores. This one of wood is very simple, and can be made according to the strength of the wood and the weight it will have to bear. After the strips are made, they should be put together with a square, that they may be perfect. Mark the ends of the brace by laying them on a square and sawing them accordingly. Where the brace connects

Window-Bracket for Pots.

with the arm at A, fasten with a screw: at B and C, long screws are needed, a couple of inches or more: cut off the heads, and heat and bend to form hooks; then get small eyes at the hardware store, and screw to the window-casing where the hooks come; let there be room for plenty of play so that the bracket will swing around well. At E set a spool or turned piece of wood, and on this put the top or bottom of a tin fruit can; put a screw down through the tin and spool into the arm; use glue where the braces are joined. Give the whole a coat of black paint, and dust with a little bronze after varnishing, and it will resemble bronzed iron-work, or with bronze and varnish run a fine vine along the arm.

At the point D on the brace, any sawed ornament may be added to make the work look more finished. If a number of brackets are to be made, it will pay best to have the stuff sawed out by machinery, and the screws bent and cut at a blacksmith's—a scroll-saw will be found convenient for any ornaments to be attached to the brace.

WHAT IS TO BE DONE.

1. Child two years old has an attack of croup at night. Doctor at a distance. What is to be done?

The child should be immediately undressed, and put in a warm bath. Then give an emetic, composed of one part of antimony wine to two of ipecac. The dose is a teaspoonful. If the antimony is not at hand, give warm water, mustard and water, or any other simple emetic; dry the child, and wrap it carefully in a warm blanket.

2. Hired girl sprains her ankle violently.

First bathe in cold water, then put the white of an egg in a saucer, stir with a piece of alum, the size of a walnut, until it is a thick jelly; place a portion of it on a piece of lint or tow large enough to cover the sprain, changing it as often as it feels warm or dry; the limb is to be kept in a horizontal position by placing it on a chair.

3. Bees swarm, and the man who hives them gets severely stung in the face.

The sting of a bee is hollow and barbed, and as it contains the poison the first thing to be done is to remove it. The parts stung should then be bathed in warm water, and a little ammonia be rubbed on them.

4. Some one's nose bleeds, and cannot be stopped.

Take a plug of lint, moisten, dip in equal parts of powdered alum and gum arabic, and insert in the nose. Bathe the forehead in cold water.

5. Child eats a piece of bread on which arsenic has been placed for killing rats.

Give plenty of warm water, new milk in large quantities, gruel, linseed tea; foment the bowels. Scrape iron rust off anything, mix with warm water, and give in large draughts frequently. Never give large draughts of fluid until those given before have been vomited, because the stomach will not contract properly if filled, and the object is to get rid of the poison as quickly as possible.

6. Young lady sits in a draught, and comes home with a bad sore throat.

Wrap flannel around the throat, keep out of draughts and sudden changes of atmosphere, and every half hour take a pinch of chloride of potash, place it on the tongue, and allow it to dissolve in the mouth.

7. Nurse suffers from a whitlow on her finger.

Place the whitlow in water as hot as can be borne, then poultice with linseed meal, taking care to mix a little grease with the poultice, to prevent it from growing hard. Bathe and poultice morning and evening.

8. Child falls backwards against a tub of boiling water, and is much scalded.

Carefully undress the child, lay it on a bed, on its breast, as the back is scalded, be sure all draughts are excluded, then dust over the parts scalded bi-carbonate of soda, lay muslin over it, then make a tent, by placing two boxes with a board over them in the bed, to prevent the covering from pressing on the scald; cover up warmly.

9. Mower cuts driver's leg as he is thrown from seat.

Put a tight bandage around the limb, above the cut, slip a cork under it, in the direction of a line drawn from the inner part of the knee to a little outside of the groin. Draw the edges of the cut together with sticking plaster.

10. Child has a bad earache.

Dip a plug of cotton wool in olive oil, warm it, and place in the ear. Wrap up the head and keep out of draughts.

11. Youth goes to skate; falls through the ice; brought home insensible.

Strip the body, and rub it dry; then rub it with a warm blanket, and place it in a warm bed, in a warm room. Cleanse away froth and mucus from the nose and mouth. Apply warm bottles, bricks, &c., to the arm-pits, between the thighs, and to the soles of the feet. Rub the surface of the body with the hand encased in a warm dry worsted sock. To restore breathing, close the nostrils and breathe steadily into the mouth; inflate the lungs till the breast be raised a little, then set the nostrils free, and press gently on the chest until signs of life appear. Then give a warm drink, and put to bed. Do not give up hope for at least three hours after the accident.

12. Child gets sand in his eye.

Place your forefinger on the cheek bone having the child before you. Then draw up your finger, and you will probably be able to remove it; but if you cannot get at the sand this way, repeat the operation while you have a knitting needle laid against the eyelids, this will turn the lid inside out, and then the sand may be removed with a silk handkerchief. Bathe in cold water, and exclude the light for a day.

Sairey Gamp.

THE COCKROACH AND ITS ENEMY.

G. A. PERKINS, M. D.

The instinctive habits of insects furnish no small proportion of the interest which attaches to the study of that class of the animal kingdom. The wasps furnish their full share, and the student of nature never tires of investigating the different methods by which they arrive at the same end,—each species following out the law impressed upon it by the Creator with its very being.

Various species of Vespa deposit their eggs in a paper cell, and feed their young, in a larval stage, with insects, which they chew, and partially digest for this purpose. Another genus (Pompilus) excavates a hole in the sand in which she deposits numbers of flies, spiders, etc., and with them an egg, and, burying them, leaves the larva to select its own food from these materials. Others, such as Pelopæus, the Mud-dauber, place the same materials in curiously constructed cells of clay, and closes them up with the same masonry. Others still, not content with such small game, select the body of one of the larger insects, and deposit in it the germ of their future offspring.

Of this latter class is a beautiful trig little species (Ampulex Sibirica Fabr.), very common in Western Africa, and whose polished metallic body, shining like burnished steel, is familiar to all dwellers on that coast. The Ampulex selects the body of the gigantic Cockroach as the receptacle of its egg, and it is not a little amusing to see in what a business-like and determined manner she sets herself to the task of capturing her victim, and serving her writ of *habeas corpus* upon the doomed roach, full a dozen times her size.

The wasp enters the apartment, and instantly a great commotion takes place among the cockroaches (and their name is legion in the tropics); frantic with fear, they seek a place of greater security, and, in their haste, often rush into the very danger they seek to avoid; for, should the keen eye of the wasp light upon them, the case is a hopeless one. (It is a matter of wonder in what manner the roach should know of the presence of the wasp, and we can only conjecture that its keen perception may distinguish a peculiar sound in the vibrations of the wings of its enemy, as the larger animals are said to in the roaring of the lion.) The wasp flies like fury at the roach, and a severe struggle takes place; both using legs and wings in the fight, the contest is usually a short one, for the wasp, seizing its victim by the head, or front of the thorax, bends its body short round and plunges its sting into the nearest part, and the roach, who a moment before was fighting for dear life, becomes as quiet as a sleeping infant,—not a leg moves. The victorious wasp draws off a few inches, seeming to survey her vanquished foe with pride, then proceeds to brush off the dust from its brilliant coat and wings, and, after pluming its antennæ, prepares to place its prize in a secluded spot. Taking the roach by the head, she leads him away a few feet, and, leaving him, examines the vicinity for this purpose. In one instance, the cockroach was dragged with considerable trouble between the leaden lining of a tea-chest and the outer box; in another, an open-backed book answered her purpose; but the most singular spot was the inside of a door-lock. The cockroach walked slowly up the door to the key-hole, led by the wasp, and, after much pulling on the part of the wasp, was forced into the interior.

After being out of sight a few minutes, the wasp returned, took several nails from a paper which lay on the floor near by, and carried them, one by one, into the key-hole. I could not but admire the perseverance manifested in this effort. The wasp was obliged to walk backwards up the door to the key-hole: the nail could not be turned by the wasp into a proper position to enter endwise, and, consequently, fell to the floor several times before being successfully drawn in, and each time the wasp descended immediately to renew the attempt. The lock was taken off carefully, and *six four-penny nails* found covering the body of the roach.

Not the least singular feature in the case is, that the sting of the wasp does not kill the cockroach, but only stupefies him, so that the roach, when he walks to his final resting-place, may certainly be said to *go to his own funeral as chief mourner!*

The bodies of this species of cockroach are often found with the empty cocoon of the wasp occupying the cavity of the abdomen; the young wasp, having been hatched there, and, after completing its larval stage, spinning this cocoon, still remains there to complete its development, when it comes forth a perfect insect, in all respects like its parent.

To show with what tenacity the wasp sticks to her prey when once within her grasp, we once put a cockroach, which had been paralyzed, with the wasp, in a glazed earthen pitcher, and watched the result. The wasp attempted to lead the roach out of the pitcher, to which move the cockroach made no objections, and walked up the inclined side of the pitcher as far as his feet would permit him, but not being furnished with the little pads or suckers with which our common fly and many other insects are provided, he found it out of his power to comply with the requirements of his master, and on attempting to continue his walk, fell to the bottom. The wasp again led him up, and again he fell. This was repeated for the space of three hours, the wasp, in some of her attempts, nearly sustaining the whole weight of the roach. After being convinced of the impossibility of her accomplishing the feat, I liberated the pair, the wasp soon storing her prize away under a bookcase.

Potato Beetles.

Dear Rural:—"Render honor to whom honor is due," is an old saying, and I think it just and right to give you my experience with the Colorado beetle, or potato bug, this season, as it may be a benefit to others. My neighbors have been using Paris-green to kill theirs. I watched the effects of the stuff and made up my mind that none would go on my potato vines. Seeing an advertisement of the Pest Killer, made at Kearney's Chemical Works in New York City, I sent for a trial box, tested it to my full satisfaction and found it was just what was represented. I then sent for more and have dosed my potato fields effectually, according to directions with the packages. The results are, the bugs are vanquished, my potato vines are bright and green and present quite a contrast to the sorry-looking Paris-green dosed fields, where the bugs still riot on the remains of the vines. S. H. R.

The Puzzler.

HIDDEN TREES.

1. See the cat, Alpa, on the fence.
2. Did you ever pop large ears of corn?
3. Sarah, Em locks her door every night.
4. Pap, awfully blows the wind.
5. I can spell b, a; O, Bob, can you do it?
6. Sew on the button, Woodworth.
7. After churning butter, nuts were cracked.
8. In the arbor Vitaela waited for her lover.
9. Why, Rose; wood stoves are much the best.
10. Jenny Lind entranced her hearers.
11. Mamma gave me a watch.
12. Cal derived benefit from tar drops.
13. Hal, Monday is the day appointed.
14. The moon is in a haze, Lily.
15. Hiram Eir chased the geese.
16. 'Twas a Tobam-book of the Jews.
17. I took Mistle to Elmira.
18. Urban, I angrily denounce you.

☞ Answer in two weeks. Little One.

ENIGMA.

There is a noun of plural number,
Foe to sleep and quiet slumber;
Now, any other noun you take,
By adding "s" you plural make;
But if an "s" you add to this,
Strange is the metamorphosis;
Plural is plural now no more,
And sweet what bitter was before.

Chipmonk Hollow. Rosa A. Frost.

Sabbath Reading.

SHALL WE HAVE A SABBATH?

The season now drawing to a close has been remarkable for the increased disregard of the sacredness of the Lord's Day. Sunday excursions by steamboats, Sunday trains on railroads, Sunday amusements of all kinds, have abounded. Much of this is in an open and apparent contempt of the law, but nobody moves to enforce the law. Appeals are sometimes made for the interposition of the executive authorities to see that this, among other laws, be faithfully executed, but no one regards them. It would be better just to say that the law is a dead letter. An attempt to prosecute ordinary labor through seven days of the week, robbing the employed classes of their rest-day, would be quickly animadverted upon, and, if persisted in, would be held in check by the unquestioned force of the statute. But where amusements are concerned, though they involve a great amount of servile labor on the part of those who provide them, and the means of enjoying them, they are viewed with an indulgence that nothing seems likely to disturb. In the present state of public opinion, the law of the Sabbath is relaxed beyond any known precedent in the United States.

As the cause of a relaxed practice is undoubtedly a relaxation of principle, little can be gained by agitating in favor of a strict enforcement of the law. Agitation alone changes no opinions. It merely brings to the surface sentiments that lay dormant, and puts them in action. But if the desired sentiments have ceased to exist, have given place to other sentiments, or to a feeling of careless indifference, the only effect of agitation will be to expose the vacuum that might otherwise escape notice.

It is a fact of no small importance that the opinions and the habits of religious people have undergone a change for the worse. It is not merely that the opinion formerly held has been reconsidered and modified, for that was inevitable; but that many, having discovered that the Puritan doctrine and discipline concerning the Sabbath were overstrict, having gained no substitute for what they reject. Feeling that they are not bound to keep the day with Judaical restraints, they throw off all restraints except the easy limits of decorous respectability. Now we are not likely to have a legal Sabbath if we have no Christian Sabbath. Every one who has, or means to have, a conscience in the matter should define to himself, in the light of Scripture and good sense, what is a proper use of the Lord's Day, and for himself and his household, if he be a householder, resolve firmly to abide by that. Let Christians set a proper example of keeping the day holy, and then they may, with some hope of success, insist on the protection which the law provides for its observance as a day of rest from toil.—*Watchman.*

"WOULD" MISUSED.

In prayer we often hear such expressions as the following: "We would thank Thee," "We would bless Thee," "We would praise Thee," "We would ask Thee," etc. Some may fall into this habit by hearing others use such forms of speech without reflecting that they thereby reduce their thanksgiving and supplications to almost meaningless expressions. Others may have adopted it because it appears to them to savor of humility; as if it were almost presumption in them to bless or entreat God at all. But surely this is no honor to Him who has taken such pains to open the way to sinners to His throne, and invites them to come so freely. If any are so suspicious of the state of their own hearts as this seems to imply, it were far better to ask God to give them a devotional spirit than to use a form of words which implies that they do not at all what they profess to do. The expressions, "We would bless Thee," "We would confess to Thee," mean simply, "We should be glad to do this, but somehow or other, we can't or don't." And I often felt, while hearing such addresses to God, that he might say to offerers, "If you wish to praise Me, and ask favors, *why don't you do it?*" I pray you, dear brethren lay aside these unsuitable and harmful forms of expressions. If we have only such would-be worship to offer to God, we are miserable Christians and undevout ministers, for this habit sometimes invades the desk. Christ did not say, "I would thank Thee, O Father, Lord of heaven and earth;" but, "I thank Thee." Let Him be our pattern.—*Interior*

If a tree do not bud, blossom and bring forth fruit in the spring, it generally is dead all the year after; so if in the spring and morning of your days you do not bring forth fruit to God, it is a hundred to one that you bring not forth fruit to him when the evil days of old age shall overtake you, wherein you shall say you have no pleasure; for, as the son of Sirach observes, "If thou hast gathered nothing in thy youth, what canst thou find in thine old age?"

Cold prayers are like arrows without heads, swords without edges, birds without wings; they pierce not, they cut not, they fly not up to heaven. Those prayers that have no heavenly fire in them always freeze before they reach as high as heaven; but fervent prayer is very prevalent with God.

Many take unfit seasons for private prayer, which more obstruct the importunity of the soul in prayer than do all the suggestions and importunities of Satan.

PERSONAL ITEMS.

Henry M. Stanley still suffers from his African fevers, and at times despairs of ever getting rid of them.

Sir Charles Dilke was recently asked how his house had fared during a storm. "Oh, badly," was the reply; "my cistern is the only dry place in it."

The next batch of English peers, they say, will include Mr. Beresford Hope, Mr. Baillie Cochrane, Mr. H. Chaplin and Mr. John Walter, of the Times.

Mr. Murat Halstead, of the Cincinnati Commercial, is the happy father of a round dozen of children. His youngest heir was born a few weeks since in Paris.

The monument to Liebig to be erected at Munich, Bavaria, will consist of a bronze statue on a handsome pedestal. About $20,000 have been subscribed toward it.

The longest funeral Memphis has had since the epidemic broke out was that of Mr. N. D. Menken, a Hebrew philanthropist, who died a day or two since. There were "one hack and three buggies."

Taglioni is a fine-looking and graceful old lady of 70. Until very lately she gave lessons in dancing and deportment in London to the daughters of "the nobility and gentry," but this is now beyond her reach.

The father of Tom Thumb is a pauper in the Chicago Poor House. Tom quarreled with him when a boy, and has never visited him since. He has fourteen sons and daughters in all, several of whom are wealthy.

Wilkie Collins is almost an invalid, and suffers a great deal with rheumatic gout. He speaks of the gout with stern disapprobation, but, despite the pain it almost continually inflicts upon him, he talks admirably upon nearly all topics.

Prof. Charles Crandall of Cornell University, was married to a blind lady, Miss Jemima Robbins, at Bridgwater, N. Y., lately. They had been playmates and schoolmates through early life. Miss Robbins lost her sight through excessive study.

The house in which John Knox, the Scotch Reformer, lived and died is yet standing in that part of Edinburgh known as the Old Town. Extending over the entire front is this inscription in large Roman letters: "Lufe God abufe all, and yi nychtbour as yi self."

The Rev. Augustus Toplady, author of the favorite hymn, "Rock of Ages," was rector of Broadhembury, in Devonshire. Often, instead of going to bed, he would put on his surplice, go out of doors, and thus attired, walk for hours in the night singing hymns.

The Prince of Wales' eyes are gradually becoming bulbous or crow's-footed. This is not caused, as is supposed, by violent dissipation; it is simply an heirloom of the Guelph family. Albert Edward is in every way a reformed man, which is only right for one blessed with five nice children.

Richard Grant White is at least in perfect harmony with the rest of the English-speaking world on one solitary phrase. In common with the most cultured and most illiterate of the land, he says, "My baby is teething," and in triumphant disdain asks for the man or woman who would dare say, "My baby is being toothed."

Mr. Edison's peculiarities were strikingly illustrated recently as a plaster cast of his head was being taken. While the work was in progress he employed his time in experimenting as to the sound conductivity of the wet and drying plaster, and in communicating with those about him by a telegraphic instrument which he could not see.

Congressman Hale and Mayor Boardman of Belfast, Me., went out the other day to attend a hard-money meeting. Not being sure of their way, they applied to Captain Baker, a Greenbacker, for information, and Captain Baker gave them such directions that they were unable to reach the ground till long after the meeting was over. When they returned with all their speeches in them, Mayor Boardman sought out Captain Baker and smote him upon the nose.

Post Master-General Key stands over six feet high, and is broad-shouldered, muscular, and solidly built. He would, at a rough guess, turn the scales at 250. His face is of rather a leonine order, and his large head is surmounted by a plentiful growth of bushy hair. Gray whiskers and a pair of keen brown eyes, a kindly expression of countenance, a hearty voice, large hands that give a cordial, vigorous Western "shake," and a manner unaffected and genial, complete the picture.

It has been said that the ex-Empress Eugenie is poor. Such is not the case. Her large fortune is invested in English consols, and the interest she derives amounts to $500,000 per annum. During the Emperor's life-time all the money he could scrape together was forwarded either to Poole, the tailor, or to the Bank of England. Camden House, Chiselhurst, was given rent free to her ex-Majesty by its liberal owner, and there she lives in good style, with a retinue of some fifty persons, and carriage and saddle horses numbering over twenty.

Editor Labouchere of the London Journal, Truth, should be a happy man. He is defendant in five libel suits—one brought by a man whom he called a swindler and card sharper; one by Manager Robertson of the Royal Aquarium, whom he called a thief, liar and defrauder of the Aquarium Company; another by a director of that company, whom he accused of abetting Robertson's frauds; still another by Miss Lytton, alleged wife of Robertson, who he asserts is no actress; and the fifth by an oriental correspondent of the Telegraph, whom he attacks as a rascal. To one and all he opposes the defense that he tells the truth.

Implements and Machinery.

SULKY PLOWS.—THE SUBSCRIBERS are the only manufacturers of

OSBORN'S SULKY PLOW,
the only Plowing Machine that has proved a perfect success in all kinds of soil. Any kind of plow can be attached. The plowman rides and handles the plow with ease, regulating the depth and width of furrow. The draft for the team is materially less, and the ordinary laborious mode of plowing is reduced to one of comfort and ease.
THE MEADOW KING MOWER,
and other Agricultural Implements.
GREGG & CO.,
Trumansburg, Tompkins Co., N. Y.

Established 1845.

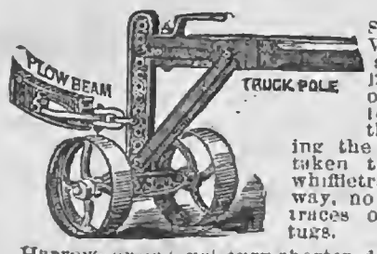
—WOODEN WATER PIPE—
Always on hand and made to order.
Also, Chain Pump Tubing and the Rubber Bucket Pumps. Send for Circulars.
H. H. BABCOCK & SONS, Watertown, N. Y.

Implements and Machinery.

THE PARKER GUN.

THE OLD FAVORITE. No gun in the world has a better record for close, hard shooting, and none will stand more hard service. AN AMERICAN GUN FOR AMERICAN SPORTSMEN. Send stamp for circular to PARKER BROS., Meriden, Conn., 97 Chambers Street, New York.

IMMENSE SUCCESS.
The HARRIS Farm Truck!



Saves the Gage Wheel, half the labor of holding, 12 to 15 per cent. of the draft. Team can back the plow, no riding the beam, plow taken to the field, whiffletrees out of the way, no stepping over traces or letting out tugs.

Harrows draw level, turn shorter, do ¼ more work. Holds Shovel Plow, prevents jumping and dodging. On Scraper saves man and team. Handles never get muddy. Will pay its cost in one week.
Just the thing on Stone Boat, Horse Fork, etc., etc.
Hon. Harris Lewis, Pres. N. Y. D. A., says: "The best farm implement for the money, he ever owned."
Prof. Arnold, Sec. A. D. A., says: "It will be considered an indispensable addition to the list of farm implements when once tried."
Hon. T. F. Randolph, U. S. Sen. from N. J., says: "It is desirable because of its simplicity, effectiveness and economy."
Great inducements to one responsible Canvasser or Agricultural Dealer in each town.
Where no agency is established a Truck will be sent freight prepaid, upon receipt of price. Send for testimonials. Price, Farm Truck, $6; Thills, extra, $2.
SAXTON & AMIDON, Manufacturers,
MILO HARRIS, Gen. Agt. Buffalo, N. Y.

Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one.
Address, P. K. DEDERICK & CO., Albany, N. Y

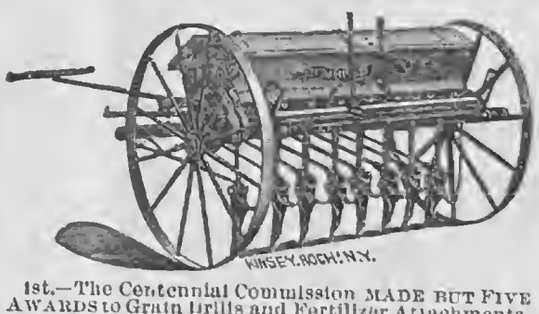
WHEELER & MELICK CO.,
ALBANY, N. Y.
Send stamp for Circular and report of Centennial trial.

FACTS FOR FARMERS.



1st.—The Centennial Commission MADE BUT FIVE AWARDS to Grain Drills and Fertilizer Attachments.
2d.—Of these five, TWO were given Buckford & Huffman. One on the FARMER'S FAVORITE and one on Fertilizer Attachment.
3d.—NO OTHER MANUFACTURERS RECEIVED AN AWARD ON A FERTILIZER ATTACHMENT!
4th.—The award to the "Champion," built by Johnson, Gere and Truman, was "for a machine with attachable manure distributer;" an implement they did *not* exhibit and *do not offer for sale*, as their "manure distributer" is neither "attachable" nor detachable. The report does *not* commend this drill or its "manure distributer," for a single quality of work.
5th.—The award to the Farmer's Friend pronounces it defective by saying *it is capable of further improvement, as regards delivery up and down hill*; and also to the McSherry drill in these words: "*Some further adjustment appears desirable to enable this drill to deliver with equal equality up and down hill.*"
6th.—The Empire, Buckeye Hoosier, Superior and Hagerstown drills were *refused* EITHER AWARD OR REPORT, because of great "irregularities" or "variations" in the tests.
7th.—The variation of our nearest competitor. The Champion, *from its own distribution*, was MORE THAN 23⅞ PER CENT. of that shown by the FARMER'S FAVORITE.
8th.—The award to the FARMER'S FAVORITE, distinguished it by commending it for "ACCURACY OF DELIVERY, AND REGULARITY OF DISCHARGE UNDER DIFFERENT CONDITIONS," and "REGULARITY OF DELIVERY UNDER ALL CONDITIONS." Qualities conspicuously lacking in its competitors.
We challenge contradiction of a single feature of the above statements.
Fully 80 per cent. of all the Fertilizer drills in use on the American Continent are built under our patents,—a fact that tersely and undisputably establishes superiority. For circulars, prices of information see our agents, or address Buckford & Huffman, Macedon, N. Y.

New Publications.

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose, WE ISSUE SEMI-ANNUAL EDITIONS OF
AYER & SON'S MANUAL
FOR ADVERTISERS, 164 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of 25 cents by N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

Wit and Humor.

"Our minstrel boy to the West has gone,
In the City of Pork you'll find him;
His classical pearls he has girded on,
With his orchestra slung behind him.

'Gothamites!' said the frate bard,
'I leave thy halls forever:
My musical steed I have ridden upon,
But you would not stand and deliver.'"
[*N. Y. Commercial Advertiser.*

THE musquito, like charity begins to hum.

A STANDING choler—that of Gale Hamilton.—*Rockland Courier.*

"CAN storied urn or animated bust" exceed in eloquence, "No Trust?"

DENNIS KEARNEY is rapidly becoming the horny jaw-boned son of chin.—*Baltimore Gazette.*

THE worst thing about a mosquito is its long soliloquy as to where and when it had better settle down and bite.—*New Haven Register.*

Mary had a little lamp,
'Twas filled with kerosene,
She blew right down the chimney
And vanished from the scene.

WHAT straits are the most perilous? asked the Sunday school superintendent, and a little boy spoke up promptly, "whisky straights!" And the boy was right.—*Cin. Sat. Night.*

A CORRESPONDENT of a New York daily suggests the use of donkeys in polo playing instead of ponies. We had supposed that donkeys took part in the game all along—*Turner's Falls Reporter.*

SUBSCRIBER wrote to a journal to make some inquiries about the next world's fair, whereupon the wicked editor replied that he was under the impression that the next world wouldn't have any fair.

"SPEAKING of bathing," says Mrs. Partington, "some can bathe with perfect impurity in water as cold as Greenland's icy mountains and India's coral strands; but, for my part, I prefer to have the water a little torpid."

THE sun rises in the east," explained the teacher. "Yes, an' there's southin rises in the west, too," chimed in one of the smaller boys. "Well, what is it?" asked the school-ma'am. "Injuns!" shouted the urchin.

SAID an Irishman, in the course of an eloquent speech, "Mr. Chairman, the gals is the boys to do it."

There is no picnic ant, however lowly,
That for a livelihood must toil and beg.
But lifts the largest man up, grandly, slowly,
When it goes browsing up his trouser's leg.

There is no little bee, however humble,
That gathers summer's sweets for winter's store,
But has, by prodding with his tiny bumble,
Made great men writhe and howl, and groan and swore.

WE met a farmer, a day or two ago, who was so hard pushed that he was on his way to pawn his hoe. We told him we were sorry to see his case so hopeless. "Hopeless!" he exclaimed; "far from it! You know the old motto, 'hoe-pawn, hope ever.'"—*Yonkers Gazette.*

A magazine writer says there is a language of the hair. Don't doubt it in the least. At any rate, we have heard of tolerably well authenticated cases where a single auburn hair on a dark coat-collar, could talk plainer than a gnide-board, and furnish the material for a whole course of lectures.—*The Nation.*

AN irascible old gentleman who formerly held the position of Justice of the Peace, was recently accosted in the street in a manner that did not come up to his honor's idea of the respect due to him. "Young man," said he, "I fine you twenty shillings for contempt of court." "Why, Judge," said the offender "you are not in session. "This court," replied the Judge, "is always in session, and consequently always an object of contempt."

LIKE all Rome urchins, a Liberty-street youth, just ready for his first trousers, is familiar with Bible history and careful of his playthings. The other day he asked his mother whether David, who killed Goliath, had taken good care of his playthings. "Oh, certainly," responded the encouraging parent. "Well, said the ambitions youth, "the reason why I asked was, I would like to borrow David's sling, if his folks are willing."—*Rome Sentinel.*

Prompt Reform of Bodily Evils.

The prompt reform of those bodily evils, enfeebled digestion, incomplete assimilation, inactivity of the liver, kidneys and bladder, as well as of the nervous symptoms which these ailments are especially prone to beget, is always accomplished by the use of Hostetter's Stomach Bitters, a medicine accredited by physicians, pronounced pure by analysis, and eminently wholesome and agreeable. Surely such a restorative is preferable to unpalatable and indigestible mineral drugs and unsanctioned nostrums. The nation at large assuredly think so, judging by the unprecedented demand for the article from Maine o the Pacific, a demand now supplemented by immense orders for it received from tropical America, Mexico, the British and Spanish Colonial possessions, and elsewhere. Both at home and abroad it is recognized as a standard remedy and preventive, the decisiveness of its effects recommending it everywhere.

SYLVIA.—"There go Uncle George, and Aunt Mary, and the Baby! What a fuss they make about that Baby, to be sure!"

DAISY.—"People always make a fuss about their first-born, and always have ever since the world began."

SYLVIA.—"I don't suppose Adam and Eve made much fuss about Cain."

DAISY.—"Why not?"

SYLVIA.—"Well, they'd never seen a Baby before, and must have thought him quite an idiot!"

Rural Architecture.

A THOUSAND-DOLLAR SUBURBAN HOME.

PALLISER, PALLISER & CO., ARCHITECTS, BRIDGEPORT, CONN.

THE Cottage here illustrated was designed with special reference to meeting the requirements of a family of moderate means, and gives them, for an outlay of one thousand dollars, the necessary rooms and conveniences as well as the comforts of a real home.

The designing of small houses as suited to the masses of the country at the present time, has been very much neglected by the well trained and capable members of the architectural profession; and those requiring cheap homes have been obliged to call in the services of the builder to assist them in their planning, hence the unsightly and meaningless architecture that abounds in our suburban and country districts. But the time is past when people thought that tasteful designs and convenient plans must necessarily be expensive, and the best architects have waked up to a realization of the fact that the planning of a workman's cottage is not unworthy of their skill, and that there is a constantly improving and popular artistic taste to be catered to; hence we may naturally expect better principles both in construction and external appearance, for truth and beauty, good taste and artistic excellence, are not the exclusive possesions of the rich, and the modest suburban home of the mechanic or business-man may as well be neat and attractive externally and convenient in its internal arrangements as ungainly and comfortless.

In the accompanying design we have three rooms on the first floor, together with front hall, pantry and large closet; the stairs to the cellar are accessible from the kitchen, and the open fireplace in the living-room is an important feature. On the second floor are three spacious chambers, each having a good closet; also, there is a small closet in the hall. There is a cellar under the whole house; the hight of cellar in the clear is six feet six inches; first story nine feet; second story eight feet. Roofs are shingled with fine shingles laid five inches to weather, the frame is sheathed with tongued and grooved boards, and inclosed with narrow clap-boards three inches to weather. The whole is built in a thoroughly substantial and complete manner for price named above.

The painting of exterior is in tints, the exterior body-color being Venetian red with trimmings of Indian red, and chamfers and incised work picked out in black, blinds dark-green.

It costs little to have an artistic building if one begins aright, and while a square box may suit the taste of some, the fact is certainly to be deplored. A neat artistic building for a rural home, is a pretty certain indication of comfort and self-respect in its inmates. The house will be furnished neatly if not expensively, to accord with its external appearance; the grounds surrounding it will be pleasantly laid out, and the whole farm bear evidence of care and thrift.

Farm Economy.

REQUIREMENTS TO BECOME A GOOD FARMER?

L. J. TEMPLIN.

A CLEAR CONCEPTION OF MODERN FARMING.

How may I become a good farmer? is a question that many young men are asking themselves at the present time; and for the want of a satisfactory answer to it, many are hesitating about engaging in farming pursuits at all. It is a question, the importance of which is not appreciated by a great number of those already in the business. Too many farmers are content with the old, humdrum routine of farm work pursued in the same manner it has been for generations past. Such was probably good farming in the days of our fathers or grandfathers; but such is not good farming to-day, any more than the old-fashioned stage would be a method of fast traveling at the

A THOUSAND-DOLLAR SUBURBAN HOME.—[See page 615.]

present time. The methods of farming in vogue at prosent aro based upon and demand a much higher degree of intelligence than was demanded in former times. Farming is no longer simple muscular drudgery as it was in the days of our fathers. The first thing, therefore, for a young man who contemplates engaging in agricultural pursuits, is to rise to a proper conception of the true nature and dignity of his calling.

PRACTICAL KNOWLEDGE.

It is true, however, that in farming there is more or less hard manual labor that cannot be dispensed with. Many things pertaining to the minutiæ of farm work, and that must be known in order to win success in the business, can be learned only by observation and experience. Reading and study are important, indeed indispensable, to the highest success, but neither of these will take the place of actual contact with the active duties of farm life.

Apprenticeship is what is needed to qualify young men for this work. In the mechanic arts no one thinks of entering upon a successful career without having first served a protracted apprenticeship under a competent and skillful workman. Now, there is as much to be learnt about farming as there is about any of the mechanical trades. The better plan is for the young man who would excel as a farmer, to place himself for a few years under the instruction of a first-class, practical farmer. In this way he will be able to learn just how every operation on the farm is, or should be, performed. At the same time he will acquire skill to perform these operations himself.

Our agricultural colleges are, or should be, the best places in the country for obtaining both a practical and theoretical knowledge of agriculture. Whether these institutions are doing all that the people have a right to expect of them, is a question that I do not intend to discuss at this time, but there is no doubt that any one of them will be a great assistance to anyone who is seeking to qualify himself for the business of farming. Where a young man can avail himself of the opportunity to attend one of these institutions, he should do so by all means. But if this may not be done, the next best thing is, as I have stated, to serve under some first-class, practical farmer till the practical farm work is thoroughly understood.

KNOWLEDGE OF THE PRINCIPLES OF CORRECT FARMING.

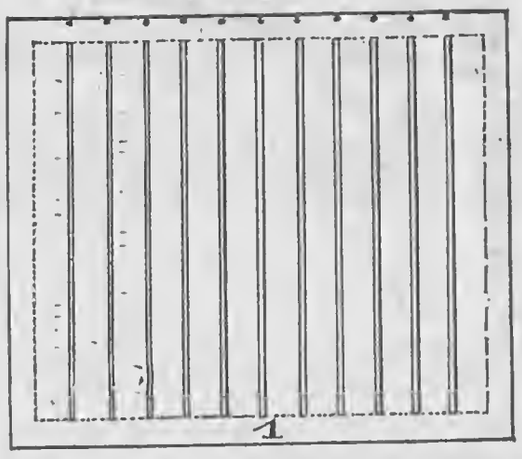
But practice without a knowledge of principles leads to a one-sided, unsatisfactory course. Provision should, therefore, be made for a thorough study of the principles on which correct farm practice is based. The young man who wishes to qualify himself for taking a high rank as a farmer, will find a great assistance in the agricultural periodicals of the country. These are largely made up of the writings of practical farmers, and hence contain the ripest thoughts and latest results of the most successful farmers of the country. Every young farmer should take and read, with care and close attention, one or more—I would say two or three—of these publications. Besides these, a small library of choice agricultural books should be procured and thoroughly studied. These should embrace works on soils, crops, fruit raising, entomology, agricultural chemistry, the breeding, raising and fattening of stock, meteorology and other kindred subjects. Inasmuch as a large portion of farm work is now done with machinery, the study of mechanics is an essential part of a good farm education.

Let any young man who is asking the question that heads this article, pursue faithfully and persistently the course here recommended, and, if he is a man of even mediocre ability, he will, in a few years, be able to take rank with the most intelligent and successful farmers of the country.

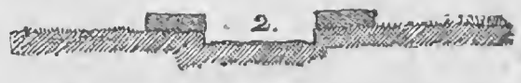
THE SCIENCE AND PRACTICE OF PLOWING

BY A JERSEY FARMER.

The object of plowing is to prepare a fit bed to receive the seed and for the proper growth of the roots. These include every purpose for which a farmer uses a plow. As has been explained in a former article upon the culture of wheat, a proper condition of the seed-bed is very important and absolutely necessary for safety and thrift of the young plants. This condition should be such as to secure a certain mellowness and looseness of texture, and yet a certain compactness of the soil in every portion a field. If it is necessary anywhere, it is as needful everywhere. Upon this evenness of preparation, more depends than is generally supposed. It is precisely here that failure is most frequent. Perhaps there is no other country where agriculture is practised as an art, where less attention is given to perfection in plowing or where there is less system in the mechanical preparation of the soil for the seed. One very rarely sees a straight, even furrow; or a plowed field in which a stick can easily be thrust to the depth of the furrow all over the field. When tested in this way, there will usually be found, at least once out of three times, a place where the stick will not penetrate more than an inch or two instead of five or six inches. These hard spots have not been plowed. The ground has there been passed over by baulks, or by crooks in the furrow; or the plow has merely skimmed over the surface; or the furrow slice has been lapped over too much; or it has not been cut off below the surface by permitting the plow to take too much land. Plowing is an art that requires both study and practice for its proper performance; and many old farmers, all the young ones, and those who are not "to the manner born," who have taken to the farm either as an escape or a relief from other employments; all these may well and profitably study the principles, and practice the methods of the art carefully and patiently.



There are plows and plows, some good, some indifferent, and some actually bad; with the last of which an expert plowman must needs exert all his skill to make passable work. There are plows also which are intended for certain uses and which can only be made effective for those uses; as, for instance, plows for lap furrows and for flat furrows in sod; for stubble ground, for side-hill plowing, for broad, narrow, deep and shallow plowing, so that few farmers can do all their work with one plow. There are plows which in the hands of a good workman can be made to do all the different kinds of plowing in a passable manner, but just as an expert cutler or barber could make a jackknife fit to shave a beard with, so with such a plow there are needed the thorough knowledge of what should be done and the skill to do it: of this, however, there is not time to speak: the present object is to refer to the different kinds of plowing and the methods of managing the plow to perform these.



Plowing sod is the most important, because the ground must not only be turned over, but the sod must be covered, the slice must also be turned over evenly, of an even thickness and width. This cannot be done unless the first furrows are made straight and the succeeding furrows are kept straight. The first furrows, too, must not be simply turned over, as is usual, upon the untouched sod, else there will be a ridge left there with a hard bottom under it and much ground will be left in bad condition for the crop. In laying out the lands for plowing, the first furrows should be made straight by the use of sighting poles; experts may do without these, but no young plowman can or should. These are placed about 20 feet apart. The first land should be laid out parallel with one side of the field and the others should be measured from this. The field would then be laid out for plowing as shown at fig. 1. The dots represent the sighting poles with the back furrows, 44 feet apart, plowed across the field.

Those are placed at measured distances; two being placed at the beginning, 44 feet apart, to make 22 pace lands, and each being moved alternately to save labor. Those at the farther end of the furrow are moved before the returning bout is made in readiness for the next furrow.

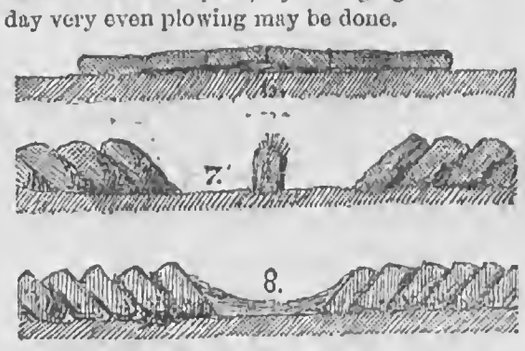
The back furrows for each land are all made before the lands are plowed. They are made as follows: a thin furrow slice is first turned outwards, and in coming back, another is thrown from that also outwards, as shown at fig. 2. Then a deeper furrow is made, which not only replaces the first sod turned, but throws a slice upon it, leaving it as shown at fig. 3. The back furrow then consists of two thin sods face to face, with the earth broken, loosened, and pulverized.

The plowing then continues, leaving the furrows as shown at fig. 4.* The way in which the earth is loosened in the process of turning the sod is shown at fig. 5. First the slice is cut off by the plow-share; it is then raised, and as the mold-board turns it, it is curved and bent, and the loose side, being the outer curve, is spread and broken up, so that when it falls over, it is loose and mellow. There are plows made with long, spreading mold-boards, which turn the furrow-slice slowly and press it hard up against the preceding one and pack it closely; others with short, sharply-curved mold-boards, turn the furrow quickly, and break up the soil more thoroughly. The former are preferred by English and Scotch plowmen; the latter are favored in America and for our dryer climate are preferable, giving a loose, open surface with a compact bottom under it. This kind of plowing is known as lap-furrows, and is suitable for fall crops or for fall plowing for spring crops.

For spring plowing, especially for corn, flat furrows are generally made.† These flat furrows are cut of such a thickness and width that they are not left standing partly upon edge as the lap-furrows, but one is reversed in the furrow left by the plowing of the former one. To do this perfectly, or indeed at all well, the slices must be of even width and, unless the furrows are kept straight, it is obvious that this cannot be done. In short, it is clearly seen that if the plow is not carried at an even depth and the furrows are not kept straight, the work cannot be well done, as there must be places left unplowed; furrow slices not turned completely; gaps left between them into which the seed falls and is lost, being covered too deeply; and that when the ground is harrowed, the sods, being loose, and not properly laid and held down by the succeeding slices, are torn up and left upon the surface. In finishing the open furrows between the lands, the plow should be run back and forth to mellow the soil, and no part of it should be left unplowed. These are frequently left as shown at fig. 7, when they should be finished as at fig. 8.

To make a straight furrow, the plow should be firmly held, the plowman standing well up to the handles, and the handles kept level. The plowman should also keep his eye ahead of the team occasionally, and watch the furrow-slice as it is cut by the coulter or the fin of the share. The moment any divergence from a straight line is seen, the young plowman should stop the team, unless he can rectify the error without, and start again properly, backing his plow if needed. If the plow cuts too wide or too narrow, this may be remedied by changing the draft-point to the left or right, as the case may be. The most convenient way of doing this is by using a clevis in which there are adjusting holes for this purpose as well as for regulating the depth. But for temporary adjustment, the plow may be made to cut wider by carrying the handles to the right hand, and narrower, by carrying them to the left from an even position. This may do to correct a little divergence from a straight line in the former furrow, but should be done only by practiced plowmen. If a furrow will get crooked in spite of all that can be done by a beginner, it will be better for him to go through the last furrow once more and straighten it; and then go on afresh. But it is much easier to get the furrows more crooked with every bout than to get them straight, once the line is departed from.

The depth of the furrow may be changed by altering the position of the clevis up or down in the notches at the plow beam; by changing the length of the trace chains or, temporarily only, by raising or bearing upon the plow handles. The shorter the traces the shallower the plow will run, and as they are lengthened the plow will run deeper. If the point of the share is worn round on the under side, the tendency is for the plow to run shallow, or even out of the ground. The point should be kept sharp for this reason. Movable and reversible points are made, for one plow at least, which are very useful in this respect; by changing them each day very even plowing may be done.



To become an adept in plowing, as every young farmer should aim to be, practice is required. When the writer began to plow, he began in a stubble field, with the sighting poles, until he could turn a straight furrow across the field. It was only a few days until a straight furrow could be made with the use of one pole. Some distant object, a tree or a fence post, answering the purpose of the other. In less than a week's practice it was perfectly easy to manage the plow so as to make a furrow so straight that a rabbit or a crow could be seen from one end to the other, and that will do for all practical purposes. It is to be regretted that we cannot have plowing matches in which farmers' boys could show their skill with their plows and teams. It would tend to very much better plowing, to the growing of better crops than are now produced, with less labor in cultivating them. That nobody can deny.

* It is a good practice to leave a strip—shown by dotted lines, fig. 1—entirely round the field unplowed, until the lands are finished. The width of the strip is such as will give headlands wide enough to turn upon. This is about 10 to 12 feet. When the lands are all plowed, this strip is then plowed by going around the field finishing at the gate, where the last land should have been completed.

† The first furrows are made, as before described, by first plowing shallow slices outwards, then reversing them with a deeper furrow and then proceeding. This is shown at fig. 6. The lands are laid out as before described.

BURNED EARTH AND PEAT.

The simple process of burning a thing in the usual way, is the readiest and most complete destruction of every valuable or injurious ingredient in any article, and when it is desirable to get rid of a thing with the least possible trouble, or to derive the least benefit from it, the quickest and most effectual way of doing so is to bury or burn it. In burning, the good and the bad are etherealized and sent off into the atmosphere to gather in clouds and vapors, and return to the earth in snow and rain as ammonia or other life-giving ingredients of vegetation.

But when all these ingredients which are thus thrown off in open burning, can be retained or stored up, the best fertilizing elements are still retained, and although the residue is not as valuable as if the same article had been properly decomposed and all its ingredients saved, still for many purposes the closed burning process is the most desirable. Such is the case with burned peat or muck and earth, when wanted as absorbents or deodorizers. The great value of these when burned is that, besides retaining nearly all their value as fertilizers, they have added to them the ingredients of the other materials used in burning, and are the best deodorizers for cess-pools, stables, hen-houses, and also the best absorbents of liquids, which the farmer can easily obtain.

But the burning process must be carefully attended to, and consists in covering any convenient refuse matter completely, after the manner of a charcoal heap, with peat or dirt, and letting it burn slowly. Brush, weeds, old decayed timber, corn stalks, or any other material that can be easily obtained, and which, from its coarse character, cannot conveniently be composted in the manure-heap, may be thus profitably treated. In the operation, the earthy covering will absorb the fertilizing ingredients of the smoke and ashes of the refuse heap. No smoke should, therefore, be allowed to escape, except that passing through the muck or earth, and these should be thoroughly pulverized and kept dry, as they are then most effective, and can be most conveniently applied. The muck, peat, or earth is not entirely reduced to ashes, nor is it desirable that it should be, but it is thoroughly dried, while all its sourness is removed and enough potash added to render it more valuable in the compost heap. In this condition it is an excellent absorbent of liquid manure in the stable or cess-pool, and a first-class deodorizer in water-closets, hog-pens, or poultry-houses; and, in fact, is useful wherever any bad odors arise, or where liquid manures would otherwise be wasted. A barn-yard having a water-tight basin in the center, will, if this burned dirt is regularly added to the manure-heap, and removed as often as saturated, furnish an immense supply of the best manure.

LAY IN YOUR WOOD.

[The following article was received from Mr. Miner a few months previous to his death, and held over that it might be more timely.—Eds.]

No good farmer will neglect to cut wood the coming winter, to be used a year hence, as it is poor management to burn green wood; and it is always best to have your wood for your family's use to be under cover, and so connected with the house that it can be got at from the kitchen without going out of doors. If your wood-house is of ample size, it will afford you a place to do many little jobs in rainy weather, and your boys can split the wood under it, and pile it up on wet days. When I see a farmer's wood pile at his kitchen door—a lot of logs to be cut as the wood is wanted, and *green* at that, I know his entire character; and I might write it out thus: This man was brought up from boyhood to be slack in his farm duties, doing nothing but what he could not well omit. He has no idea of there being any benefit in "*driving things*," and he takes the world "easy." He denies that there has been any progress made in farming since he was a boy; consequently, his farm, buildings, and general surroundings have an ancient look, just as farms had fifty years ago; and his children are growing up to be "chips of the old block," and his boys will, probably, die as their father will, with a *pile of green wood at their doors*.

If a farmer has no other reason why he should provide dry wood for his family, except that it is cheaper than green wood, as regards the heat given out, that alone ought to be sufficient inducement for him to provide it; but the comfort of sitting by a dry-wood fire in winter of itself ought to stimulate every farmer to have an ample-sized wood-house, filled with a year's supply of wood, and cut of the size suitable for use, as having to cut and split wood daily, as it is used, is a way of managing fuel that no good farmer should tolerate.

Field Crops.

THE CULTIVATION OF SORGHUM.

THE continued high price of sugar coupled with the fact that the United States import $75,000,000 worth annually, gives importance to any effort which may, in part or whole, tend to supply this deficiency. One of the means of increasing the supply of syrup, if not of sugar, is the cultivation of the sorghum plant, Sorghum saccharatum, now extensively introduced all through the central Western States. Two species of this cane have been introduced, the true sorghum from China, and another from Africa, called Imphee; but this is of less value for cultivation.

Sorghum was first introduced into France in 1851 and into the United States in 1856, since which time its use has extended quite rapidly; machinery for grinding it has been provided, and the process of cultivation and evaporation has become well understood. Sorghum grows on any ground suitable for corn, but well repays high fertility. The plant resembles Indian corn before its seed-clusters come out, and grows to a hight of from eight to eighteen feet. The cultivation is the same as for corn; the stalks are cut just before frost, the leaves stripped off for fodder, and the stalks pressed.

Well-ripened stalks yield half their weight in juice, and from five to ten gallons of juice are required for one gallon of syrup. The yield of syrup averages from 150 to 175 gallons per acre, though in exceptional cases, the yield is much larger. The product is chiefly in the syrup or a glucose used as a substitute for sugar in candies, wines, and for similar purposes. The product varies much with the cultivation and care in manufacture. The syrup carefully made from ripe stalks has a clear, bright, amber color, and is preferable to common molasses. The total amount of sorghum molasses produced in the United States in 1860, was 6,749,123 gallons, and in 1870, 16,050,089, since which time the product has probably further increased in the same proportion.

Some growers recommend cutting off two to three feet of the top before the seeds are fully ripe, which gives a fuller ripeness to the stalk, and the part cut off makes better fodder. This fodder is of about three-fourths the value of the same weight of hay. The cane may be crushed between horizontal rollers as with sugar-cane, but where only small fields are raised, an upright mill, run by horse-power, is usually employed. The total cost of an outfit should not exceed $200.

The fresh juice has a greenish-yellow appearance, and an unpleasant odor or flavor, which is remedied by the use of slacked lime and constant skimming during evaporation. When evaporated to a density of 18° Baume, it is settled and again boiled to 35 or 40 degrees. If the herbaceous flavor has not entirely disappeared, fresh additions of slacked lime are made and it is again boiled. Experiments are now being made to perfect the crystallization of sugar from this source, and it is hoped the cultivation of sorghum may become much more widespread than at present, and that the production of sugar may in this way be profitably transferred from the tropics to the temperate zones, and from slave to free labor. Certainly the inhabitants of the United States should make every effort to extend the production of sugar within their own territory and save the annual expenditure of $75,000,000 now paid to other nations for sugar.

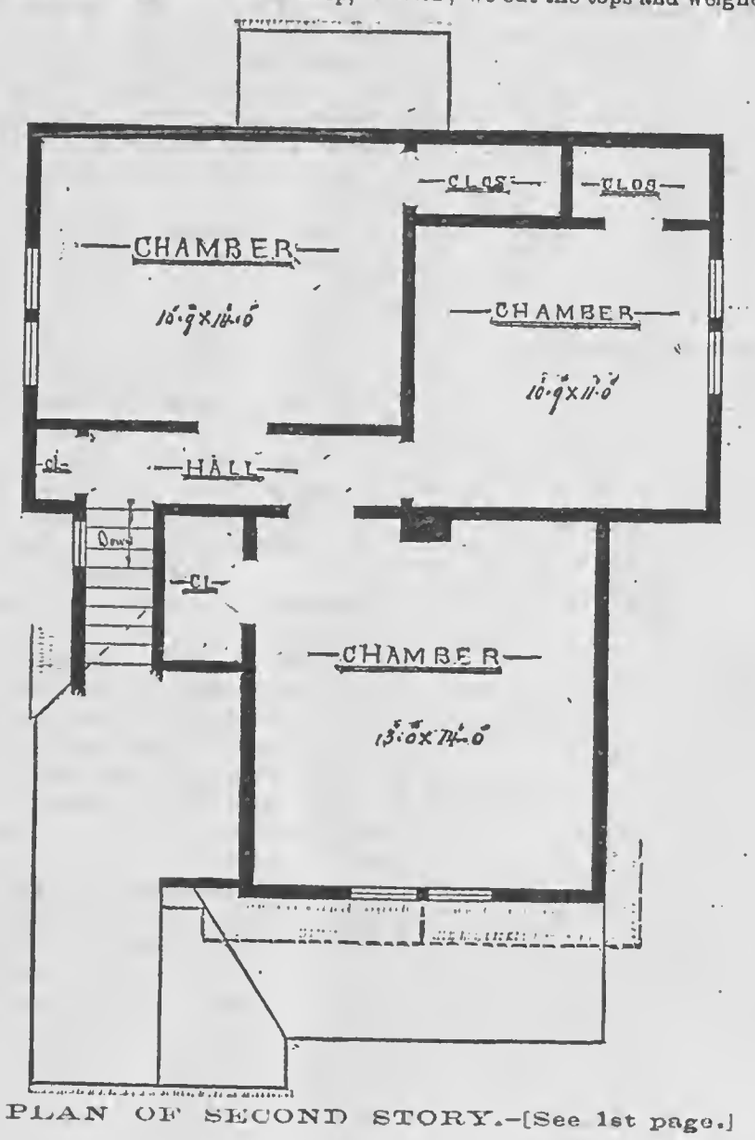
S. S. B.

HARVESTING BEANS.

THE work of harvesting beans is slow, tedious and laborious. If bad weather comes while the crop is exposed, there is the additional danger of its making the beans unsalable. A dry time is important, but at this season we cannot always be sure of dry weather. Beans left on the ground after pulling are easily injured by wet. It is not so much the water as the mixture of earth with it which rots the pods and discolors the beans.

TO KEEP THE BEANS FROM THE GROUND is therefore the first requisite to success. I know nothing better for this than to take a couple of fence boards or rails, place them side by side with just enough room between them to drive a row of stakes. Let the boards or rails lie north and south; place the pulled beans on the boards, piling them up and twining the vines among the stakes which should be twenty inches or two feet apart. With stakes about four feet high and boards or rails fourteen feet long, from eight to twelve such heaps will clear an acre of heavy beans. When once put up, they will stand a great deal of bad weather without injury. The bean leaves shed the rain like so many shingles, while the long, narrow heaps afford a thorough circulation of air, so that if wet gets in the heap, it dries out before injury is done. This method is recommended wherever beans have to be left out some time, but it is also advisable whenever the weather is unsettled. By this method the beans may be gathered up while green, and their loss by shelling be avoided.

BEAN STRAW is excellent feed for sheep, and should be carefully saved for that purpose. When fed with beans or other grain, it makes a very rich warm manure, quite as good as, if not better than clover. I know a farmer who every winter fattens a considerable number of sheep,



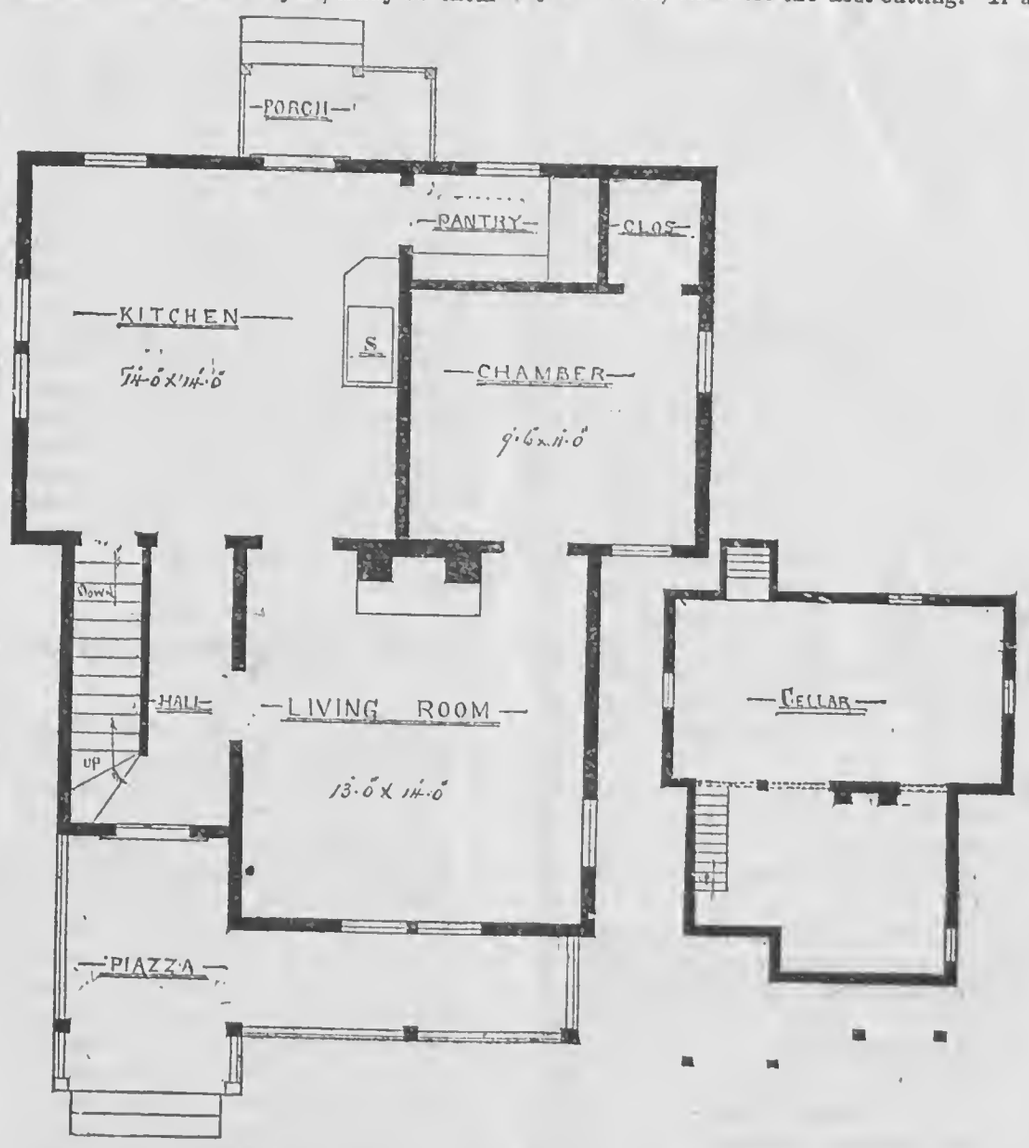
PLAN OF SECOND STORY.—[See 1st page.]

who finds profit in feeding not only his own bean straw, but as much more as he can buy at low rates from farmers who grow beans but, keeping no sheep, have no use for the straw.

Monroe Co., N. Y. W. J. FOWLER.

A CHAMPION OF PRICKLY COMFREY.

Our readers already know our opinion of the merits of Prickly Comfrey, and our reasons therefor, but as our only interest in the question is to discover the truth and to guard our readers against a possible imposition, we deem it only just that they should be placed in possession of both sides of the question, so as to be in a position to form an intelligent opinion upon it. Accordingly we readily place before them the following communication from Mr. Wilcox, whose first letter on the same subject, many of them



PLAN OF FIRST STORY.—[See 1st page.]

will probably remember having seen in the RURAL last spring.

EDITOR RURAL NEW-YORKER:—Some time since, I saw an editorial in your paper, saying nothing would eat the Prickly Comfrey. I wished to answer it at the time, but was ill, and could not. Last spring I gave in the RURAL my experience with this plant, afterwards advertised with you, and sold plants to a number of your readers. To allay any suspicion which they may possibly have, let me give the following testimonial from Chas. V. Mesler, and A. J. Smith, which is affirmed to, before a notary.

"By request of Mr. Wilson, on the 17th day of May, we selected three plants of Comfrey in his field; we cut the tops and weighed them. Again on the first day of July, 1878, we cut the same plants and weighed them. The total amount of the two cuttings of the three plants was 61½ pounds. We believe there were many other plants fully as large. We witnessed stock eating the plants with apparent relish, and Mr. J. Craine, president of the Niagara Farmers Club, was present at the second cutting, and thinks the plant a valuable one for its intended purposes."

At 3 feet apart there are 4820 plants on an acre. There were 20½ lbs. for each plant, for the two cuttings, which would make at the rate of 49 810-2000 tons to the acre, to July 1st. Both cuttings should have been cut one week earlier. Five weeks will mature a growth. As it grows early and late in the season, six cuttings may be made in this latitude. My plants had no fertilizer from the time they were put out, a year before, till after the first cutting. If any reader of the RURAL, who has Comfrey and can get no animal to eat it, and is suspicious that he has an elephant on his hands—just as I felt about a year ago—will follow directions, before winter he will agree with me that, taking everything into consideration, there is no plant known that is one-fourth as valuable as a forage plant. It affords a daily supply of nutritious food that will fatten any animal, while it costs little trouble to grow it. Few animals will voluntarily eat it at first, as it has what is to them a disagreeable odor. Before feeding them to stock, the leaves should be run through a cutting machine, or cut with a knife, wetted and mixed with bran or meal, with a little salt added. The animal to be initiated into their use, should be confined after fasting one night; then after breakfasting on Comfrey, hay should be fed at noon, and at night more Comfrey, and when this has been eaten, more hay, gradually decreasing hay and ground food, and increasing Comfrey. In three or four days the trouble is over, and your stock will grow to like it better daily, I have demonstrated to my satisfaction that it increases the flow of milk in cows, and improves the flavor greatly. Pigs will thrive nicely on Comfrey and plenty of water. I have several thousand plants growing under large apple trees. Those that the sun has never shone on, thrive as well as those exposed to his rays. I think they will do well in a wood where the growth is not too dense. There are readers of the RURAL who have plants enough to make a fair test, will they make it and give the result before winter? G. A. W.

Niagara Co., N. Y.

CHAMPLAIN AND DEFIANCE.

CRITTENDEN CO., Vt., Sept, 18.

EXCESSIVE wet during seed-time, a drought of a severity never before experienced in our Champlain Valley when wheat was filling its heads, and at harvest frequent, almost daily rains, combined to make the past season very trying here for wheat, yet with our growers the Champlain and Defiance hold their reputation for superiority. To sow cereals thinly in detached plots and fertilize the crop liberally is to invite the attacks of rust, midge, &c. When the weather became bad, I expected I should hear reports of many failures with my new varieties; but I still hope their dissemination will do agriculture some good. C. G. PRINGLE.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

IN regard to escutcheons, we are willing to admit that a good cow generally has a large or well developed escutcheon, but that the theory is without exceptions is a mistake. A nicely developed escutcheon is a handsome feature in a cow, and also in a bull, and with stock-breeders it is considered a valuable point, and in the scale of points of the Jersey Cattle Club it is considered important. It is, however, more fanciful than a well developed and well shaped udder, or prominent milk veins. The shape of the body we should consider a more important feature, and we should prefer a cow with a poor escutcheon, and properly formed in the body, to one with ever so much width and outline of escutcheon, and a beefy and unmilk-like form. It may be urged that a cow with a fine escutcheon would not have such an inconsistent form; but, nevertheless, such is frequently the case, and all cows of this style are poor milkers.

A patch of orchard-grass in the door-yard is now being mowed for the third time this season. The blades will average 16 inches in length. Now and then a tussock has sent up a few stalks, which have headed out. The young pigs get a feeding twice a day of this green grass or the stalks of the sweet corn, after the ears have been plucked off for cooking. This green feed keeps the pigs healthy, and helps out where there are more pigs than cows. The old rule, "a pig to a cow," we never could live up to, as we invariably have several pigs to a cow, and so the orchard-grass and all the weeds about the garden help very much to keep the pigs growing.

We never ate better bread than at Nathaniel Mann's, a few days ago. It was made from Clawson wheat. Miss Mann, who made the bread, said, at first the flour was so poor she could not make good bread out of it, but the miller had learned how to grind it, and now there was no difficulty in making nice bread. We suspect it will not bear too close grinding and sifting. In other words, canaille, the coarser part, must be kept out of the flour.

To-day the thermometer, hanging in the shade on the north side of the house, marked 80 degrees. An hour afterwards the same instrument, having been removed to the cellar, indicated 65 degrees, a difference of 15 degrees between the outside and inside of the cellar. This was at 11 o'clock. At 65 deg., the butter comes firm and solid in a half-hour. This was the natural cellar temperature, caused by keeping it closed. We do not open the windows any more nights, as sufficient change of air comes in through one of the outside doors, which is left open all the time. This door does not open out-of-doors but into on outer room where there is a screen door, through which the air can pass at

all times. Where the cellar doors open into the open air they should be kept closed, and the cellar ventilated by the windows at night. If the cellar is kept perfectly clean, but little ventilation is necessary. If any milk is spilled it should be wiped up at once and all vegetables be kept away from the milk or butter. Milk and butter do not breathe but they can smell, and bad odors are very offensive and injurious to them.

A few handfuls of gypsum (plaster), sprinkled around the back door or privy, will absorb all of the bad odors and perhaps keep sickness away. We always save a half barrel of it and have a dishful on hand in the wood-house for use. Five minutes after it is spread around, all offensive and sickening smells will cease. A farmer had better go hungry than leave these things unattended to. Whenever he does do it he is running up an account with the doctor and very likely will soon be in debt to the undertaker, and if he doesn't, a nasty cess-pool is not desirable about one's dwelling.

Next week the fairs begin. We shall put the sheep and cattle designed for exhibition in the stables a few days before and give them hay and a little meal to *dry* the bowels. They will drive better and will not shrink so badly while on exhibition. We do not give cattle green feed at the fairs.

HINTS BY THE ROADSIDE.—No. 2.

WHAT KIND OF MANURES.

My neighbor Harris purchased a few bags of Mapes' commercial fertilizer, last Spring, to eke out his scanty supply of barnyard manure, and I see that he applied it in the hill, by the small quantity, for corn, beans, potatoes, cucumbers, melons, etc., and now in midsummer, he has very small vines, poor corn, and only fair beans, and potatoes. The difficulty is, that however valuable the commercial manures may be, they need to be composted as much as any other green manure. They are too hearty, too hot for the young roots, and the plants are apt to become congested. If my neighbor Harris had purchased his commercial fertilizer six months or a year before he wished to apply it, and had composted it with two or three times its bulk of moist earth, or had mixed it lightly but evenly through his compost heap, he would have had a good result. He will find a good crop upon the ground where this fertilizer was applied, late this fall, or next season, as the bone and superphosphate will then have become decomposed in the soil.

If my neighbor Harris would scrape his yard, and the surroundings of his buildings, and pile up a neat compost heap under cover, and turn it over two or three times during the summer, he would have no need of experiments with the commercial fertilizers. The crop of weeds is too large in quite a number of places.

WORKING ROADS.

I was road-master one year, a few years since, and warned all the district out with picks and crowbars; not a plow or yoke of oxen was allowed. No scrapers, or idle carts, only picks and crowbars. Our district was three miles long, and much of it up hill and down dale, and everybody said it was the worst, stoniest piece of road in the county. I set three gangs of men at work, one to each mile, and we worked eight hours a day, for three days, and I credited each man six days. When we got through, there were stones enough upon the sides of that three mile district of road, to make a stone wall. Now those three miles are the best and the hardest, and smoothest three miles of road in the county.

If my neighboring road-masters would take the hint to dig out the stones, instead of covering them up each year, my wagon tires and axles would last as long again as they now do.

ROAD FRONTS.

While I am giving my neighbors hints about roads, I wish to hint that a neatly improved road-front to a farm, will add ten dollars an acre to the value of any farm in the country. Building a neat bank wall, and grading off the sides of the road, will give each farmer the name of a man of taste, will raise him in his own and his neighbors' estimation wonderfully, besides educating his children, as well as every visitor or passer-by. It should be a matter of pride with each farmer to make his road-front an example of neatness.

TESTING VEGETABLE SEEDS.

SECOND SERIES.

PROFESSOR W. J. BEAL.

THE striking results reached in testing seeds last year, encouraged me to continue the work this spring. I purchased in Lansing and in Battle Creek, seeds of the following vegetables. These were sold on commission at the groceries. They were tested in about the same way as last year, in the greenhouse, in folds of thick paper kept damp, and nearly of an even temperature of about 60 degrees. We have found no other way by which so large a proportion of seeds will germinate. In nearly every case the variety of any vegetable was the same, no matter by what firm it was sent out. For example, all the papers of beets were labeled "Blood beet" all onions "Yellow Danvers," all squashes, "Hubbard."

	Per cent.
Lyman Seed Co.	50
Detroit Seed Co.	59
Briggs & Brothers	70
Shaker Seed Co.	88
Agricultural College	87

In case of the College seeds, those of cabbage, parsnip and salsify came up from a single plant grown in an isolated place. It is believed by many that such plants will not produce so many or so good seeds as those grown on plants where there are several of a kind together. In case of beans and peas, we know the above suspicion is founded on fact. I shall be glad if either of the above firms can find as good an explanation for the poor quality of some of their seeds.

Seeds which average, as many of the above average, cannot be considered good seeds. No firm which will send out such seeds can be considered *reliable* in the sense in which this word should be taken.

Seedsmen generally claim to have recently tested their seeds and to send out none but good seeds. I still think there is great need of reform in this seed business, especially where seeds are sold on commission.

Agricultural College, Lansing, Mich.

EVERY-DAY NOTES.

SAMUEL PARSONS.

BUSHY RHODODENDRONS.

ONE of the strong arguments employed for imported Rhododendrons is that they are more bushy than those propagated in this country. This is undoubtedly the case, with limitations, the whys and wherefores of which I cannot at present fully discuss. The solid, practical fact is that a Rhododendron, when first taken from the box received from England, shows a bushier habit as well as a brighter green than anything of the kind grown in America. At first, this seems a very heavy count to set against the other superior qualities of American-grown Rhododendrons and is so used by interested parties. But let us look closer and follow the after career of this English-grown Rhododendron. What do we actually find? The first summer, the leaves barely retain their beautiful English green. After that, the influences of both summer and winter begin to destroy the lower leaves and dim the green; so that in two or three years a hundred such Rhododendrons might be mixed indiscriminately with an equal number of American-grown, and found utterly undistinguishable. Certain kinds will always remain bushy whether English or American, and others, the contrary, like Album, Elegans, etc. English Rhododendrons can no more resist American suns and changes than English complexions; but toughness and beauty belong to certain kinds alike whether born in America or Europe. It is well to do justice in this matter, for misrepresentation has occurred both unintentionally and otherwise.

A LATE MAGNOLIA.

Magnolia hypoleuca has been mentioned and commended more than once, for many noteworthy qualities. It is late, blooming in mid-June, creamy-white like conspicua, and moreover, of a scent so sweet that for the want of a truer comparison, I will liken it to the combined odor of strawberries and bananas. I know of no Magnolia so delicious, unless it be the tender M. fuscata. Now all this is a great deal for a single species to possess in the way of delightful qualities. But Nature seems disposed to give even more, for the foliage of M. hypoleuca is simply exquisite. I refer more especially to the young leaves, although the older leaves have fine red stems and glossy green on their broad surfaces. But the young leaves with thinner, more delicate texture, show this red in the veinings and even farther throughout the general green to the extent of a faint tint or tone. The result is a suffusion of most delicate purples lined out with red veins. Held up against strong sunlight the effect is greatly enhanced by the translucent character of the leaf. Portions of the foliage in ordinary lights thus assume a curious bronze color, as a result of the mingling of shades, and the distinct white of the under side makes the appearance still more remarkable. I dwell particularly on the foliage of this new and rare Magnolia that I may enter a plea for the beauty of leaves generally. Flowers are so valued and set above mere foliage, that the latter, though in many cases quite as exquisite, receives scant justice.

PTEROSTYRAX HISPIDUM.

In the London Garden for April 20th, 1878, a fine illustration is given of this extremely rare and noteworthy shrub. Under another name, Styrax obassia, we received many plants direct from Japan, through Mr. Thomas Hogg. The appearance of its clusters of white flowers, as shown in the Garden, is very pleasing, and it certainy bids fair to prove valuable. Whether it will turn out hardy remains to be tested rather more thoroughly before it is proved an established fact. Two winters' trial in Flushing has failed to injure it, but I have an idea that, like Halesia diptera, also a native of the East, it will be killed down occasionally. With its flowers and large, light-colored, roundish leaves, it is very attractive nevertheless, and if we discarded all shrubs that occasionally suffered from the winter, our list of enjoyable plants would be much diminished. All suspicions of its hardiness may, moreover, be quite unfounded. Special note of the fact should be taken that Styrax obassia (Pterostyrax hispidum) and Styrax Japonica are two entirely distinct plants. Of the latter, I may hope to speak at a future day.

Flushing, L. I.

BEAUTY, AND USEFULNESS OF AUTUMN LEAVES.

I WAS out a few evenings ago for a drive, and I saw a lady retrace her steps to gather a few Autumn leaves;—evidently, she enjoyed their beauty! A little farther on, I saw a lady sweeping the ripe leaves out of her yard into the street, to be lost. I said to myself, "She cares neither for the *beauty* nor for the *utility* of Autumn leaves." Why is it that people keep up such destruction from the falling of the first ripe leaf until the trees are bare? We cannot afford such a loss; for loss it is. Leaves should be carefully gathered, even those from the street, if they fall from the trees belonging to us, in front of our homes. There is nothing nicer for covering tender plants that are to be left in the ground, or to protect the lawn in winter. "Leaves are Nature's covering," and they are far more sightly than much of the material used in their place to protect the garden from frost. All that are not needed to cover plants, can be piled in an out-of-the-way corner, and covered with sods, to keep them in place. Suds should be turned over the pile on washing-day, and the mass should, occasionally, be stirred from the bottom. Leaves treated in this way, will decay gradually, forming a rich mold that any florist will prize.

Pressed Autumn leaves, tastefully arranged with dried ferns, are fine for decorating the house; but in our admiration for the *beautiful*, let us not forget the *useful*.

EVERGREENS.

E. R. C.

WE WANT MORE EVERGREENS.

IN looking over the "places" of my friends and neighbors it seemed to me that the useful and ornamental qualities of these trees are not half appreciated. A belt of Pines and Firs in the right place, forms a sort of land break-water that effectually screens house and grounds from cold winds and driving storms, protecting tender plants and trees, and making their growth possible in bleak, unkindly regions where they could not possibly flourish without this sturdy shield.

Evergreens are objects of beauty at all seasons. In the spring they give a southern and verdant character to the landscape on the first sunny day, when not even the earliest Poplar or Willow has burst its bonds. As summer dies, they form the richest background to the kaleidoscopic coloring of the changing autumn leaves; and in winter, they rob the chilly frost-king of his sternest terrors.

Many fine Evergreens are indigenous to our own country, and certainly within the reach of all who have to do with the planting of trees. The most desirable of these are the Hemlock, the White Pine, the Norway Spruce, and the Balsam Fir.

THE HEMLOCK

is particularly graceful and delicate; and although its natural haunts are the sides of steep mountains or wild northern forests, where it is found in gloomy masses, imparting a particularly somber aspect to the scenery. A single tree on a well-kept lawn is an object of striking beauty, its branches spreading out and sweeping the ground with the grace of a trailing robe, while the delicate, feathery foliage seems to float freely in the air, and the well-proportioned outline is like a strain of harmony. It is a favorite of mine, this picturesque Hemlock; and its airy gracefulness is a pleasant exception to the almost inevitable stiffness of Evergreens. With its Christmas frosting of snow, it is the perfection of beauty; and the March rains love it, too, and deck its tresses with jewels.

The Hemlock is said to be a difficult tree to transplant satisfactorily, and is charged with general delicacy of constitution; but all evergreen trees have more tender roots than deciduous ones, as they cannot bear the same exposure to sun and air; and, once dried and shriveled, the plant is pretty sure to die. The Hemlock is like a good many other things, not difficult to manage if managed rightly; and a frozen ball of earth at the roots in winter, or a damp ball in the spring, is all that is necessary.

The magnificent

CEDAR OF LEBANON

is the patriarch among trees, as it requires age to perfect its beauty and is, even at forty years, but an infant. Its trunk will sometimes reach a circumference of from thirty to forty feet; and though exceeded in hight by some Oregon Pines, in breadth and massiveness it is the greatest of all Evergreens, and in a perfect state is not equaled by any sylvan tree of temperate regions. A peculiarity of the Cedar of Lebanon is the horizontal disposition of its wide-spreading branches. This is not apparent in very young trees, but shows itself as soon as they begin to develop large heads. One such tree in the middle of an extensive lawn, with all other trees at a respectful distance, is a perfect monarch of verdure. Grand, magnificent, stately, are its proper epithets; and it requires room to develop properly and be appreciated. An "elbowed" Cedar of Lebanon is like a church in a row of houses. It condescends, however, to overlook the matter of soil, and will do equally well in poor gravel or rich loam; but near the margin of a pond or spring, where its roots can reach the water, it makes rapid progress. Under ordinary circumstances, it will advance, in this country, about a foot a year; but if deeply trenched before planting, and if the roots have abundant moisture, this average will be doubled.

THE NORWAY SPRUCE,

although of foreign origin, has become so naturalized that it is perfectly hardy; and it forms a valuable protection to tender young trees in exposed situations. It is accommodating enough to grow anywhere and in any soil; and is decidedly picturesque when advanced in years, towering up from a base of thick branches which droop and fall to the very lawn, and hang off in those depending curves which make it such a favorite with artists. Another of its good qualities is that it grows rapidly, and hence is particularly available for hedges. It will bear clipping to any extent, and can be made to form an almost impenetrable wall of foliage, proving quite invaluable in the cold north-eastern regions of our country, where some barrier against the wind and weather seems necessary at all seasons.

THE CHINESE MAGNOLIA,

which is hardy in our climate, flowers without leaves. During the month of April and the early part of May, its white and purple blossoms are the most conspicuous floral objects to be seen. The numerous branches are thickly studded with large, tulip-shaped flowers that have thick, kid-like petals and breathe forth a rich, spicy odor. The white variety is charming; and the creamy flowers are produced in such abundance that a good-sized tree can be seen at a great distance. The Chinese name, Yulan—literally lily-tree—is an apt and expressive one, as the blossoms are not much unlike those of the White Lily in size and shape, when fully expanded. Among the Chinese poets, they are considered emblems of candor and beauty.

Among Pines,

THE WHITE PINE

is the most desirable. The soft and agreeable hue of its pliant foliage, the excellent form of the tree, and its adaptation to a great variety of soils and sites, are all recommendations. It is always the same bright green, too, whatever the temperature may be; and it bears transplanting admirably. Other Evergreens, with the exception perhaps, of the Hemlock, are dullest just when their brightness is most needed; and the thin summer growth of the White Pine is as delicate and freshly pretty as the Juno dress of any deciduous tree in the full tide of its boasted beauty.

The most beautiful of Evergreens is the

MAGNOLIA GRANDIFLORA

of the Southern States. It grows to the hight of seventy or eighty feet; and its thick, deep-green, glossy leaves are like those of a gigantic Laurel. The great, creamy blossom tinged with the palest olive on the outer petals, is a bouquet of itself; and a tree-ful of these censers will waft perfume through the whole woods about them. This gem among Evergreens will not bear the winters north of New York, nor there either, I should imagine; but it can be made quite hardy in the milder Middle States.

THE BALSAM FIR,

also known as Balm of Gilead Fir, is particularly neat in its growth, and of a dark-green hue. It is sometimes thirty or forty feet high, but is more ornamental when much lower. It is a rather formal-looking Evergreen; and gets decidedly stiff and ugly with age. It is quite popular, though, as it retains its color well and is easily transplanted and is considerably in demand for shrubberies, small gardens and courtyards.

THE CHILI PINE

is very peculiar, having five circles or tiers of branches growing at equal distances, and producing the effect of a magnificent pyramid. The stem, branches, and shoots are entirely covered with leaves of a fine deep green; those leaves are very regularly and symmetrically disposed, and being bent backward at the ends, give to the tree the form and effect of an antique girandole.

THE CALIFORNIA SILVER FIR

is two hundred feet high, and has beautiful silvery foliage. The grand Pines of that region are the largest and loftiest in the world.

Among

EVERGREEN SHRUBS,

the Holly and the Arbor-vitæ are particularly ornamental; while as a vine, the lovely clinging, English Ivy never wearies of its kind office of draping ugliness and decay with perennial beauty.

RETINOSPORA FILIFERA.

RETINOSPORA FILIFERA.

There are many Retinosporas. One firm exhibited twenty-three distinct varieties at the summer exhibition of the N. Y. Horticultural Society, and endless forms might be distinguished among curious variations of well-known kinds. Whether they would be worth such perpetuation is another question. Nearly all varieties now known have existed in Japan for unknown periods, although introduced so recently to America. They all seem to be remarkably hardy, perhaps more so than any other species of evergreen. But their distinguishing characteristic is extreme diversity of color and form. Erect, weeping, thread-like and almost broad-leaved, they seem to delight in showing what diverse forms Nature can succeed in producing in one species. The Retinosporas resemble somewhat the Arbor-Vitæ of America, and evince affinities with that species in the way of grafting on them as stocks, &c, R. pisifera and obtusa are the two most distinct varieties, and the variations come more especially from them. The subject of our illustration, R. filifera, seems to be related to pisifera rather than to obtusa. It is a remarkable form, and has been known at least a dozen years in Europe. In Japan it appears to be a common tree, as Gordon remarks that it is much planted in the gardens about Yeddo on account of its elegant appearance.

The same author says, referring to R. filifera, "This kind forms a beautiful tree, fifty feet high, pyramidal in outline, and peculiarly graceful on account of its drooping branches and long, pendulous spray."

As we know R. filifera in America, it is quite dwarf in habit, which, of course may be the case with trees that attain in time very considerable size. The name, filifera, thread-bearing, well describes its appearance, which is that of a dishevcled head of coarse hair. How it looks in mature age is quite unknown to us, but the name, filifera, will doubtless continue to describe it quite accurately. In general employment in groups or singly it behaves very much like other Retinosporas. The curious and dwarf form it assumes, also fits it for planting in small interesting groups near the house, where all obstructions to the view are to be avoided. For the same reason, it finds suitable employment in small grounds, where, as one of a group of evergreens of similar character, it retains a low form which should be sought more by those who plant such places.

The specimen illustrated is about 18 or 20 inches high and some eight years old. It has, however, been transplanted several times, which partly accounts for its dwarfness. It was sketched by our artist in the grounds of S. B. Parsons, of Flushing, L. I.

Floricultural.

FLOWERS FOR THE HOUSE.

M. G. R.

There are many common garden flowers that are desirable for house culture, but we are apt to overlook them in our desire for something *rare*. Garden plants may be lifted at any time before frost, but the best time is previous to the middle of September. They should be kept in the shade a few days, and watered moderately. At this season we can find small seedlings that will not mature, if left out of doors, but if removed to the house, will give abundant bloom, during winter. Among these are Petunias, Verbenas, Pansies, Sweet Alyssum, etc. Perhaps none of these grows with less care than the Petunia.

Two or more varieties growing in the same pot, and trained on a small wire trellis, have a pretty effect. Verbenas need light and warmth and an occasional washing, to keep them from the attacks of insects. Pansies must have a cool atmosphere and moisture, but should not be kept too moist, lest the stalk "damp off." The fragrant little Sweet Alyssum makes a neat edging for tree-shaped plants, like the Orange, or Oleander. Set the small seedlings around the edge of the pot, or sow the seeds. If old Geraniums are to be kept for the house, it is best to cut them down to within a few inches of the pot. Fuchsias need about the same treatment, but good, strong plants of either may be had by setting slips in summer.

Mignonette is difficult to transplant, but we can have it all winter by sowing the seeds in small pots, at intervals of a week. Late-blooming Asters may be potted for the house, for early winter-blooming; they are very easily transplanted. The Dicentra spectabilis, known as Bleeding Heart, is a fine plant for the house. A good clump of it, taken up in autumn, will bloom beautifully in winter and early spring. Its graceful racemes of delicate, yet showy flowers, make it a most attractive window plant. As a center plant, for a large collection, there is nothing better. When it stops blooming, and the foliage becomes yellow, put it in the cellar, and keep it there until the frost is out of the ground, when it may again be set in the open border.

SOIL FOR HOUSE PLANTS.

The soil for house plants should be prepared a day or two before wanted, and left lying on the ground, where a few chickens can have access to it. They will soon free it from the earth-worms that might otherwise be troublesome in winter.

To prepare the soil: Take one peck of good earth from the garden; if not sandy enough, add sand or road-dust; next, add a half peck each of black leaf mold and fine chip dirt. Mix thoroughly, and sift if lumpy. After the chickens have worked in it to their "hearts' content," add again a quart of soot or finely powdered charcoal; mix again, and it is ready for use. A keg of this soil will be found very useful, if stored in the cellar, as we sometimes wish to sow seed, or re-pot a plant in winter, when the ground is frozen. Some florists scald, or bake the earth for pot plants, but I find the *chicken process* the easiest and most effectual for destroying earth-worms. It is true that fowls scatter the soil in all directions, but it can be gathered.

VINES FOR THE HOUSE.

The English Ivy is beautiful wherever we see it; but for decorating the house, it seems a little superior to any other vine. When trained over doors, windows and pictures, the rich, dark leaves show to advantage, especially if the walls and wood-work of the rooms are white. If Madeira Vines are trained near Ivies, so that the leaves mingle: the contrast is very pleasing. The Maurandia Vine, is a very pretty climber; it is a neat plant, with good-sized flowers; there are several colors, but I always found the white variety most satisfactory. The White Jasmine blooms well in winter, and the small flowers are fragrant. For hanging vases, the Tradescantia, or Wandering Jew, is a general favorite. It grows freely in earth or water, and though it does not bear the sun, it needs light. If grown in pots, it must be kept wet. The three varieties that I know, all grow equally well. The striped varieties are quite pretty, but the plain green is very rich in color if kept partially shaded. Ice Plant and Kenilworth Ivy are both useful for brackets. The Smilax is a delicate vine of great beauty, and, by proper training, it can be made to *climb* or *droop*. The old-fashioned Myrtle should not be overlooked. The glossy leaves make it useful for trimming purposes. A root of Myrtle, transplanted from the garden to the house in autumn, will thrive with very little care.

Pomology

PEACHES IN NEBRASKA.

Probably one of the finest peach orchards in the West is at Brownville, Neb., under the control of ex-Governor R. W. Furnas. The orchard was planted nine years ago, on freshly-broken land. Part is budded and part seedling fruit.

In a small part of the orchard apple and peach trees were planted alternately. The former now look starved and crowded, while the latter are uniformly healthy and enormous bearers. The overburdened limbs seem ready to break with the luscious fruit. We are told the peach crop rarely fails in this locality. The yield from this orchard, this year, will be over 10,000 bushels. Budded fruit is picked in baskets, each holding about a peck and a quarter, and they brought one dollar at wholesale Sept. 1. For shipment, each peach is carefully wrapped in paper. Mr. Furnas considers Early Newington one of his most profitable sorts. Blood Cling seemed quite a favorite, not to mention the old standard varieties. Seedling peaches are very plentiful, and bring from 35 to 70c. per bushel. Mr. F. has raised a number of very promising seedlings. Part of the peach crop is dried by a new system

Plums are raised here to some extent and with good success. Cotton is bound around the trunks of the trees to prevent the ravages of the curculio. Mr. F. says this is very effective.

Xineohp.

The Apiarian.

A COUPLE OF SUCCESSFUL BEE-KEEPERS.

For the encouragement of beginners in bee-keeping, I wish to relate the success of two gentlemen of Carson City, Montcalm Co., Mich., who began keeping bees, for the first time, this season. One of them, Mr. O. R. Goodno, started in the spring with thirteen hives. From this stock, although this year has not been very favorable for bee-keepers, he has during the summer sold 1000 pounds of honey, one-half of which was sold in the comb, the rest extracted, and, moreover, he has increased his stock to thirty-three colonies. The increase of colonies alone, gives him a margin of, at least, 150 per cent on the investment, besides the 1000 pounds of honey.

The other gentleman, Mr. C. Cross, invested last spring $500 in 47 colonies. He has not only sold honey enough to regain the investment, but has increased his apiary to 81 strong colonies, which altogether shows a margin of about 300 per cent on the investment. I doubt if the most sagacious speculators of Wall St., can show returns that equal these. I must add that these gentlemen have not reached such results by a mere hit of "good luck" Both studied the subject carefully, and applied that intelligent management which is the basis of success in everything. C. C. Georgeson.

State Agricultural College, Lansing.

The Querist.

ANSWERS TO CORRESPONDENTS.

Wheat Bran as a Fertilizer.

A Subscriber, Marietta, Ga., asks for information in regard to wheat bran as a fertilizer for corn or cotton. Price of corn, 60c; cotton, 10c.; bran, $15 per ton; cash price of commercial fertilizers, $40 to $50.

ANS.—Wheat bran has been used as a fertilizer in the Connecticut Valley for tobacco with much success. It has been used by market gardeners in growing sweet corn and melons also very successfully. There is no doubt that it would answer equally well for corn or cotton. Rye bran is richer in fertilizing matters than wheat bran, and the following table gives the comparative values of both wheat and rye bran, barn-yard manure, Peruvian guano and ordinary raw-bone superphosphate, both intrinsically as fertilizers, and also commercially in money.

In 2,000 lbs. there are contained in

	Nitrogen.	Potash.	Phosphoric Acid.	Money value.
Wheat bran..... .....per ℔	41.8	28.6	54.6	$18.10
Rye bran..... ..... " "	46.4	38.6	68.6	20.60
Barn-yard Manure..... " "	9.0	10.4	4.2	3.05
Peruvian Guano. ..... " "	200 0	46.0	260.0	78.70
Raw bone Superphosphate..... ..... " "	40.0	2.0	320.0	42.12

The values are made up at the estimate of 25 cents a pound for nitrogen; 6 cents for potash; and 10 cents for phosphoric acid. In practical use the materials in the bran would be more available than in any others, because they are in an organic form, readily decomposed, and more easily dissolved and assimilated by plants.

It follows, then, that wheat bran (and more especially rye bran), is cheaper as a fertilizer at $15 per ton than Peruvian guano at $70, or superphosphate of lime at $40 per ton.

It might be proper to state that bran contains, in addition to those matters given above, much oil and fat, which would be usefully applied in feeding animals. Nearly the whole of the fertilizing properties would remain in the droppings, liquid and solid, of the animals fed; and, moreover, they would be in more available condition in the dung than in the raw bran, so that it would be a great economy to feed the bran, and save and use the manure made from it. Used in this way, bran possesses a much higher value as a fertilizer than any of the mineral manures, and the manure made from it may reasonably be considered as equal in value to the bran itself, notwithstanding a portion of it has been utilized as nutriment for feeding animals. To feed bran, then, and make manure from it, is the most useful and economical method of utilizing it as a fertilizer.

Tingis Arcuata.

Alexander Moore, Chickasaw Co., Miss., sends some specimens of a minute insect, and asks the name, history, and how best to get rid of it. Its kindred attack the hedge plant, Pyracanth, and often destroy it when young.

ANSWERED BY J. STAUFFER.

ANS.—This is a very singular and remarkable creature, and can hardly be described as seen under the microscope. It belongs to Westwood's Family 6 (or 8) Tingidæ, which embraces nine genera, and many species. The old genus Tingis is now divided into the following four genera:—

1. Monanthia, sides of prothorax scarcely dilated; antennæ piloso, last joint clavate.

2. Galeatus, prothorax much dilated at the sides, with a large hood in front; antennæ long, slender, pilose; areolæ of the thorax and hemelytra very large.

3 Dictyonota, sides of thorax dilated, and areolate; the antennæ scabrous; terminal joint thinner than the third; prothorax with a frontal hood.

4. Acalypta Prothorax, with the sides slightly dilated, 3-carinated; antennæ long, clavate, hemelytra meeting in a straight suture; wings wanting.

These generally have the thorax furnished with a membranous dilation on each side, and posteriorly produced in the place of a scutellum, and being, as well as the large hemelytra, (which lie over and cover the abdomen) formed with greater or less sized cell-like reticulations. Their habit is much the same. The Tingis Pyri attacks the leaves of the Pear, and is known by the French gardeners under the name of "*le tigre.*" It belongs to the "Bug-Tribe," order Heteroptera, or Hemiptera Heteroptera. In Say's Entomology, vol. 1, page 348-9, he describes five species—gives the specific character for Tingis ciliata; this specimen accords, in many respects with this common species as described by Say. The T. arcuata, is very much like the ciliata, distinguished mainly by the brown bands and the arcuated exterior edge of the hemelytra. Fitch's Noxious Insects, Reports 3, 4 and 5, p. 148, give a full description of the Butternut tingis, (Tingis Inglandis, new species,) which punctures the leaves and sucks the juices. Found also on various other trees and shrubs. He adds, that this corresponds with Say's T. arcuata, except that the outer margin of the wing covers is rectilinear and not arcuated or concavely excavated, as the specimen is which was sent by Mr. Moore, and shows the brown bands also. Therefore we may call this Tingis arcuata, for the present. Charles H. Peck, Albany, N. Y., found a similar leaf-bug on the Basswood, named by Mr. Walsh as Tingis (monanthia) tiliæ. The T. ciliata of Say is found on the Sycamore, and is called Sycamore-leaf bug.

The effects of all are much the same—causing the small, dead, dark-brown spots by the punctures made in sucking the juices. We can find no remedy—Harris is silent, and others fail to give a remedy. Fumigation is mentioned by one writer incidentally.

"Big Worms," Caterpillers.

Mr. Geo. Washington Lee, of Columbiana Co., Ohio, sends us per mail, two "worms" that he found on one of his young apple trees; he states that they are new in that region, he noticed that there was something wrong with the tree, but before the culprit was detected, it was found that they worked very fast, eating leaf, and stem close to the bud, or hard wood; he desires to have our opinion.

ANS. The "worms" are really very large and thick caterpillars, 2½ inches long, and one inch in circumference, that have minute warts on each ring, with a single fine hair; the prolegs are hairy, or beset with very short bristles, the spiracles yellowish, as also a lateral line on each ring, sloping across the spiracles, or breathing pores.

It has much the general aspect of the larva of the Cecropia moths, the largest of our butterfly moth tribe of Lepidoptera. But it does not accord with any known to us, in the details. We submitted one of these larvæ to an experienced entomologist, who at first sight pronounced it the larva of the Cecropia Luna, which he had raised on several occasions, as well as numerous other species from their larval state. Yet, after carefully comparing it with accurate figures and descriptions of his own, and examining the researches of Fitch, Harris, and others, carefully, he could not determine the imago or perfect moth resulting from said caterpillar.

We would advise Mr. Lee to follow them up to their transformation, by finding the cocoon, and keeping it until it develops into a moth. A good plan is to have a box with the lower portion filled with common garden soil, say six inches deep, the upper portion covered with netting, and a lid so as to feed the catterpillar, if not fully matured, until he spins up into a cocoon, or enters the soil to undergo the change. In this way one can prove what insect will be developed from a certain caterpillar. A box set on end, 12 inches high, and six inches square, will answer the purpose very well, and may prove of interest to any desirous to study insect life.

It may be that these larvæ, or these worms, are a new phase in a feeder on other trees, or a new importation of a species not yet known to science, but changes occur in the same genera both as regards their food and consequent color and development.

Choice Grapes.

W. H. E., East Setauket, Suffolk Co., L. I., asks—1. Which are the most hardy and profitable, first-quality, market grapes. He has been thinking of the Salem; Rogers No. 53; Wilder No. 4; Goethe No. 1; Agawam No. 15; Delaware and Maxatawney and wishes to know which, if any, of them would answer best: 2, the name of an approved work on wine-making and where it can be purchased.

ANS.—1. There is no grape that does equally well everywhere. The best plan for a man who intends to set out grape vines, is to go among those who have vines in his own neighborhood and find out which kinds succeed best either near his own home or not far off, under the same climatic conditions. Quality and hardiness do not always go hand-in-hand. Of the above list, Delaware and Maxatawney will doubtless do well and probably Salem, Wilder and Agawam. Concord succeeds well generally, while Worden is as good, or better, and ten days earlier. Whitehall, Northern Muscadine, Merrimack, Martha, Israella, Eumelan, Creveling and Adirondack would probably also succeed in the above locality. As to quality, Delaware, Salem, Wilder, Agawam, Whitehall, Merrimack, Eumelan and Adirondack are of the best quality. Champion, Worden and Eumelan are the earliest.

2. Husmann's Grapes and Wine. $1. The Orange Judd Co., 245 Broadway, N. Y. City.

Miscellaneous.

E. D. B., Seneca Falls, N. Y., asks whether salt would be any preventive against the Hessian-fly, and if it is so considered what is the best time and way to apply it.

ANS.—Salt is no preventive against the Hessian-fly. There are two broods of this pest, one in the fall and one in the spring. Although many advocate sowing early to avoid the ravages of this pest, still, on the whole, the best method of avoiding its depredations, is to sow the wheat late, both in the fall and in the spring. The Fly begins to deposit her eggs, in both cases, at about the same time that the wheat appears above ground, and continues to lay eggs from two to three weeks. By sowing 10 to 14 days later than ordinary seed time, the period of egg-laying will be nearly over before the wheat comes up and the pest thus, to a great extent, avoided. It is also recommended to burn the stubble in the fall.

W. Norfolk, Va. asks for the name of a manufacturer of stencil plates for marking clothing.

ANS.—Stafford Mfg., Co., 66 Fulton St. N. Y.

M. L Dorman, Chautauqua Co., N. Y., ask if raising poultry and eggs for market can be made profitable when eggs are worth only from 10@12½ cts. per dozen and chickens six cents per pound live weight, and corn and other grain sell at prices about as heretofore?

ANS.—The margin of profit under such circumstances must be so narrow as to be perceptible only to those who have been fortunate enough to realize it.

RURAL SPECIAL REPORTS.

COLUMBIA CO., Pa., Sept. 18, 1878.

WE have had a peculiar sort of a season thus far. The spring was summer-like; then, in May, came a week of cold weather. June and July and August were very hot and dry. In some parts of the county plenty of rain fell all the season, but along the Susquehanna River no rain of any account fell for eight weeks until the 13th, when we had a day's down-pour which has set the farmers to plowing again. The hay crop was the best in several years. Wheat and rye were very good in most parts of the county; but in some parts the Fly injured the crops very much. Oats thrash well in the bushel, but light in weight. Corn will not be more than two-thirds of a crop on account of the drought. Buckwheat, where they had rain, will be good, but where there was no rain it is not one-third of a crop. The honey crop is about the same as buckwheat runs—and but very few swarms.

H. H. BROWN.

ANDERSON CO., S. C.

LAST year I planted half an acre for corn fodder; one half in common corn and the other half in "pop corn." The latter yielded, I think, twice as much as the former. Every stalk had from one to five "shoots" and nearly all the stalks had from one to two fair-sized ears, while not more than one-fourth of the common corn had a "nubbin." When cured my cows would eat the pop-corn in preference to the common corn, and were in better condition while fed on it. If any RURAL reader has ever tried pop-corn, I should like to hear of his experience with it.

G. A. MCGEE.

DEER LODGE, Montana, Sept. 3, 1878.

HERE in Montana the season is so short that corn does not mature, so we raise only enough for table use during summer when it is tender. As for fruit, we can raise only the small fruits. In our valley which is much lower than usual, a few apples have been ripened. We hope at no distant period to be able to raise successfully the hardier kinds of fruit. We have to continue to experiment until we find what is suited to this climate.

M. A. L.

BROWN CO., WIS., Sept. 14, 1878.

FROM being very warm the weather at once dropped with the beginning of this week. On Tuesday night there was a severe frost in the low-lands back from the river, in some places forming ice, but on high ground and near the water nothing was hurt. Farmers are doing their fall plowing and sowing rye of which grain a large area promises to be sown, the failure of wheat this year causing farmers to turn their attention to raising a greater variety of grain.

VAN.

CHAUTAUQUA CO., N. Y. Sept. 17, 1878.

THE heavy rain of last week did much damage in some parts of this county by sweeping away a large number of highway bridges, &c. Corn-cutting and potato-digging are now in full blast. Corn is a pretty good crop, while potatoes are small and but few in the hill. Green apples are worth 40 cents per bushel; tomatoes, 3c. per lb; sweet potatoes, 3c. per lb.; grapes, 4@5c. per lb.; oats, 40c. per bushel; corn, 60c. per bushel; table butter, 20c. per lb.; eggs, 10c. per dozen. Trade dollars, 90 cents each.

M. L. D.

RURAL GROUNDS, Bergen Co., Sept. 21, 1878.

FOR a few days past the weather has been as warm as during the hottest of the summer. Pearl Millet is now in bloom and we hope that frost may be delayed long enough to enable it to form seed. The plants have grown to an immense size and we hope to send you a sketch in a few days.

The Poultry Yard.

POULTRY RECORD.

THE RURAL's correspondent "Anon," page 584, Sept. 14th, gives the record of his White Leghorn hens for six months—March 1st to Sept. 1st. I regret that he did not give the number of eggs for each month. A correspondent of the Poultry Yard, some time since, gave a table showing the number of eggs an ordinary hen would lay during each month of the year, viz.: Jan., 4; Feb., 9; Mar., 20; Apl., 17; May, 15; June, 12; July, 9; Aug., 7; Sept., 6; Oct., 3; Nov., 5; Dec. 3. According to this table, "Anon's" 44 Leghorns would have given him 3,520 eggs; the actual number, as reported, being 3,702, or about five per cent. in excess. I give the result from my Plymouth Rocks for three months:—

June,	19 hens,	251 eggs,	averaging	13-4.19
July,	20 "	230 "	"	11½
Aug.,	19 "	221 "	"	11-12.19

This shows an excess of about thirty per cent., or about twenty-five per cent. better than the Leghorns.

The fowls are all last year's chicks; are confined in a large run, with plenty of shade and grass. Their feed consisted of whole corn, cracked corn, oats and ground feed; with scraps from the house, and broken clam-shells. My experience does not accord with that of "Anon," in regard to the value of the Leghorn. After a trial of two years, I discarded them, as being the poorest of any breed among the many tried. Unless the Plymouth Rocks have faults not yet discovered, I place them at the head of the list, as I find many others have done—having the quality of being good layers, sitters and mothers; and, last, but not least, good table fowls—the latter quality will not be claimed, I think, for the Leghorn. For two years previous to the Leghorns, I had the Dominiques, and I regard them next to the Plymouth Rocks—lacking only one point—weight.

G. D. B.

NAPLES, N. Y.

FOR the benefit of RURAL readers who keep breeds of fowls much inclined to sit, I give my way of breaking, in a very short time, a hen obstinately determined to sit. I simply tie her legs together and put her on the floor of the hen-house. Twenty-four, or at most thirty-six hours, in this uncomfortable position, will invariably cure the most obstinate case.

F. G.

TO RID A HEN-HOUSE OF VERMIN.—Clean out all loose rubbish; sweep out all dust and filth; then rub the whole length of the roosts, and the door through which the fowls come in, with gas tar, and lice will trouble your poultry no more.

J. E. S.

The Herdsman.

POLLED CATTLE, &c.

FOR several years I have always said a good word for hornless cattle, contending that horns are not only useless appendages but dangerous and really a nuisance and the cause of many accidents, including abortion, etc.

Now I see that at the Paris Exposition the polled Aberdeen breed carried off the principal premiums from all others, consequently there can be nothing henceforth advanced in favor of these offensive weapons. According to the London Agricultural Gazette, Mr. Mechi prefers hornless animals, and the Irish drovers actually remove the horns, because it answers their purpose to do so. I have been on this continent twenty-two years and first advocated cutting grass when it was in bloom instead of making hay from it when it had seeded. This was nearly twenty years ago, and among others a Mr. Rice of New Jersey attacked me with bitterness and intimated that I knew nothing about hay or hay-making. Next I argued against plowing fine natural-grass land and stuck to it for years. Then I combatted the opinions of a great many to the effect that half the grass grown ought to be left to rot on the ground, contending that by grazing with a variety of stock of which sheep should be a proportion, it was best to keep it evenly grazed and once in the year barely eaten, which would bring in all the best natural grasses and discourage the coarse and worst herbage. Then I tried all possible means of showing how foolish the hollow-horn and tail-evil ideas were and how ridiculous was the notion often entertained of the influence of the moon on so many subjects, but in this I have been only partially successful.

Before their merits are generally recognized, polled cattle must patiently wait till a few more men are gored to death, a great many more cows hooked and inwardly bruised so as to kill the expected offspring and cause miscarriages, besides cruelly injuring the udders of good milch cows, by which bloody milk and inflammation are brought on, so that the teats are lost, one after the other. Then it will begin to be said what silly men there are in the world to go

on breeding horned cattle, plowing up good grass, making hay from dried, ripe herbage, losing half the grass by allowing it to rot on the ground, boring horns with gimlets, cutting tails for imaginary ailment, and throwing seed about in bunches and leaving half the ground bare instead of using a drill. AN OLD HAND.

Industrial Societies.

NEW JERSEY STATE FAIR.

WE know not of any grounds whose situation is better adapted for a fair than that of the fair grounds at Waverly. It is a central point, within easy distance of New York and other large cities, and yet as purely rural as if it were a hundred miles away. The grounds are hilly in one part and level in another, a diversity which is pleasing to the visitor, while it gives prominence to all departments of the exhibition—to those on the hills as seen from the plain, and to those of the plain as seen from the hills.

And yet there is a sad lack of enterprise on the part of the directors of this fair. Year after year we see the self-same arrangement, as if the same articles were carefully preserved in the same places to be exhibited forevermore. Even a change of place for the several classes of articles—a rearrangement of the vegetables, fruits and flowers of the Horticultural tent—would reawaken some interest in the crowds of people who walk about as if they were in a park or cemetery. We saw very few examining the articles displayed. A glance at everything sufficed to satisfy the curiosity, while nothing in particular seemed to offer lessons which were deemed worthy of being studied, if, indeed, we except horse-racing, which certainly did enlist a fair share of attention. It was the *life* of this fair. It is not our purpose to condemn or approve this feature of so-called agricultural and horticultural exhibitions—but this we may say, that when, as at Waverly, it is made to engross more attention from the beginning until the end of the fair than all the other departments put together, we think another qualifying name instead of "Agricultural" should be adopted to express the aims and scope of such exhibitions.

After looking through the agricultural implements and observing that there was nothing new and fewer entries than usual, we passed to the horticultural tent. Here, among grapes, Mr. Ricketts made his usual fine display. Concord No. 1 is a hybrid between Black Muscat of Alexandria and Concord. It is larger and sweeter than Concord. Golden Gem is a cross between Clinton and Delaware, small, of a golden yellow, and very sweet. No. 250—the parentage is Ives and Catawba. Compact bunch, medium to large—large berry, flesh soft, juicy, sweet and vinous; black, with a dark-gray bloom; carries splendidly. Vine hardy and vigorous. Fine bunches of the Lady Washington, which, Mr. Ricketts now offers for sale, were exhibited. In all there were fifty-two varieties.

Among Mr. H. Goldsmith's grapes was a section of a Concord vine, two feet long, eighteen inches wide, bearing fourteen good-sized bunches.

Among pears, Sheldon, Seckel, Beurre Bosc and Beurre Clairgeau were the best.

Very large and perfect specimens of the Maiden's Blush apple, to which we alluded last week, were on exhibition. Orange Pippin, Baldwin, Porter, Gravenstein, Gloria Mundi, were the best of the apples. There were less than one dozen quinces shown, and those might better have been made into jelly.

The potato exhibit was, as usual, very good. Among other vegetables there was really nothing which seemed to us worthy of special mention.

The floricultural display was quite inferior to that of other years, there being fewer plants and no attempt at a tasteful arrangement.

We were told that the Cattle show was excellent—a statement we preferred to accept as a fact without personal verification, at the expense of longer enduring the stifling clouds of dust, all the while drifting from the dusty race-track and enveloping the listless, yawning crowd.

Miscellaneous

GRANGE AGENCY—IS IT EXCEPTIONAL?

ANSWER TO PERLE PERDU.

THE Mississippi correspondent, in RURAL of June 1st, starts out with the idea of "blowing up" the Patrons of Husbandry or rather the Grange Agency at Memphis, and goes on to show the fictitious nature of the advantages offered by said agency, how it carried on business etc. In doing this, the writer relates how a farmer friend purchased his goods of some middleman not particularly favorable to farmers as such, at a few cents better rates than he could have done from the agency with its ramshackle, greasy apartments and discourteous old manager doing business on the rowdy plan.

The manner in which this honest old farmer got his goods, has its counterpart in every town in which a grange store exists. Baits are held out all the time to those likely to deal at the grange store. From the description given, it is evident that the writer has no proper notion of what a genuine grange agency is. The firm described as such, consisted of nothing more or less than a man or two hired by the merchants of Memphis to take the grange custom and turn it over to them. While it is a fact that wagons can be bought at grange agencies for $10 to $20 less than at retail, it is foolish to suppose sewing machines can be had there for less than the cost of manufacture. No shrewd farmer will bite at such greasy bait as the Memphis agency presents. As to middlemen, I would refer the RURAL readers to issue of March 9th, page 156, "Remedy for Unjust Weights" to learn the exactions and peculations to which they are in the habit of subjecting the farming community. As to whether the Memphis agency is an exceptional one, that it is so can be learned by comparing it with a grange agency proper, one of which we have at St. Louis, Mo. The officers of such an institution are appointed and paid by the State grange of the State in which it does business. All parties patronizing it, get their purchasing done for nothing. There is no commission charged, no bummer fee, such as that received in Memphis. The agent buys for cash and at wholesale any thing a patron may want, from a case of needles to a steam engine, and secures for the purchaser a discount on regular wholesale price, nearly or quite sufficient to pay freight. Instead of buying, as was formerly done, on a small scale for granges, the farmers are organizing co-operative stores, each one taking so much stock as times will admit. Ten per cent per annum is paid on the stock, and the patrons get a dividend out of profits, according to the amount of their purchases.

Every man has a right to protect himself against any invasion of his rights. The farmer has been in the hands of the middleman for scores of years, nay, for ages. He has taken what he could get for his products, often at short weights, and paid the merchant his own price for goods, by the same weight or measure. This kind of traffic has had its day, and must cease. The farmer has learned that he can ship produce as well as dealers, and does so when city prices will pay expenses and leave a small margin over home trade. The most intolerable thing connected with the grange movement is that the farmer, the feeder of the nation, the man that supports all manner of manufacturing industries in this great country, as well as nearly all its foreign and most of its domestic commerce, should have the impudence and audacity to set up a store of his own, solely for his own benefit in buying and selling. This outrage in the eyes of grumblers, is beyond all precedent, and ought not for a moment be tolerated. The farmer outside the grange, has the power to do business through proper organizations, without using middlemen; but will he use this power? For these grange facilities are open to all farmers as far as selling and wholesale purchasing are concerned, and are not limited, as many suppose, to patrons.

FARMER.

Kirksville, Adair Co., Mo., Aug. 10, 1878.

NOTES FROM THE RURAL GROUNDS.

THE OTHER SIDE OF HYDRANGEA PANICULATA GRANDIFLORA.

ONE would suppose that this plant would be happy in England, for it loves a weeping atmosphere and abominates a fervent sun; yet more is said of it here than there. The RURAL has praised this shrub from the beginning; praised it while yet it had few friends. Now that it has many friends and bids fair to find a place in every garden, we think we may venture to speak of its faults. First of all, it is heartless. It is false. Its flowers are odorless and sterile. The great panicles which they form have scarcely one of the qualities or attributes which one admires in flowers. They are great unbalanced, conical heads of color, first of a greenish tint, then nearly white, then, as they fade, a faded, tissuey rose color. Every stem bears one of these half-capsized panicles which, in suitable soils, will measure at least two feet in circumference.* As the pliable stems are not strong enough to support them, the panicles bend over upon the grass or earth, forming disordered masses of white or rose that, after a season or so, quite fail to excite any sense of pleasure. The leaves too are thin, papery, coarse, weedy and they droop upon the stem during hot sunshine, giving to the plants a more than over top-heavy, undressed, overburdened appearance.

This Hydrangea in seasons of drought or in sandy soils is an out-and-out failure. The leaves wilt and droop as we have described, and the panicles dwindle to the size of a teacup. These are its faults.

We have been sincere in all we have said in its praise. The new and half-mysterious is looked upon with partial eyes. Hydrangea paniculata is perfectly hardy—a rank grower. It blooms at a season when shrub-flowers are rare and its banks of bloom are showy though not pretty. It is readily propagated from cuttings of the roots or of the half-ripened stems. These are its merits. To those to whom this Hydrangea has become commonplace, we think the above is a fair estimate of its bad and good qualities.

* We have just measured one 31 inches in circumference at base.

PLUMBAGO LARPENTÆ.

One rarely hears this spoken of. It is not quite hardy in this climate, though it has lived with us during the two years past without protection. Still, protection of the roots would be needed during severe winters. It grows about a foot high. The leaves are thickly set, about the size of hardy Phlox though more obovate. The flowers which resemble those of Phlox, are borne in spicate heads and of an indigo-blue color, finally becoming violet. It is fall-blooming, herbaceous and desirable for the color of the flowers, if for no other reason.

TO THOSE WHO ARE LOOKING ABOUT FOR HOMES.

IF we were again to select a home, it would never be in a narrow valley running north and south. All plants hardy enough to endure the climate, thrive here luxuriantly, it is true, and this has served to lessen our discontent in the face of many serious drawbacks. After nightfall the air is laden with moisture so that from this time until the sun gets well up in the morning, the grass is as wet with dew as if a shower were falling.

Our neighbors told us six years ago, when we were about to purchase the land, that chills and fever was unknown in this neighborhood. We knew of families that had lived here for eight years. We saw their children running about with uncovered heads late at night and early in the morning, and they seemed healthy. A venerable resident explained to us that he and his father had occupied the same house for upwards of a century, and, said he, "a case of chills and fever has never been known in our family." We believed these statements, purchased the land, erected our buildings, laid out and planted the grounds. For three years there was no reason to doubt the statements of our neighbors. With entire unconcern we enjoyed the night and morning air freely. No neighbor uttered a warning word. We heard of "malarial fevers" near us on the right and on the left; but still confidently believed that *here*—within a little charmed space—the air was proof against malarial taint. Since that time three of our family have been prostrated with this most insidious, most unrelenting and deceptive disease.

"It is everywhere," is our consolation from the neighbors. We are aware that malarial fevers have prevailed during the past season to an almost unparalleled extent, and that, too, in districts to which the disease is an entire or comparative stranger. But we are also aware that it cannot be truthfully said that *this* locality is, as a rule, free from the scourge.

We have written the above, not to condemn our beautiful home, surely; not to condemn those of our neighbors who assured us of what, no doubt, they must have known to be false—but for the purpose of impressing upon such of our readers as contemplate selecting new homes, the necessity of exceeding diligence in ascertaining the healthfulness of the proposed district. There are locations which are exempt from malarial air and though there are few exempt from all objectionable characteristics, yet the prevalence of this disease would, in our estimation, at once condemn any place, no matter what might be its other advantages.

Bergen Co., N. J.

WHAT OTHERS SAY.

HOW AGRICULTURAL PAPERS BENEFIT THE FARMER.—The following is a part of an admirable address by Conrad Wilson, before the Farmers' Club of this city:

So clearly and palpably have the journals of this class demonstrated their value that it is often possible in passing through a rural district to discover, by unmistakable signs, the farms at which such papers are taken and where they have found a welcome home, and it is easy to see that in the presence of these sheets of useful knowledge the whole aspect of the farm is changed and all the results improved. Manures and fertilizers are more efficient, as well as more abundant, the latest and best methods are adopted, a new impulse is given to vegetation, the very roots of the crop strike deeper and spread wider than before, and even the meadows assume a brighter shade of green and the cereal grains a deeper tinge of gold. And finally, as a crowning evidence of what is here claimed for the influence of the press, along with this new vigor of vegetation and more abundant yield, we find also a reduction of cost that is even more important than all the rest.

It would be easy to refer by name, if it were not invidious, to a score of such papers, in either of which a single number could be pointed out which for intrinsic value is worth to a shrewd farmer the subscription of a lifetime. Even single passages could be referred to in various journals, in which the facts comprised in a few lines are worth more to an intelligent, practical man than a ton of guano or an acre of land, for the acre of land is confined to one unchanging spot and the ton of guano admits of only one application. But the great facts of experience in farming are not bounded by an acre and do not expire in one application. On the contrary, they are developed by use and grow by repetition. They spread and multiply from farm to farm and from year to year, until a continent is made richer by them and posterity hails them as a treasure.

The timidity shown by many in applying a sum so ridiculous as $2 or $3 to obtain the priceless knowledge on which depend the whole value and final profit of their business is more than surprising. The trifling sums often lavished without a thought on objects of comparatively no value, if applied to such a purpose as this, would be sufficient to supply a variety of journals and valuable books that would at once create a new atmosphere of thought in the house, and while thus rounding out the education of the family, would also enlarge the yield and the profit of harvests to come.

PROTECTION TO ROSE BUSHES.—Speaking of this, H. S. says, in Country Gentleman, that evergreen boughs or corn-stalks make an excellent covering, which should be loose and open, admitting air but preventing alternate thawing and freezing. Peter Henderson's advice, to cover with sods, has destroyed the hopes of hundreds of Rose-growers by killing their plants. He knows of many who regret following this advice. Air must be given or the plants will die.

[It seems that many do not understand that the object of what is termed "protection" to plants, is not to keep them warm. It is rather to keep them cold, though not for that either. It is to protect against the wind, the sun, and sudden changes of temperature. There is nothing better than evergreen boughs; but when these are not easily obtainable, long manure thrown lightly over the beds and held there by sticks stuck diagonally, or any light substance, will answer just as well.—EDS.]

SOCIAL LIFE ON THE FARM.—The population of the hill-towns and by-places is concentrating in the marts of business, not because the soil of the farms is exhausted, or because farming does not pay, but mainly because the craving for social life is not satisfied. Even our Patricks and Bridgets are refusing to live in the country because they have no society there, no Catholic church at which they can meet and have a "nate" social time, no bar-room in which they can "trate their frinds," and no balls at which they can show off their "ilegant" figures and fixtures. This is not the style of social life which is the most desirable for city or country, but it shows that more society is the want of the farm.—*Alex. Hyde, in N. Y. Times.*

[Strange reasoning this! We do not want any "Bridgets" on the farm, or "Patricks" either, who are dissatisfied because there is "no society." The time is not far distant when Americans will deem it no disgrace to do Patricks' and Bridgets' work, and be glad of the opportunity. There is as much "society" on the farm as there has ever been, and as much as is compatible with health, industry, and morality.—EDS.]

A NEW WORLD.—It is not surprising says the conscientious editor of the Weekly Tribune that a thoughtful man—like, for example, Mr. Alfred Smith, our venerable correspondent at Monmouth Me—should be able to say (as he does in a private note just now opportunely at hand) that since giving special attention (after his sixtieth year) to the study of Nature and her wonderful ways and works, he "seems to be in a new world." He wishes others to "taste and see," and declares that if farmers generally would take time for such delightful recreation, it would show the universe to be a wonderland indeed, and "lead the thought from Nature up to Nature's God."

SEED POTATOES.—J. Rhodes remarked, at a late meeting of the Elmira Farmers' Club, that he planted pieces and whole potatoes last spring in rows, side by side, and when the tops were up six inches, he could see a great difference in favor of those growing from the whole potatoes. The difference could be seen plainly by an observer, thirty rods distant. At the digging, he found he had to go as far to get a bushel in the rows planted with pieces as to get a bushel and a half in the others.

WHEN TO SELL POTATOES.—Charles Heller thinks if he had a crop of potatoes to sell, and could get fifty cents from the field, he would never hesitate about selling. Supposing potatoes to keep without wasting, he thinks fifty cents as good in the fall as seventy-five cents in the spring.—*Elmira Farmers' Club.*

WHEAT SEEDING.—The London Agricultural Gazette says that upon clay lands we can scarcely be too early and on light soils we may easily be too late. The first week in September is a favorite time with some heavy-land farmers, and the present month may even be employed in sowing this important crop on clay lands where the previous cropping renders such a course possible. By early sowing, a strongly-rooted plant is insured before winter, and even less than six pecks of seeds per acre will prove a full seeding.

HARMONY IN THE COUNTRY HOME.—"A wise man, when he plans a country residence, will so apportion his means that his house may not be out of keeping with his grounds. The same style—the same feeling should pervade both and be reflected from one to the other."—*A. J. Downing.*

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY SEPT. 28, 1878.

IN a few weeks we shall issue the RURAL with a new design for a heading, more in keeping with its present widened columns as well as with the modern aspect of the departments of rural life, the interests of which THE RURAL NEW-YORKER is earnestly striving to advance

WE call attention to the second series of seed tests by Professor W. J. BEAL, the first of which, published last spring, excited a deal of interest all over the country. A third series will follow next week.

THE original architectural designs presented this week will, we trust, prove of special value to those intending to build tasteful dwellings at a small expense.

VALUE OF THE CORN CROP TO THE SMALL FARMER.

A LARGE number of farms, especially in the North and East, are under fifty acres. If we exclude woodland and land not arable, more than half the farms in New England are under twenty-five acres in extent. It is singular that it should have been taught by many agricultural writers, and still more singular that farmers themselves should hold the belief, that corn is not a crop for small farmers to grow.

Without saying that no man should follow a specialty in agriculture, we are firmly convinced that mixed farming is the most profitable for the greater number of American farmers, whether their holdings are large or small; and among the crops that no farmer can afford to dispense with is the corn crop. We may make the "exception which proves the rule" in behalf of farmers on heavy clays, where grass and small grains—unhoed crops—are in a great degree necessitated. The farming of that kind of land is a specialty by the fiat of nature. But on all loamy and sandy farms corn-growing is practicable; and, when followed with skill, it is eminently a profitable crop.

There is no way in which so much live-stock can be kept from so small an area of land as by making corn the main feeding crop. If a man is to feed ten cows from ten acres, the year around, he must depend upon the corn crop as his main reliance to do it. This, and rye as an early soiling crop, with a field of clover and orchard-grass to bridge the time between the rye and the early fodder-corn, make a complete round of feeding material—the rye to be turned under as soon as the clover field is ready to cut, and the land to be then planted to roots. Three-fourths of an acre of corn will keep a cow a year, and keep her well; but we would not recommend it as the best way to keep a number of cows, or even one cow. We would make corn the main crop, but not the only one, for various obvious reasons—the principal one being that we should have no green feed early in the season. Rye and clover—with orchard-grass—and from 50 to 100 bushels of roots to each cow, ought to be grown.

The chief objection to corn-growing among most farmers is that there is too much work about it. But, rightly handled, there is no crop more easily grown, for its value, than corn. There is no need of using any hand implement in its cultivation. The corn-planter, the smoothing harrow and the horse-hoe will do all the work better than it can be done by hand. Husking and shelling are dreaded jobs, and the curing and handling of a large crop of fodder-corn is a heavy task in the eyes of many; but knowledge and skill lighten labor, and it is worth while for every farmer to master the art of handling corn, either for grain or fodder, in the quickest and cheapest manner It is the great American crop. When we make the right and full use of it, it throws out of agricultural competition with us any country where it can not be grown, no matter how otherwise it may be favored in soil, climate or productions.

SOCIAL CULTURE.

IT has been the fashion to complain of the dreary isolation of dwellers in rural localities. But the complaints have been made most frequently by those who are entire strangers to the matters upon which they write so freely. Country folks are in general so fully occupied with affairs that they have no time to discover how lonesome they really are. So far as this is concerned we think it a misfortune. We are too busy. We work too hard. We take few or no holidays. We read and think too little, and do not spend sufficient time in social culture. There is no reason why those who plow the soil, or "whose talk is of bullocks," should not experience the refinements which are the result of formal social life. In business, at bargains, in pursuit of dollars, no man is seen at his best. He is thorny, spiny, with his back up as a porcupine might be at *his* business. Let one doff his working clothes and enter a room full of his neighbors—men, women, young men and maidens—and he is a man of another kind. He naturally falls into the ways of an intuitive kindness, which is really the truest politeness; the doing to his companion what he would that he should do to him. He "lets himself out" to please, and, after an evening spent in social converse, he retires with many rough corners and asperities toned down. For a few days the influence remains. It would be permanent if it could be reinforced now and then, and the good results would be most agreeable and useful. There is no difficulty in bringing these good influences to bear. Two or three persons, with energy and some magnetism about them, can put them in motion with ease. Now is the time to begin the effort. A book club is one excellent means to effect it. A mutual improvement association is another. These two naturally grow out of, and belong to each other. They are quite enough for a beginning. Let a dozen persons, or less or more, each name a book or a magazine and subscribe the money to purchase them. Each of these books is made to go the rounds of the members; so that for the price of one book each member has the reading of several, and, at the end, may possess this book permanently; or, the books may be sold and the money applied to the purchase of new ones. Every week let these people meet, and talk over and discuss some question of interest to them all, which one has made a special study of for the purpose of introducing it. Or let those who have a taste for it, entertain the others with a reading of selections, poems, or a well chosen drama or play. The book club and the improvement association are then started, and once the ice is broken, will float along smoothly and pleasantly.

OUR INVENTIVE GENIUS.

Necessity *was* the mother of invention. It is now no more so. The genius of America is an inventive one, and is not now stimulated into action by necessity, whatever may once have been the case. We have changed all that. Now, we invent something, and then seek a use for it. The use is generally found very soon. It is something to cause us to feel very complacent, that a whole army of inventors are engaged in puzzling their brains to find out some new thing. This is an old business. The ancient Athenians spent their time in the same pursuit, but not nearly so successfully as we do now. They had no patent office that we ever heard of; and ours is a great help to us; if only to store up the ideas that are waiting for the necessity. It is now that the old adage is reversed. Invention is the mother of necessity; and we discover a device first, and then seek a use for it. It is only a poor week's work for the patent office, to issue about 300 patents. That is 15,000 in a year. The last patent issued is numbered somewhere about 205,000. If these owed their origin to necessity, we should be the most necessitous people in the world. But it is otherwise. In every country, Americans are known as the most prolific inventors; and American devices enter into almost every house that boasts a window-fastening or a door-latch. But a thing or two are yet needful. We want a good potato harvester; a machine that will harvest corn; one that will pick cotton; another to pick up turnips; one to cut fodder, and elevate it above the feed rooms; and several other handy affairs that we can tell of when those are furnished. Let inventors note these wants.

HONEST FRUIT PACKING.

DIOGENES went hunting about the streets, seeking for an honest man in the middle of the day, with a lantern. If we were looking for an honest fruit-grower, we should seek for him in the middle of his peach-baskets and apple barrels. Notwithstanding the vast amount of preaching on this subject, hardly one fruit-grower in ten has yet found out the money profit of honest packing, because they have never tried it.

Men expect to be cheated when they buy fruit in the original packages. But the astonishment and delight they experience on emptying a basket or barrel and finding it of equal quality all through—and especially when, after buying again and again of the same grower, they meet the same experience every time—is such that they will submit to very high rates to get that man's fruit. It is true that there may be a loss on the first shipments of honestly-packed fruit, but just as soon as the reputation of a brand is established—and it does not take long—the reward of such honesty—or let us call it good business sense—begins to come in abundantly.

The rule of honest assortment should hold good even if, as in some years, not one package in ten can be branded "No. 1." The scarcer such packages are, the bigger the price they will bring. This kind of packing also has a direct tendency to make better fruit-growers. A man who has had the pleasure of receiving an account of sales, in which his No. 1 apples are figured at $5 and his No. 2's at $2, will try and increase the quantity of No. 1's by manuring his orchard, pruning his trees, and keeping down the insects that weaken the trees and disfigure the fruit. It is most emphatically true in the fruit business, that honesty is the best policy, every way.

THEMSELVES, NOT THEIR SUBJECT.

If any man is working with the single object of advancing the best interests of any branch of industry or science, he is the first to recognize efforts in the same direction, made by others. Light shed upon that department of industry or science, is in his eyes glowing, let it come from whatsoever source it may.

Dr. Sturtevant says: "One of the discouraging features of agricultural progress is the disinclination among our prominent men to speak favorably of others working in the same field." The reason is, as it appears to us, that where there is one "prominent" man who places the good of agriculture above self, there are at least a dozen who use agriculture as a sort of dung-hill, upon which they are to perch themselves and crow, and they jealously imagine that any praise bestowed on other toilers in the same field, will detract from the applause they hope to receive from their own labors. They had rather rule in hell, than serve in heaven, and a misgiving may be entertained that many of them will have the opportunity, one day, of a surfeit of their preference.

A Transatlantic Moan.—The 13,000,000 quarters or 104,000,000 bushels of wheat, which the Pall Mall Gazette now acknowledges to be a low estimate for the deficiency which Great Britain will have to supply this year from foreign sources, will cost at current market prices, £30,000,000 or in the close neighborhood of $150,000,000. Thus for one article of food alone our transatlantic cousins will have to pay at the rate of nearly five dollars per head to foreign growers. Yet it is conceded that they will in this way obtain the supply far cheaper than if they attempted to grow it at home, even if so large an amount could be profitably grown on the small area of the British Isles. It is a fruitful ground of complaint with them, however, that the two principal sources of supply—America and Russia—should both show an increasing disinclination to be paid for their exports of food in manufactured articles. The vast improvements lately made in our various manufactures—or as the English prefer to say, our protective policy—have almost destroyed their trade with this country in iron-ware and cotton fabrics and seriously injured other branches of traffic, and it extorts a moan from the neighborhood of John Bull's pocket that henceforth he must pay for the food imported from this country, out of the profits made in other directions instead of by an interchange of productions.

BREVITIES.

WE call the intending bee-keeper's attention to the little statement of Mr. C. C. Georgeson, of Michigan.

WE have just (Sept. 22,) cut off a flowering spike of Pearl Millet, that measures 13½ inches in length, and four inches in circumference.

THE ETERNAL FITNESS OF THINGS.—There is nothing more appropriately neat and natty than a pretty little cap on a pretty little French *bonne*. Put the same cap on a coarse, overgrown pug-nosed Irish nurse and see how it looks!

THE careful, thoughtful prudent man is sure to be rewarded in the long run, while recklessness and want of prudence, although missing disaster again, and again are tolerably certain to come to grief in time.

THE season of planting tulips, hyacinths, etc., is now at hand, and we advise those of our readers who can afford to do so, to buy a goodly assortment of each. Nothing is more beautiful in spring, than their varied and brilliant flowers.

IT would seem that there are few people who need quite so much instruction as the farmer; few who accept it more complacently—and it would further seem there are few who do not think themselves capable of instructing him. Ought we not to consider whether there is not some danger of farmers becoming "mad" from "too much learning?"

THE New Jersey State Horticultural Society will hold its first Annual Exhibition at Mount Holly, Burlington Co., in connection with the Burt Co. Agricultural Society, Oct. 8th, 9th and 10th. Our New Jersey readers should exert themselves to make this first exhibit of this Society a complete success. For premium lists, etc., address the Secretary, E. Williams, Mount Clair, N. J.

THE large importations of cattle and meat into Great Britain from the United States and Canada have not hitherto interfered in the least with the cattle trade carried on by Spain with that country. A late report by the British Consul at Cornuna shows that 20,730 fat oxen were shipped last year from that port alone for Portsmouth, Plymouth and Falmouth. Steam power is not used for the conveyance of these beasts, but small sailing vessels which are continually employed in the service, and it is seldom that any animals are lost on the voyage. A large quantity of eggs are also shipped at the same time.

ALL builders agree in this: The most economical form in which a dwelling can be erected is a cube, for the reason that it contains more space within a given area of wall and roof than any other. The irregular form has advantages in affording variety in the appearance both external and internal, while the different sizes of the rooms are better adapted to the needs of the family. The first or cubical form is best adapted when economy is a first consideration; the second when convenience and effect are first considered. Broad, projecting roofs protect against both beating storms and summer heat.

"It is not always easy" wrote A. J. Downing "even with very straightforward questions, to ascertain the character of a fever and ague district, though it is well known to the inhabitants. They strive to disguise it from others, and perhaps impose on themselves, very much for the same reason that a man strives to conceal his faults from himself, although they may be notorious to his neighbors. Besides this, old residents in districts slightly affected by malaria get acclimated, so that they are in a great measure insensible to its effects. But they are none the less dangerous to the new-comer, and frequently undermine a slender constitution that would otherwise have endured many years."

Literary Miscellany.

SURPRISE OF A GIRAFFE BY A LION.

In the hot, low countries of tropical Central Africa which are covered with the luxuriant growth of thorny Acacias, are found in small herds or families those peculiar ruminating animals whose wonderful appearance astonished the ancients.

Horace called them, not unjustly, a mixture of Camel and Leopard, whence the Romans have given them the name of Camelopardus or Camelopardalis. The animal appeared for the first time in Rome in the triumphal procession of victorious proconsuls returning home from Africa. Then it was placed in the menageries of the rich, and later it took part in the bloody contests of the arena, where the Romans took great delight in exposing him to the attacks of lions and other wild beasts.

In regard to his habits of life the Romans concerned themselves but little. On the other hand he Arabs, the later conquerors and settlers of Africa, paid great attention to this beautiful and most peculiar animal, and learned to know its gentleness and harmlessness. They named the animal "Dscheraf" the "loveable," the "gentle," and from this comes our Giraffe.

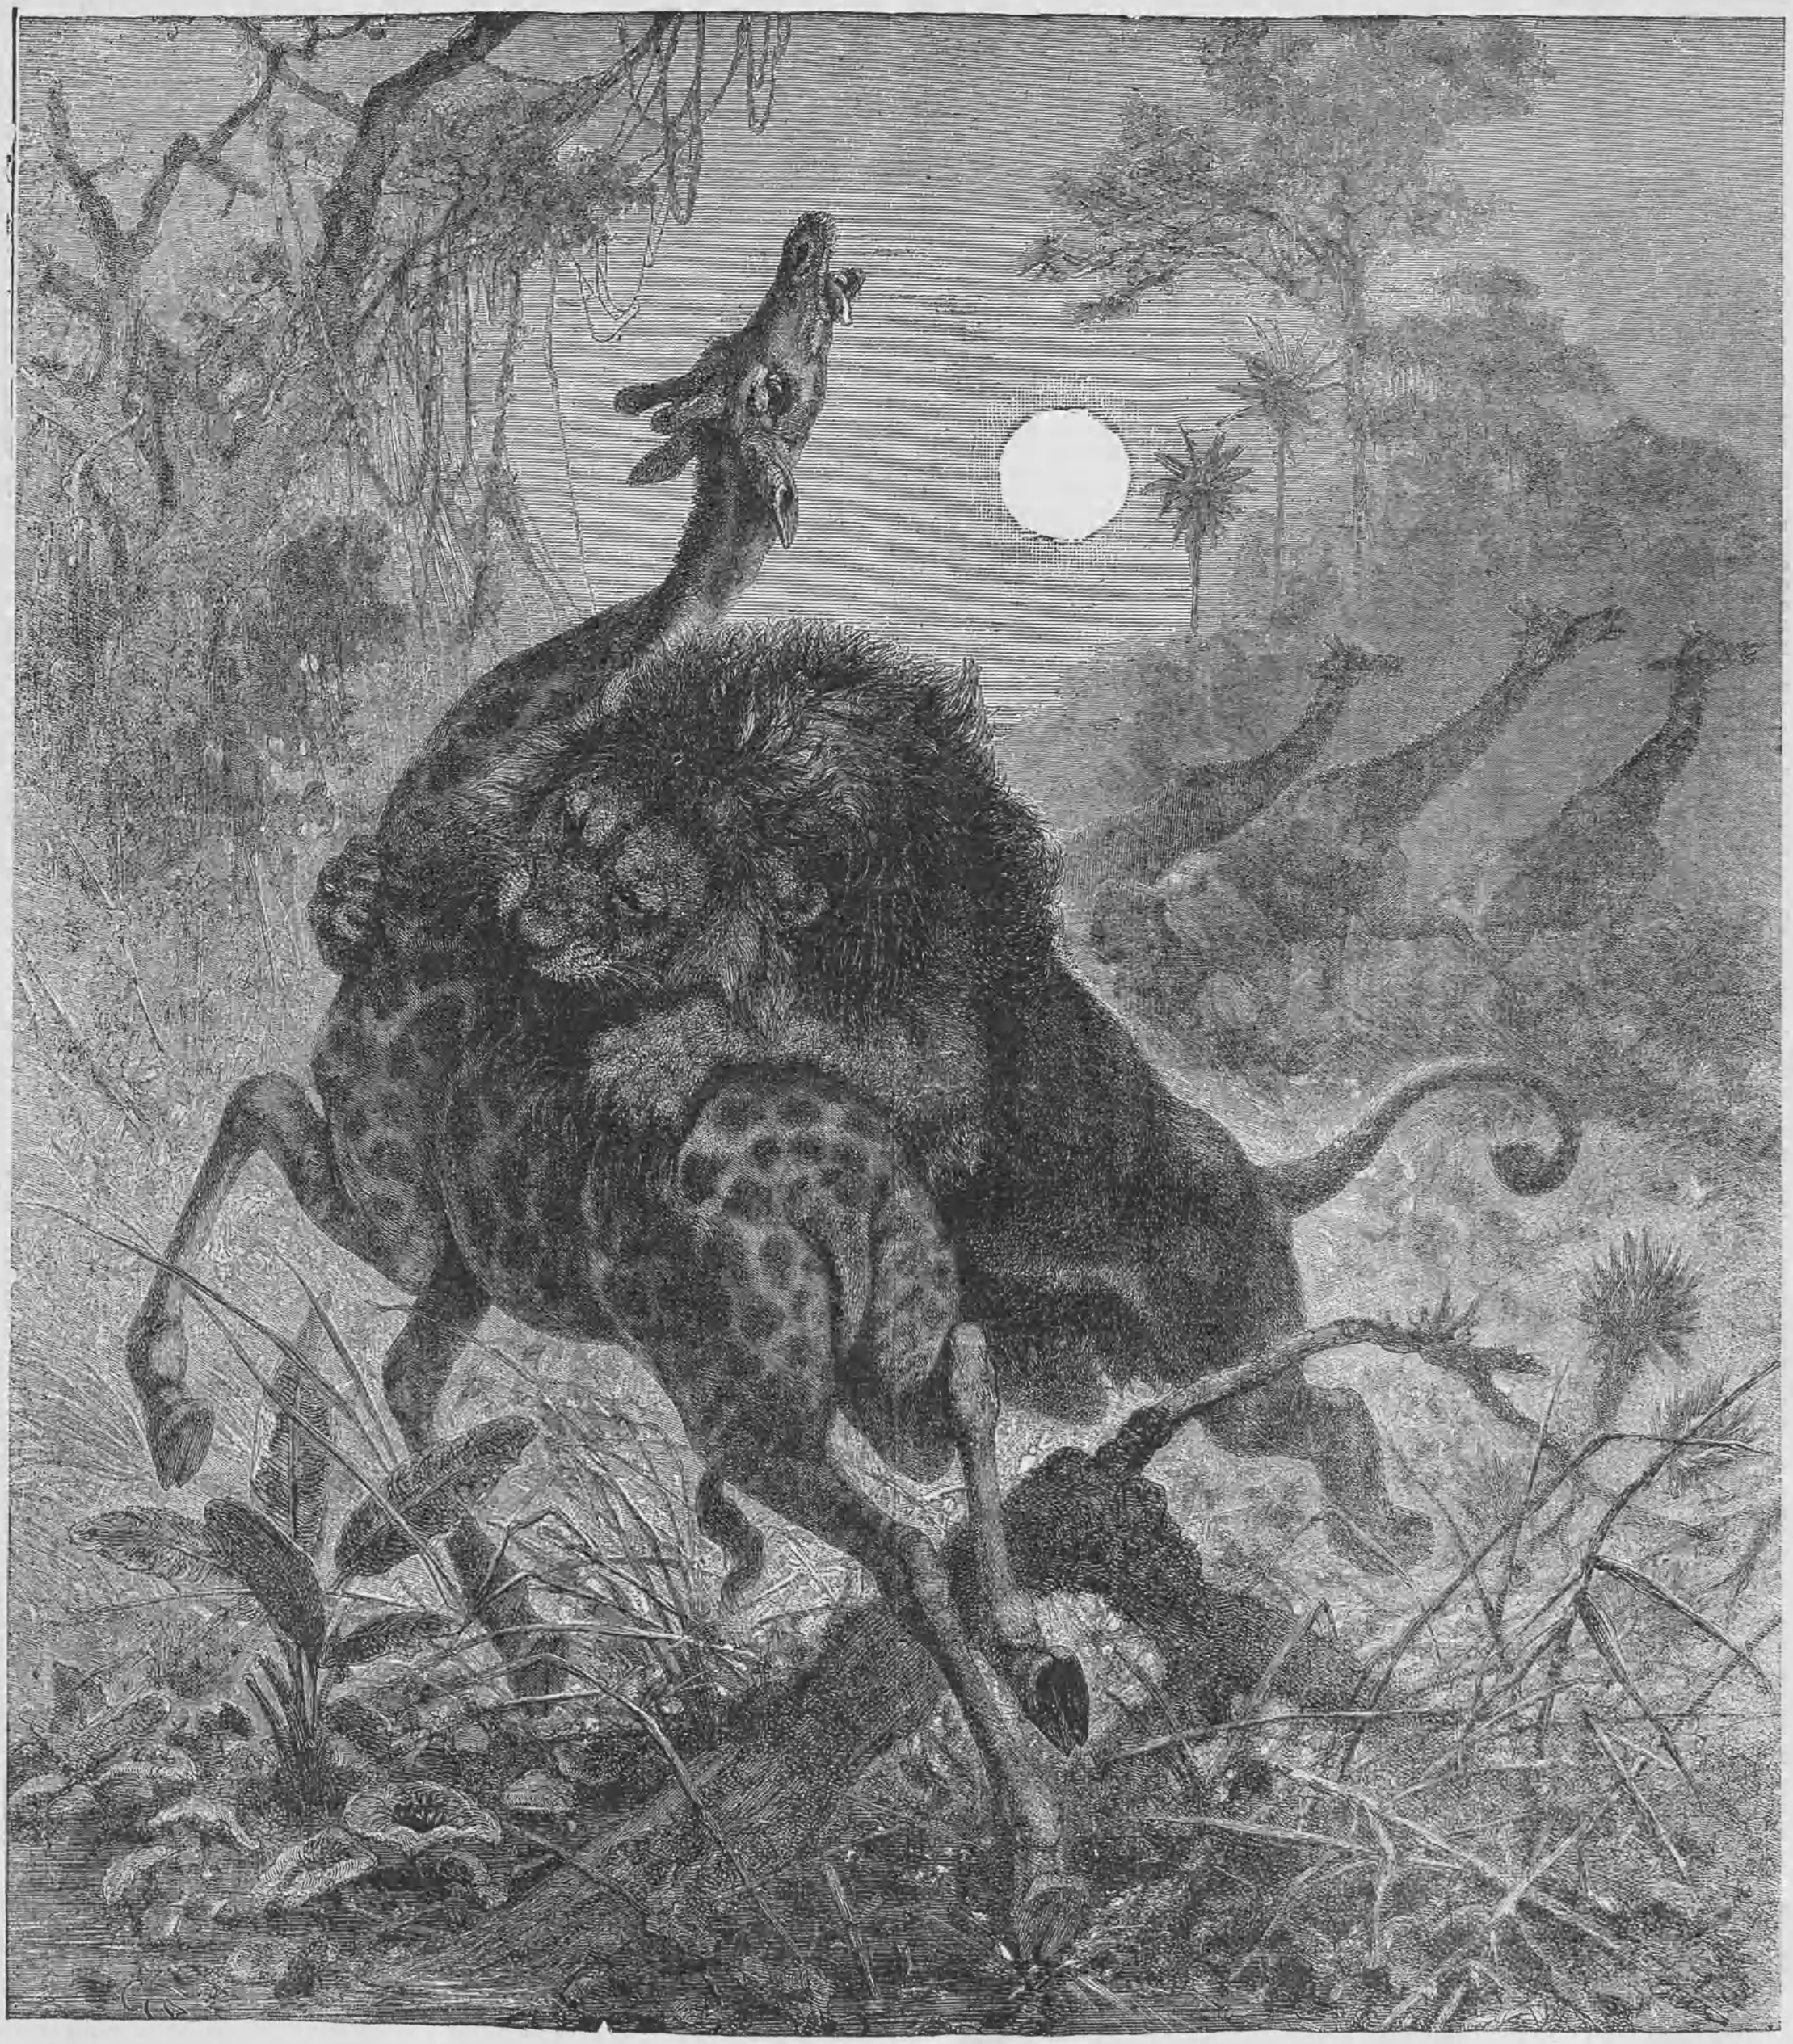
The Giraffe is essentially a forest animal, as in consequence of its hight and its peculiar form it is not able to feed on grasses, but lives principally on the leaves of trees, and especially those of the thorny Acacia.

In the Cape countries one kind of Acacia is called the Camel-thorn because the Giraffe, the Camel of the Boers, loves best to feed on it.

In the unexplored portions of the Acacian forests the giraffe lives in herds of from 8 to 10, and often more, and knows well how to protect itself against most of its foes, for it overlooks everything with its high head, and guards a large circle with its acute senses of sight and smell.

Its only dreaded enemy is the lion, the king of the forest who, when in his wanderings he discovers a herd of giraffes, calls into action all his craft, cunning and perseverance, in order to make a prey of some of the herd. The lion succeeds in this by aid of the shelter afforded him by the thickets and from concealment, springs upon the doomed beast, strikes his powerful claws into its shoulders, seizes its neck, and tries to pull it down. The poor giraffe collects its whole power now and endeavors, with desperate springs, to release itself from the persecutor on its back, as shown in our illustration. The other giraffes of the herd fly in terror, and the victim of the lion, after fruitless jumping and heavy loss of blood, yields, and is devoured by the lion and his whelps, who are as eager for the fine, delicate flesh of the giraffe as are the native tribes of Africa.

The English hunters also kill them in great numbers for the simple gratification of their love of sport, and the animal which used to be in herds of 40 or 50 is now rapidly disappearing.



A GIRAFFE SURPRISED BY A LYON.

RUSSIA AFTER THE TREATY.

It is felt that Russia has not attained her object, that she has been deceived by her friends, and that she has foolishly helped her enemies with her victories. * * * What is the reason of our failure? One-half per cent. of our population have perished in the war, hundreds of millions have been expended, and yet the Eastern question is not solved and the treaty of Berlin is merely a truce. The last war has clearly shown our national peculiarities as well as our moral and material strength. * * *. All the military requirements which depended on the inbred qualities of the Russian soldier were brilliantly carried out; but where knowledge and preparation were demanded we were not equal to the task. It was probably for this reason that we felt so much hurt on reading of the boldness of Lord Beaconsfield, who doubtless reckoned on the superior culture of Englishmen to that of Russians.

"All classes of Russian society are responsible for this; we do not estimate culture and knowledge at their true value. Most of us say that mental work does not bring money, and that culture is a means of corruption. * * * In Western Europe, on the other hand, people have arrived by hard experience at the conviction that intelligence, capacity, culture and energy bring men to the front, and give them peace at home and power abroad. It is the knowledge of how to make the best possible use of their energy and abilities that has enabled the English to derive success from our victories and sacrifices. May this be a warning to us!"—*The Golos.*

The Moscow correspondent of the Cologne Gazette says that it is the general opinion in Russia, that under present circumstances a reduction of the army would not be desirable, as such a

course would strengthen the belief prevailing in Europe that Russia has made concessions because she is weak; besides which, the expense of a disarmament, to be perhaps even followed by a mobilization, would be greater than if the army remained on a war footing.

MY COUSIN ADELAIDE.

"MAB, Mab, when will you be ready?" cried Nellie, bursting into my room one afternoon, attired for riding.

"Ready? I am ready now," I answered from my station before the looking-glass; and having given a finishing touch to the natty red bow at my collar, I caught up my skirt in one hand and my gloves in another, and ran down after her.

Mamma was in the drawing-room with Sir Percy Barton, and as we entered was asking him to return to dinner.

"I expect my niece, Miss Graham, to arrive while you are out. We have not seen her for many years, but I hear that she is exceedingly beautiful."

"Indeed!" he rejoined; carelessly adding, "I shall be very pleased to accept your kind invitation."

During the ride papa and Nellie kept together and Sir Percy maintained his usual position at my side.

"Has Miss Graham come?" I inquired, as I dismounted, and ran up the steps into the hall.

"Yes, miss," answered solemn Beale; "she is in her room now."

The dressing-bell had rung some time, so Nellie and I hastened away to array ourselves in our simple muslins.

My toilet was speedily completed, and I hurried off to make acquaintance with my cousin.

"Come in," said a musical voice, in response to my impatient knock.

An eager welcome was on my lips, but at sight of the face and form that moved slowly from the dressing-table, my previous ideas of a good hug and a hearty kiss suddenly vanished, and instead I stammered out a few words of polite commonplace greeting.

No wonder that I was amazed and bewildered at first beholding Adelaide Graham. A figure faultless in its proportions and undulating curves; a face without one blemishing feature to mar its perfection, and hair like threads of living gold, arranged in a fashion unique, but marvellously becoming. Such was the *tout ensemble* of my lovely cousin; and as I blundered through a few questions relative to her journey and fatigue, a pang shot through me at the contrast of my own plain appearance and the surpassing attractiveness of the fair vision before me—a vision radiant in sea-green silk and ornaments of pearls.

It was with a quickly-repressed and almost imperceptable start of surprised admiration that Sir Percy bowed in acknowledgment of mamma's brief introduction, for even as Adelaide, stately and self-possessed, swept into the drawing-room the gong sounded.

After dinner, while the gentlemen lingered over their wine, she amused us by an account of a visit to Egypt, from which country she had but lately returned.

"Your descriptive powers are worthy of their grand subject," observed Sir Percy, who had joined us unperceived in the twilight, as Adelaide paused. "I can pay you no higher compliment, Miss Graham."

"And I desire none," she returned, slightly moving her dress, so as to leave vacant a place on the lounge. "You have been in Africa, then?"

"Yes," he replied, seating himself. "It is the correct thing, is it not, now-a-days, to extend one's travels beyond the Continent?"

"I should not have imagined you so rigidly obedient to the decrees of society as to travel merely for the sake of being in the fashion."

"Should you not? But I did not say that that was my reason for going. I only remarked, I think that it was proper to do so."

Both possessed quick, ready wit, and the gay ball of badinage was tossed merrily from one to the other.

Unnoticed I stole away to the piano, and began softly playing over some old-fashioned airs.

Presently there was a rustle of silken garments, and two jewelled hands fell lightly on my shoulders, and turning, I saw my cousin standing behind me.

Instantly I sprang up.

"No, no; go on, dear."

"I don't care to play any more. Will you sing now, please? You do sing, I know."

She hesitated; but Sir Percy joining his entreaties to mine, with a half-smile she sat down.

Her fingers touched the keys lingeringly in the minor chords of a short prelude, then there burst forth a very flood of sweet sounds, and the air seemed instinct with the subtle power of a wondrous melody. Looking out on to the moonlit garden, I trembled at the fantastic visions my excited imagination conjured up as the wild, weird harmony rose and fell on the breathless stillness of the room.

"Are you cold?" whispered Sir Percy, coming to my side.

"No," I answered, for it seemed almost a profanation to speak.

He said nothing further, only stood by me quietly listening till the player rose.

He thanked her with evident pleasure, and they were soon engrossed in an animated discussion as to the relative merits of various musical celebrities.

My first act when I reached my chamber that night was to walk up to the long mirror and take a deliberate survey of myself therein.

The result was not altogether satisfactory.

"A small figure, dark hair and eyes, a brown skin, and shapely hands and feet. That's about a truthful inventory of my personal possessions,' I ejaculated, with a sigh.

The summer days passed on, but the joy that had grown with the June roses waned with the coming of the July lilies. The spell of enchantment that had rested on all the verdant, blossoming earth was broken, the hours dragged by wearily and slowly.

The reason of the change I did not, I would not own, even to myself. It was the sultry weather, I declared, when mamma commented on my pale cheeks, and this same assurance I applied as a salve to my own aching heart and wounded pride, reiterating it afresh every time I saw Sir Percy's tawny moustache and Adelaide's blonde head in their frequent close proximity.

When he addressed me I answered with easy unconcern; when he looked at me, looked back with unflinching steadfastness, smiled with never a twitch or tremble, and responded with frosty coldness when he endeavored to engage me in arguments which had made me burn with excited interest only a month before.

"Miss Mabel, I think you said you wished to read this book. Will you honor me by accepting it?"

Adelaide, papa, and I were going to visit some place of note in the neighborhood that Adelaide wanted to see, and Sir Percy had asked to be of the party.

I was waiting alone in the dining-room while the horses were being brought round.

"Thanks. You are very kind. What is it?" I inquired, nonchalantly, languidly holding out my hand.

"Tennyson's 'King Harold.' I understood you to say that you were anxious to see it."

"Did I? I really forget."

"I ordered it some time back, but there was a delay in getting it from London."

"I am sorry you took so much trouble. It is really very kind of you," and I carelessly laid the neatly tied-up package on a side-table without even attempting to open it, though I remembered well enough the enthusiastic desire I had expressed to read the work.

"Trouble! Kind!" he echoed with an impatient gesture. "Surely you must know"——

> "Men were deceivers ever,
> One foot on sea and one on shore,
> To one thing constant never."

sang a clear contralto voice, and the next instant Adelaide entered the room, smiling and radiant.

Our way lay between fields of ripening corn, past orchards in which the fruit was already beginning to blush beneath the sun's amorous kisses, and through a wood where the springy moss formed a pleasant contrast to the blinding dust of the high-road.

"Is it settled between them yet, do you know, my dear?" asked papa, who had been my companion from the commencement of the ride.

"Is what settled?" I inquired, not understanding the meaning of his question.

His answer was a sagacious nod in the direction of the couple in front, whose constant laughter showed they were proving each other good company.

"Oh!" I replied; "I have not heard."

My horse slipped on the moist sward, essayed to recover himself, and slipped again. The reins were jerked from my hands, and I was only conscious of a terrible sensation of falling, and of a sudden stinging pain.

When I awoke from what appeared to me a long sleep, I found myself supported in Sir Percy's arms, Adelaide bathing my face with water, and my father standing by, a look of helpless agony blanching his ruddy countenance.

"What has happened? Did I fall?" I stammered, attempting to stand.

"Don't move," commanded Adelaide. "We have sent Dickson to the nearest village for a conveyance, and he will be back directly. Here he comes too. Good Dickson!"

As soon as we reached home, in spite of my assertion that beyond a little headache and giddiness I was none the worse for the accident, mamma insisted on my at once retiring to my room, and with her own hands undressed me, forbidding me even to get up again. Dinner and a cup of fragrant hot tea being sent up to me.

At night, she had scarcely left me, with the last injunction to remain in bed the following morning till after breakfast, when the door was noiselessly opened and Adelaide appeared. Her bright fleecy hair was unbound, and fell in a silken shower to her waist, and she looked as beautiful in her *deshabille* and dressing-gown as ever she had done in the full luster of a ball-room.

"Mabel, I want a few minutes' quiet talk with you," she said, seating herself.

"What is it?" I faintly demanded, wondering whether I was to be made the recipient of any sentimental confidences on the subject to which papa had alluded in the morning.

"Why, I want to know what you mean by treating Sir Percy so badly?"

"Treating Sir Percy badly!" I echoed, in open-eyed astonishment.

"Yes," she rejoined, decisively, "treating Sir Percy badly. What do you mean by it, you naughty, cruel child?"

"Really I do not understand you," I rejoined, pride coming to my aid, and helping me to hide any further signs of surprise.

"Do you not? Then I will speak more plainly. Why are you so cold and disagreeable to him?"

Well, to be sure, this was too much. Did she think that because he was her admirer I was to treat him with fervid *empressement*. I turned my head on the pillow, and vouchsafed no reply.

She rose and bent over me.

"*Cherie*," she said, laying her fingers caressingly on my head, "did you think that there was anything between us? That he and I liked each other?"

"Yes," I faltered.

"My poor little coz, I was afraid that was it. But you are quite wrong, dear. I could whisper a very different story, but I doubt not he would prefer telling it himself. What, crying? Why what would aunt say if she knew? How she would scold me for exciting you; and I thought I would set your mistaken little mind at rest."

"So you have," I sobbed, throwing my arms round her neck; "only I am weak and foolish."

The next day I yielded a meek obedience to mamma's wishes, and allowed myself to be treated as an invalid till dinner-time. Then I affirmed my perfect convalescence, and my intention of spending the evening downstairs.

Accordingly, donning my simplest dress, and twisting my hair into one large, loose coil, I descended to the drawing-room. There I had scarcely finished declining my mother's offers of pillows, and cushions, and hassocks, when Sir Percy, who had come over to inquire after me, and had stayed to dinner, came into the room.

"I am glad to see that you are quite recovered," he said, approaching the window where I sat.

"Thank you."

"It is very nice out of doors; will you come for a stroll on the terrace?"

Mamma was going to interpose an objection, but Adelaide hastily answered for me.

"Certainly she will; it will do her good. Wait while I fetch a shawl."

In a moment she was back again with a wrap of her own, which she deftly twisted round my shoulders.

We walked the length of the terrace without speaking. When we reached the end I paused and leant against the stone balustrade over which clustered the purple-passion flowers. Above the shining stars gazed down with watchful light; the air was heavy with the rich perfume of the clematis; the trees swayed fitfully in the evening breeze, and the hum of countless insects sounded noisy and distinct in the sweet silence of the summer night.

I turned at last, but with a quick movement my companion stayed me.

"No, I cannot let you go till you have answered me a question."

"What question?" I summoned courage to ask, endeavoring to steady my shaking voice.

"My little Mab—my little love, can you not guess?"

"But—but I would rather be told," I murmured shyly.

* * * * * * *

"Good folks, do you know that you have been out more than half an hour, and that aunt is nearly frantic at the thought of the illness she is sure Mabel will have?"

A strong hand closed round my trembling fingers.

"Miss Graham, allow me to present to you the future Lady Barton.

"Sir Percy, allow me to offer you my sincere congratulations. Mab, dear, I will not increase the natural conceit of mankind by supposing that you have any cause for felicitations."

"There is but one way in which I can thank you for your good wishes," retorted my lover; and before Adelaide could even guess at his intention, he had stooped and kissed her cheeck.

With a blush and a laugh she threatened to defer her revenge till matrimony had properly subdued his sprit.

I have been married just two years, and am the proud mother of one bonny son whose strength of limb, power of lung, and beauty of person, form an unfailing source of rejoicing to his doting parents.

Next month Barton Court will be *en fete* in honor of a visit from that brilliant leader of society, the universally admired Countess of Feltdal, who, in spite of her riches and title, is, and always will be to me, simply dear Cousin Adelaide.

F. G.

BOBTAIL JOE.

CHRIS. AMMAN, JR.

THE subject of this sketch was a warhorse of the rebellion. Just when he entered the service is not known, but at the breaking out of the war he and his mate were already veterans in the service of Uncle Sam. He was attached to Gibbons Battery, which was assigned to our brigade at the reorganization of the army after the first Bull Run battle. Our acquaintance was more particularly with the battery, though in the drills of camp we were often brought in close proximity to the battery in supporting it in a brigade charge of the enemy. On these occasions we noticed the fire of these veteran battery horses, whose eyes flashed and nostrils dilated and quivered from the excitement aroused by the quick changes of positions and the belching of the cannon in rapid succession to sustain a position or hew away the columns of the the advancing imaginary enemy, usually some companion brigade of infantry.

At the second battle of Bull Run this battery was called into some close work in holding important positions. On the last day it got in between a cross-fire and suffered a great loss in horses. Bob-tail Joe on that day got his name by having his tail cut neatly off and at the same time losing a part of his haunches, all being done in one fell swoop by a large piece of a shell, which had exploded over the battery and had caused death and destruction from its fragments. After withdrawing from position and taking up march for Washington, the wounded horse was allowed to wander at will. He would hunt up grazing grounds, feed all day, but return regularly every evening for his oats, which he partook of with his veteran mate, who came out of the battle unscathed. The battery boys would wash his wounds and the boys of the brigade would show him every attention until "Bobtail Joe" became a hero of the war, and was noticed in the letters which were written in camp to the folks at home. There was just lacking the power of speech to express his affection for the battery and brigade boys, for in every other way Bobtail Joe evinced it, and for his mate, who had now a new companion on the caisson, he would show an attachment that was touching in its tenderness and loyalty.

After the army of the Potamac was put in shape, commenced the march to intercept Lee's advance into Maryland. At South Mountains the battle in the mountains fired up Joe's war spirit; but he could not get up to the front, and all through the battle of Antietam he was not permitted to come near the field of action. His wounds were not healed, and being left to himself on the march he was not chafed by the harness or irritated by the heavy battery works.

The fierce, sanguinary Battle of Antietam was over, and the many brigades and batteries had gone into camp. The dead and wounded were being looked after by squads detailed for that purpose. The work was being continued into the night, which was lit up by a strong light from the moon. Joe wandered over the fields listening for the bugler's call, by which he could always find his battery, and in his perambulations came upon the very spot held by the battery during the fight. Squads were digging holes for the burial of the dead, but this was an old scene to the veteran horse. Perhaps he might have moved off unconcerned but for a plaintive neigh from a wounded horse. Joe listened with ears pricked up. It came again feebly. He was now all excitement, and moving up to the prostrate animal, Joe recognized his veteran mate, badly wounded and disabled for further service. The meeting was affecting and the grave-diggers who witnessed the scene, and who knew Joe and his battery, were moved to tears. Joe would put his head lovingly up to that of his mate and by soft neighs express his sorrow. It was not long when a couple of carbineers came along from patrol duty, and moved also by the piteous action of the wounded beast ended its sufferings. For days after this Joe wandered around expressing his sorrow by his indifference to food and the caresses of the battery men. He lost his wonted regularity and would be gone for some days and would be seen lying in the shade of some tree, indifferent to to the animation of the camps or the call of the bugle. When orders were at last received for renewal of the march to Richmond there was a stirring bustle in camp and the echoes were awakened by the shrill bugle and loud drum. Joe heard it and walked into camp. To honor this extreme loyalty to duty, the captain of the battery honored Joe by using him as "the captain's horse." Of course Joe felt deeply the honor of the position as he pranced at the head of the battery in the onward march, and though he had no tail to erect, he proudly arched his neck and tossed his head in the full measure of his pride, and that ends this tale.—*Detroit Free Press.*

THE LATE MEHEMET ALI.

MEHEMET ALI PACHA, whose assassination is announced in the cable dispatches, was, says the New York World, the ablest of the Turkish generals during the recent war. By birth he was a Prussian of French descent, his father being a staff trumpeter of the Nicholas Regiment of Cuirassiers of Brandenburg. Young Julius Detroy was placed in a business house at Magdeburg. But he was of an imaginative disposition, and soon tiring of business routine he ran away to Rostock, where he found a Mecklenburg brig getting ready for sea. The captain took him on board in the capacity of a ship-boy, and after a long voyage, of which young Detroy became heartily sick, the vessel anchored in the Bosphorus. He had had enough of the sea, and watching his opportunity he one day jumped overboard, and swam to a caique which was passing. Its occupant, who proved to be Ali Pacha, afterwards so famous, and grand vizier for many years, ordered the boy to be taken in, and was so pleased with him on a further acquaintance that he took him under his protection and even into his own family. Detroy, a year later, adopted the Mussulman religion and took the name of Mehemet Ali. His patron sent him to a military school, where he distinguished himself by his intelligence and good conduct. He received his commission in 1853 and made the campaign of the Danube against the Russians. He was first under fire at Silistria, and it was said that he did not seem very courageous. It has been even alleged by enemies that at the beginning of the bombardment he sought shelter in a cellar. But he soon gave proofs of intrepidity and even of daring, winning universal commendation. He once spent a whole night alone in a captured earthwork. Omar Pacha noticed the conduct of the young officer and placed him on his staff, and in this capacity he went through the Russian war, and, later, the campaigns in Montenegro, Arabia and Bosnia. He became a colonel in 1868, and in 1865 was made a pacha or general. He was employed with distinction during the insurrection in Crete and again on the Montenegrin frontier.

In 1873 he was given the chief command of the forces in Thessaly, in order to put an end to the excesses of the banditti, which had become intolerable. Mehemet Ali acquitted himself of this difficult task with great ability. Partly by artifice and partly by persuasion, by employing remorseless severity where "examples" were required, by daring attacks and by skillful operations in combination with the Greek detachments assigned for frontier duty, he was able in a short time to re-establish order in Thessaly. Toward the close of 1875 he was intrusted with the chief command at Novi-Bazar, a post of great strategic importance, and was afterwards engaged in various military duties in connection with the operations against the Servian insurgents.

At the outbreak of the recent war with Russia he was assigned to the command of one of the armies operating against the Montenegrins, Suleiman Pacha being at the head of the other. These two officers pressed the heroic mountaineers

hard, relieved Nicsic, and were said to be even threatening Prince Nicholas' capital when they were recalled to oppose the Russians, who were crossing the Danube. Mehemet Ali succeeded AbdulKerim, the former incompetent commander in-chief at the head of the Eastern Army, but was given no control over Suleiman in the west and Osman at Plevna. Mehemet Ali's battles with the army of the czarowitch generally proved inconclusive, and it is said that the jealousy between himself and Suleiman was due to the slaughter of the latter's troops in the desperate Shipka Pass struggle. Mehemet Ali afterwards attempted the relief of Plevna, but found it impossible at the late date of his effort to force his way through the Russian lines. In spite of his ill success, Mehemet came out of the war in better favor with his sovereign and people than when he entered it, while his rival, Suleiman, when last heard of, was in disgrace and chains

MAGAZINES.

DEMOREST'S MAGAZINE for October contains some very attractive designs for house and street costumes, besides much interesting information about fashions in general. The front page is adorned with an illustration in oil, entitled Unexpected Familiarity. There are, besides, two full-page steel engravings—one, Autumn Musings, the other, Fishing Boats; a Coast Scene; a showy tinted group of Autumn Leaves, and a fashion cut, illustrating a street costume and a riding habit. Country Kettle-drums is, as usual, a most attractive paper. What Women are Doing, Domestic Science, The Kitchen Correspondent Class, each and all of these departments are admirably conducted. Women, in all classes of society, whatever their occupations, will find in every number of this magazine many valuable hints.

ST. NICHOLAS FOR OCTOBER.—The October number of St. Nicholas opens with a very interesting story, The Violin Village, which carries us away to the mountains of the Tyrol, and tells the varied adventures of a bright young goat-boy of that region. The two serials, Under the Lilacs and Dab Kinzer, are brought to a happy close and there are several good, short stories, one of which, Mrs. Prinkins's Surprise, contains some additional exploits of Nimpo, whose Troubles interested the readers of St. Nicholas some years ago. The long-promised paper on Parlor Magic is given in this number, and the boys who wish to get up lively evening entertainments will be glad to see it. It contains plain and simple directions for the performance of many curious experiments. The French Alphabet, with twenty-six original pictures, also appears, and among other useful papers is one entitled How to Keep a Journal. Cutting the Pie, a humorous poem by Rossiter Johnson, will amuse the older boys and girls, while Happy Little Froggy will make everybody laugh. A Tale of Many Tails, and Prince Cucurbita are lively sketches, with pictures of novel design; and there are several very funny cuts scattered through the number. The Very Little Folks have a bright poem, Hare and Hounds, with a fine picture by Sheppard; and the departments are, as usual, well filled with good things.

SCRIBNER FOR OCTOBER.—The October Scribner opens with a twenty-page paper on the Art-Schools of New York, by W. C. Brownell, the art-editor of the New York World. A Company of Actors, by J. Brander Matthews, is an account of the leading theater of the world, the Comedie Francaise, with much anecdote and personal gossip. A Trip with Lincoln, Chase and Stanton, in 1862, is described by Gen. Egbert L. Viele. Artemus Ward at Cleveland, by C. C. Ruthrauff, shows the kindly as well as the eccentric side of the humorist, who was also a good deal of a practical joker. A laughable sketch of A. Ward and his Grate Show, and a view of him at work (both by George Hoyt in 1859), and his portrait and autograph are given with the paper. Leo Marinus, the Sea-King, by Henry W. Elliott, is an account of the sea-lion of Alaska. How Uncle Gabe Saved The Levee is a story of the Mississippi river by Wm. L. Murfree, Sr. Miss Calderon's German, a society story by W. H. Bishop, has drawings by the author. The serials are illustrated: Boyesen's Falconberg, by Mr. Dielman, who (the author says) has cleverly caught the Norse physiognomy; and Roxy (which comes to a conclusion in this number), by Mr. Shirlaw.

The unillustrated material comprises a second posthumous paper by Robert Dale Owen, on Texas and the Treaty of Guadalupe Hidalgo; a paper on Neophonography, by the inventor of the system, James Richardson, a short-hand writer of long experience; a sketch of College Journalism in America, by Charles F. Thwing, and an essay on Socialism, by Prof. W. G. Sumner of Yale College, who considers the historic origin and aims, fallacies and methods of the new movement. The poetry is contributed by Bret Harte, James T. McKay, Minnie Hay, Susan M. Spalding, Andrew B. Saxton, Henry S. Cornwell and Dora Road Goodale.

HARPER'S MAGAZINE FOR OCTOBER.—The two serial novels, by those great masters of fiction—Black and Hardy—will take the first place in the minds of the thousands of readers who are following these stories from month to month with intense interest. An equally numerous class of readers, turn to John Russell Young's terse and thrilling story of Stanley's journey through The Dark Continent, one of the illustrated articles in this Number.

A novelty in the way of illustration, is a reproduction of an old-time poem, Ye Bellman, by Robert Herrick, making a page-picture in Abbey's most characteristic style.

Three Thunderbolts is a humorous Southern character-sketch, by Lizzie W. Champney, with two powerful illustrations by Reinhart. The Western Ginevra is by Everett Hale. Little Miss Mouse and her Marvelous Scholar is by the author of Colonel Dunwoddie, Millionaire.

Adonais, by Will Wallace Harney, is an illustrated poem worthy of especial notice. Opening the Number, is a graphic description of a scientifically conducted stock and butter farm in New England. Another, contributed by S. M. Byers, our consul at Zurich describes a tunnel, now in process of construction beneath the Alps. Still another describes, with quaint illustrations, a Japanese mission-school. Of a more distinctively summer character are the articles on New York in Summer and Around the Peconics.

Butter Stores in Paris, by Marie Howland, is an interesting sketch, fitly supplementing the article on Echo Farm; and In a Jewish Book-store, by M. L. Marks, introduces the reader to some unfamiliar characters, as well as some very novel information.

Of the unillustrated poems, Meeting is a happy rendering from the Spanish, by Helen S. Conant; and Discord is a strong sonnet, from the pen of Richard Realf.

The Editor's Easy Chair treats of some especially timely topics, and the other editorial summaries are, as usual, well sustained.

LIPPINCOTT'S MAGAZINE for October contains two illustrated articles, one, The Paris Exposition of 1878, being a continuation of Mr. E. H. Knight's account of the fair. The two interesting serials are supplemented by a very charming short story by Robt. C. Meyers, and Lady Barker commences what promises to be a delightful correspondence in Letters From Mauritius. An Adventure In Cyprus, by Mr. Ker, is very filmy, but the poetry is fair, and the editorial departments sprightly.

BRIC-A-BRAC.

BRAINS.

An Epigram.

You argued in your lecture with persistence
Brains were not necessary to existence.
It may be so; and yet 'twas bold of you
To be the teacher and example too.

[*George Birdseye.*

HIS FIRST LOVE.

I remember
Meeting you
In September,
Sixty-two.
We were eating,
Both of us;
And the meeting
Happened thus:
Accidental,
On the road,
(Sentimental
Episode)
I wss gushing,
You were shy;
You were blushing—
So was I;
I was smitten,
So were you;
(All that's written
Here is true.)
Any money?
Not a bit.
Rather funny,
Wasn't it?
Vows we plighted—
Happy pair!
How delighted
People were!
But your father—
To be sure—
Thought it rather
Premature:
And your mother
Strange to say—
Was another
In the way.
What a heaven
Vanished then!
(You were seven,
I was ten,)
That was many
Years ago—
Don't let any-
Body know.

[*Balto. Every Saturday.*

A BEAUTIFUL SIMILE.

THIS rhyme
Is like the fair pearl necklace of the queen,
That burst in dancing, and the pearls were spilt;
Some lost, some stolen, some as relics kept.
But never more the same two sister pearls
Ran down the silken thread to caten each other
On her white neck. So is it with this rhyme.
It lives dispersedly in many hands,
And every minstrel sings it differently:
Yet is there one true line, the pearl of pearls:
"Man dreams of Fame, while woman wakes to love."

[*Tennyson.*

MOSKEET-HA!

By Ralph Alldough.

(Elmir's Son.)

If the mad slayer thinks he slays,
Or if he scrate'n to ease his pain,
He knows not well my subtle ways,—
I sting, and sing, and sting again.

I fill all places far and near,
Indoors and outdoors are the same·
The vanished wrigglers in me appear,
And in the dark I hunt my game.

They reckon ill who bar me out,
When me they fly I use my wings,
There is no peace when I'm about.—
Blood is the hymn the skeeter sings.

O rare and dainty is my food,
I sleep by day. I wake at even;
But thou, meek lover of the good,
Grease well thy nose and dream of heaven!

J. A. T., Transcript.

"DU BIST WIE EINE BLUME."

THOU art even as a flower is,
So gentle, and pure, and fair;
I gaze on thee, and sadness
Comes over my heart unaware.

I feel as though I should lay, sweet,
My hands on thy head, with a prayer
That God may keep thee alway, sweet,
As gentle, and pure, and fair!

[*Blackwood's Magazine.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SOUVENIRS.

BY JOHN MORAN.

A FADED rosette, a band
That gathered the gloss of her hair,
A glove from her flower-soft hand
And three written words: "*Mon plus cher.*"

A pansy she dropped in the dance,
A flutter of floss from her fan,
A programme she laid down by chance
When the foot-moving measure began!

All that is left for me: you please!
To smile at such trifles; to me
They waft a sad, fragrant breeze
From the isles of some outland sea.

She is here, even now, at my side,
My queen with the voice like a bird's,
In her lissome, unconscious pride
With her kiss that made pulses words.

She *was* here. Hush! If she be dead
Or false, what matter to you?
The old dews in the old days shed,
Fed roses, if also rue.

Rosette and ribbon lose sheen;
What worth is a worn, soiled glove?
The tenderest words oft mean
Betrayal and death to love.

The pansy no thought can save!
For those who forget its bloom:
The floss is as light as the wave
Of her sweet hand sealing hope's doom.

The programme! 'Tis true my name
Was frequently there, and yet
I have no hard words of blame;
It is well that she *could* forget.

But for some fleet, eminent hours
She said that she loved me best,
And that is the grace that dowers
The life of this—fool confessed.

TO THE LADIES.

IN the next number of the RURAL, "The Woman's Club," will have its second representation. I cordially invite contributions from all on any subject which can be of the least possible interest to women. I hope in time to induce a goodly number of our readers to send to the "Club" items from their personal experiences whether in the kitchen, parlor, store, schoolhouse or church.

It is desirable that this monthly interchange of ideas should be made of practical use to all, but without the hearty co-operation of the matrons and maids of the RURAL circle I can hardly hope to realize this desire. May I count on your aid?

FAITH RIPLEY.

MAGGIE'S PHILOSOPHY.

MRS. J. E. MC'C.

"THE hatefulest work a woman ever did," said Rose, as she plumped down the clothes-basket, filled to the brim, and commenced, rather peevishly, to assort the goods.

"I know of worse things to do than washing," said Cousin Maggie, who was helping her that day.

"I should like to know what?"

"Well, for one thing, sitting in the parlor with your Sunday clothes on, entertaining disagreeable people with sharp eyes, that look you over critically from head to foot and take an inventory of everything in their range of vision. If there is anything you particularly want to hide, they are sure to ferrit it out. You know, too, from the way they "dish up" their acquaintances to you, that they are preparing to serve you out in the same way when they leave. I know you would gladly plunge into the wash-tub to escape such an infliction."

"I guess Mrs. Trotter has been over to your house," said Rose, with a sly glance. "She was here last week to tea. I guess I would prefer washing;" and she set out a big tub under the shaded porch and filled it with clear water.

"Just see how beautifully that woodbine shadow is reflected in the water," said Maggie, looking down with real pleasure. "What a pretty picture it makes."

"If you can poetize over a washtub, you can over anything," said Rose.

"I like to pick up all the crumbs of happiness I can as I go along," said Maggie, "that is a part of my philosophy. "Beauty always gives me a thrill of pleasure, whenever I meet it, and you do find it sometimes in most unexpected places. Now just look for yourself, Rosy, at that picture which the sun has made on your mother's white counterpane on the line. Was there ever anything more perfectly drawn than those pear tree branches which are shadowed on it?"

"It is pretty," said Rose with some surprise. "I have seen clothes hung on that line all my life and never noticed the shadows before."

The two girls were soon bravely at work "in the thick of the fight."

"Let me pin back your sleeves, Rose, it is so provoking to have to stop every other minute and shove them up. It is just fun to have your arms in this nice, clean suds:" and she played with the foam a moment. It did not hinder her any.

"Speaking of disagreeable work," she continued, "washing is not half so dirty work as oil painting. I have tried both. Indeed, I think nice washing and ironing is quite among the fine arts, and the finished result adds ten times as much to the family good and comfort as the finest oil painting that ever was made. I always did love to sprinkle and fold down a basket of fresh, sweet, sun-dried clothes ready for ironing next day. The sight of them is a recompense for all the labor it cost. I am apt to cheer myself with this reflection as I go along."

"I think you are a philosopher, Maggie, but I think you try to cheat yourself a great deal and make work look pleasanter than it is."

"It is a very innocent kind of cheating, and makes me happier over my work, so I think there is no harm done. Just try it awhile and see how you like it."

"I guess it must be catching for I have got along with this washing with much less grumbling than common. To-morrow I would like to see what pleasure you can take in ironing and baking."

STATISTICS OF WOMAN'S LABOR.

THE Massachusetts report of statistics of labor, in many respects a valuable and interesting volume, makes one extraordinary mistake. In summing up the non-productive or dependent classes in Massachusetts, it counts up, together with 1787 persons "retired from business," 6,961 "infirm" and 505,905 children under fifteen years of age, the item extraordinary of 328,198 housewives. Apropos to this fiction, that the housekeepers are a "supported" class, comes the journal of one day's work by a farmer's wife, who believed in the seventeen-hour law, and who never struck for higher wages than her board and clothes. "Rose at 4.40, skimmed the milk, fed chickens, got breakfast ready at six. Dressed the baby, washed dishes, made the beds, killed the chickens, baked, ironed, got the dinner. After dinner went to the field and dropped corn till it was time to get tea. After tea "put away" the milk, washed the dishes, fed the chickens, sewed buttons on the husband's shirts, mended the stockings, watered the house plants, crimped the ruffles, in baby's Sunday frock, and left off at 9.30, having forgotten nothing that ought to have been done except patching the hole in the mitten."

MAN AND WOMAN.

Mrs. Roberts, in the Washington Capital, very truthfully remarks: Marrying a man to reform him is like being measured for an umbrella. It may or may not be satisfactory; but you might as well try to make a politician honest as to talk to a woman who loves a man. No matter how worthless he may be, she will brave everything, for him; and I would not give a snap for her if she did'nt. Not long since on the avenue I saw a man, respectable looking, in a helpless state of intoxication, a policeman on each side of him taking him to the station-house; behind him was his wife, a young, nice-looking, well-dressed woman. She paid no attention to the rabble following or the wondering looks of the passers-by, but stuck by him, trying to pacify and quiet him. I could not help thinking how little a man would stand by a woman. Man is of the "nobler" sex and a superior being; but he will get a woman in trouble, and then leave her to get out of it the best she can.

THE MOTHER'S LIFE.

THE mother's life is full of prose,
From early dawn till daylight's close,
But oft, amid her household cares,
Some little poem unawares
Is written down within her heart,
And of her life becomes a part.

Some loving words a child may say,
A golden curl long put away,
A half-worn shoe upon the floor,
An outgrown dress the baby wore,
A broken toy or faded flower,
May touch the heart-strings any hour.

THE British medical association have made consummate asses of themselves in a recent vote excluding women from their membership. Their old articles permitted the election by branches of "all duly qualified medical practitioners" recommended by a certain number of members, and under them Mrs. Garrett-Anderson and Mrs. Hoggan have been chosen. A by-law was presented by a Birmingham doctor, making "females" ineligible, and, to the shame of the English doctors, it was passed. The solo argument was that men, because of their sensitive modesty, were not disposed to discuss medical or surgical cases in the presence of women. Mrs. Anderson made a wholly unanswerable plea for the equality of women in medicine, on strictly scientific grounds, without a vestige of what might be called sentimental appeal on grounds of mere equality of rights; but the sexual prejudice was too strong. In a discussion of this matter locally, some time ago, we believe it was confessed by some of the doctors that they couldn't tell their customary stories if women were to be present at their meetings. Can this be the trouble in the great British association?—*Springfield Republican.*

THE fitness of having a woman-president for Vassar is more widely recognized than we had dared to hope. Before Vassar existed it would have been difficult to find so many believers in the capacity of women to hold professorships as now seem ready to concede that a woman may be found competent to a college presidency. The suggestion of Miss Anna C. Brackett receives, as as it deserves, the most deference, for she is by all odds the most distinguished of American women in the theory and practice of education. Good work as Vassar has done, we should expect from Miss Brackett's mind and methods an original and quickening impulse that would throw its past into the shade. Vassar needs a new inspiration.

L. M. B. of Elbridge, N. Y., wants to know how to arrange skeleton leaves into a wreath for framing. Will some RURAL reader please send the desired information to RURAL Office?

Domestic Economy.

CONDUCTED BY EMILY MAPLE

AFTER THE SUMMER—WHAT?

THE summer is over. September with its cool breath has warned the summer residents of every sea and river-side resort that it is "not always May," and the city once more resumes its wonted aspect. The months of picnic and bathing, of flirting and flowers, moonlight rambles and idle excursions, are among the past. The girls who have gained health and strength with the freckles and sunburn amid the mountain paths and in the valleys, are now saying to themselves and to each other—what?

True, there *are* many busy workers who return to their labor with renewed vigor, but ah me! what can the butterflies do? Will music or painting or any of the natural sciences become a winter's study? Is the proposed cooking school about to be established in Montreal likely to be patronized, till the art of cooking is perfectly learned, and its medal of honor proudly worn by our young ladies? Or will the winter months be spent in a round of calls, a worship of fashion, and the long, dull evenings be frittered away in inane and idle conversation that, too often, degenerates into gossip? Pity it is that so few people are interested in societies of art and literature in our cities, that the worship of Mammon or the struggle for position fills the thought and fires the ambition of the men of this age, while their wives, sisters or daughters are proud to remain at home helpless instead of helpmates, as they should be, with a scorn for labor of every kind that should be vouchsafed to nothing in this world but to sin or meanness.

After the summer—what?

ANNIE L. JACK.

TROUBLE WITH CUCUMBER PICKLES

FOR two or three years after I commenced housekeeping, I had a great deal of trouble with cucumber pickles. They would turn black or have black spots on them soon after they were put in vinegar, although they were as nice and bright as could be before. At first, I thought the fault must be in the vinegar, but I soon found that was a mistake; then, that it was because I freshened them in a pan that had some of the tin worn off, so I used a stone jar for that purpose, but the pickles did not improve. At last I found that the keg they were salted in had the hoops nailed on, and that the nails reached through to the inside, and believing this the first cause of the trouble, I bought a new half-barrel without a nail in it. Afterwards the pickles were all right till I was sick for several weeks when they were black again. By inquiring into the subject, I found that the girl had put a rusty tin lid over them while freshening, instead of the stone cover belonging to the jar, and I knew that as they had been warm some of the time, steam had risen to the lid and then fallen back on the pickles. Since then I have had no such trouble and have concluded that the brine or pickles must not come in contact with iron in any shape if we would not have them black. And yet I think that if health is to be taken into consideration, they might better be of that color than of the beautiful green which many make them with brass.

MRS. S. C.

DOMESTIC RECIPES.

Soda Cookies.

Three-fourths of a teacup of butter; two cupfuls of sugar; two eggs; a little grated nutmeg; one small teaspoonful of soda, dissolved in a tablespoonful of sweet milk; two teaspoonfuls of cream-of-tartar, in flour enough to make a soft dough. To make: Rub the butter and sugar together, until light; add the eggs, without beating, then the spice and soda. Beat a few minutes before putting in the flour; then handle as little as possible. Do not knead. Roll rather thin; cut into shape; bake in a hot oven. If liked soft, take the cookies from the tins as soon as baked, put in a jar, and cover closely.

Ginger Snaps (Excellent).

One teacupful of melted butter; one teacupful of brown sugar; one teacupful of dark molasses; one teaspoonful of ginger; one teaspoonful of soda in a large spoon of hot water. Flour, to make a stiff dough. Roll thin, cut into small cakes, and bake in a quick oven. Table sirup is not as good as common molasses, for ginger snaps. This recipe was taken from the RURAL NEW-YORKER, several years ago, and is the only one I ever use.

M. G. R.

Brown Bread.

Excellent bread can be made from coarse flour or "middling," and in our family it is relished much better than white bread for a change. Too much of it, however, should not be made at once, as it does not keep fresh long, and is very easily made. For three loaves, take as much hop yeast and water as for the same quantity of white bread, one spoonful of salt and enough coarse flour to make as stiff as pancakes. Set this at night and in the morning put in a cupful of sugar, a pint of white flour and nearly as much coarse flour as can be stirred in with a strong spoon. Put in deep pans or basins and, when light, bake. Graham bread is good, if made in the same way, but it is not necessary to put in the white flour.

MRS. S. C.

German Pickles.

Take sound, ripe cucumbers, peel and remove the seeds, cut lengthwise into strips an inch wide. To three quarts of the parts add three cups of vinegar and four of water; soak twenty-four hours, stirring once or twice. Put one quart of vinegar on the fire, add one pint of sugar, a little stick cinnamon and a teaspoonful of pimento tied in a bit of cloth; scald all together; add the cucumber and boil till soft.

Tomato Omlet.

Take three large tomatoes, peel and cut fine; stew till soft, adding salt and pepper to taste, a small piece of butter, and stir in three eggs just as you take it from the fire.

B. F. S.

News of the Week.

Monday, Sept. 23, 1878.

POLITICAL.

Its a good sign of the times that the Democratic Convention, held at Philadelphia, nominated four prominent republicans for judgeships. Last year the republicans voted solidly for a democratic judge, so that both parties recognize the fact that the judicial office should be filled by the most upright and competent men regardless of party affiliations. Out in Oregon J. H. Slater has been elected senator instead of Hipple-Mitchell, and is against inflation and in favor of a coin basis. Ex-senator Matt. Carpenter is receiving numerous petitions to become a candidate for United States Senator from Wisconsin, and, of course, "Barkis is willin'." Up in Vermont Judge Poland has formally offered himself as candidate for the seat in the senate, held at present by Senator Morrill. The struggle for the governorship of Massachusetts is this year attracting more general interest than any political movement at present taking place in any other State. There Butler's candidacy has, apparently, greatly disorganized the old parties, stimulated the activity of the Greenback-labor party, and caused great uncertainty as to the result of the present contest. On Tuesday last, the Democratic Convention for nominating a governor and other State officers met at Worcester. The State Committee had intimated that delegates instructed to nominate Butler would stand a slim chance of admission, as in nearly all such cases there were contesting delegations, and decisions would be rendered in favor of enough anti-Butlerites to secure a large majority in opposition to him. As stated here last week, Butler insisted that the Convention should decide the eligibility of its members.

The fear was that the Butlerites would not admitted to the floor of the convention, and to remove this danger, early on the morning a large body of them took possession of Mechanics' Hall in which the meeting was to be held, and proceeded to organize in their own favor. When their opponents learned of this move, they tried to have the forestallers ejected, or to hire another hall; but could do neither, as the mayor declared that an attempt to do the former would cause bloodshed, and all the other suitable halls in the city had been pre-engaged by Butler. Finally the Central Committee declared the convention adjourned till next Wednesday, when their adherents are to meet at Faneuil Hall in Boston. On their withdrawal, to the number of some 500 odd, there remained 973 delegates from 309 towns and cities, and these gave the nomination to Butler by acclamation. The bolters will name an anti-Butler ticket and thus divide the democratic party, many of whom will doubtless vote the republican ticket rather than see Butler triumphant. On the following day the republican convention met at the same place, presented a marked contrast to its turbulent predecessor, and nominated Thomas Talbot for governor. Butler has now at his back all the greenbackers, a large number of discontented republicans, and probably the majority of the democratic party, and has a fair chance of beating his highly respectable republican rival.

Gen. Beauregard was nominated for State treasurer by a coalition of republicans and greenbackers of Louisiana, but declines the nomination. Mr. Gotham, Secretary of the Senate and likewise of the congressional campaign committee, has been making a speech extolling the greenback doctrine. He thinks the republican party should favor it more, and intends to print and circulate as a campaign document a large number of Senator Thurman's late speech in favor of this movement.

In Connecticut the democrats, against the known opposition of Senators Eaton and Barnum, have adopted a platform in which they affirm gold and silver coin to be "the most stable basis for the commercial necessities of the world," but denounce the whole financial policy of the government which is slowly bringing us to that basis; they denounce especially the Resumption Act, but they leave all legislation upon it to the wisdom of Congress without a suggestion as to its character, and they condemn repudiation but declare that "whatever currency is issued should be for the benefit of the whole people." These resolutions were passed "as a whole" with neatness and despatch, neither Senator Eaton nor Senator Barnum being on hand to discuss or denounce them.

Secretary Sherman has been interviewed by a greenback editor, and the report, which Mr. Sherman is said to have revised, is sufficiently remarkable. He laid it down that it was a mistake to suppose that a man could not be a republican and a greenbacker at the same time; that the two positions are perfectly compatible; that the greenbackers have left the republican party simply because "his financial policy has been misrepresented;" but "the misrepresentations will be cleared up" and then they will come back to the old party. He considers a currency issued by government "superior and more economical" than national-bank notes, and the reason why he has been preparing to redeem the government notes is, that he found a law on the statute-book when he took office commanding him to do so. But when "resumption is an accomplished fact" and "the country has settled down to a specie standard," there being no longer any occasion for the national banks, "they will be legislated out of existence." He owns no bonds, and, so far from "working in the interest of the bondholders," he has been from the very first trying to cut down their interest. "He has been abused pretty generally, but having laid down for his guidance the interests of the whole country, he does not permit harsh criticisms to keep him from sleeping." There is one point in his estimable character as a politician and financier to which the Secretary modestly refrains from calling attention, and that is his eminently catholic and progressive spirit.

Sec'y Sherman has one good defence against any misrepresentation of "his policy" regarding silver, viz., the difficulty of knowing what it is. He has just issued an order rescinding the previous one directing the payment of silver for greenbacks. This makes the fifth order he has issued in attempting to be "friendly to silver" since July 19. The first directed certain banks to be furnished with silver dollars on their application; but they were to distribute it as currency, and not let importers have it for customs' duties. The second (Sept. 3) directed silver to be paid out in sums under $10,000 in exchange for silver certificates; but it was still to be used as currency, and the importers were not to have any of it. The third (Sept. 7) directed it to be issued at the sub-treasuries to anybody for greenbacks. The fourth (Sept. 13) forbade such payment, on account of doubt of its legality. The fifth (Sept. 14) directs silver to be furnished free of expense to 120 national banks, on their application, for general use, and directs United States' disbursing agents and paymasters to use silver dollars in their payments as far as possible, and Government employes who desire them in payment of their salaries, may also have them.

The trade-dollar imbroglio thickens. Letters continue to pour into the Treasury Department inquiring why they are not redeemed by the Government, why the bankers do not take them on deposit, and why, seeing that they contain more silver than the "buzzard dollar" (the designation applied by indignant holders of the trade-dollar to the new standard dollar), they are not universally current. The New York Central Railroad now refuses to take trade-dollars for tickets or freight, but they are still current in some departments of trade, so that their quotable price is considerably above their bullion value. Consequently there is money to be made by bringing them from California, or even from China, and putting them into circulation. It is estimated that about three millions are now afloat, and an agitation has been started in the West to have them redeemed at par by act of Congress. This would be equivalent to buying silver bullion on Government account at about 58*d.* per ounce, its market value being below 52*d.* per ounce. As the Government makes no profit on the issue of trade-dollars, but merely stamps them and certifies their weight and fineness, it would be a promising speculation to the holders of silver bullion to have a law passed for their redemption at par, and to have the mints kept open for the coinage of new ones.

MISCELLANEOUS.

The Rev. Dr. Samuel Caldwell has been elected as the new president of Vassar College. He was born at Newburyport, Mass., in 1820, graduated at Waterville, Me., College and at Newton Theological Seminary, and became a professor in the latter in 1873, after a pastorate of 27 years at Bangor, Me., and Providence, R. I. He belongs to the Baptist denomination.

Senator Davis of West Virginia has frequently charged that there was a deficiency of several millions in the Treasury accounts, but the experts he has had at work investigating them all summer, declare they can find no trace of such a deficiency. The Chinese of San Francisco have contributed $1,200 toward the relief of yellow fever sufferers.

Edison's latest invention will, according to him, replace gas in streets and houses by electric light, at a cost from 46 to 95 times less, according as the electric machine which generates the electricity producing the light, is run by steam or water power. The wires which convey the light are to be insulated and laid in the ground the same as gas pipes. The present gas burners can be utilized for the new light, and the same wires that bring this will also bring into every house power and heat. By means of the former, a sewing machine or any other mechanical contrivance that requires a motor, can be run, while the latter will cook food or serve nearly all the purposes of ordinary fires by means of suitable stoves. Edison says he has completed the invention and will give a public exhibition of it so soon as he has properly protected it by putting in claims for home and foreign patents.

FOREIGN.

The present Liberal government of Canada, under Premier Mackenzie has been heavily defeated at the elections just held, and a conservative house of representatives chosen under the leadership of Sir John McDonald. The issue upon which the electoral contest mainly depended was the promise of McDonald and his supporters, if elected, to enforce a system of thorough protection for home manufactures by the imposition of increased duties on all imports, and in retaliation for our heavy duties on Canadian goods, to levy prohibitory taxes on all importations from the United States. England, the great apostle of free trade, does not seem to have been successful in impressing her teachings on her Canadian offspring.

The debate in the Reichstag on the Anti-Socialist Bill began on Monday, and was opened by Herr Bebel in a manner sufficiently trying to the government, for he enlarged upon its relations with the socialists in former years when in need of an ally, and brought forward the evidence. He was replied to by Count Eulenburg, who had reason to know all the facts in the case and on that account was disabled from making an effective denial. This was reserved for Bismarck himself the next day, and his denial was emphatic and categorical, and included any connection whatsoever with Lassalle, the socialist leader. He denounced the socialists as a gang of bandits, for which he was in vain called to order by Bebel. The bill was finally referred to a committee of twenty-one.

A turn has taken place in the Afghan affairs favorable to England, and probably unfavorable to Russia, through the death of Shir Ali's younger son, Abdullah Jan, and the one whom he had selected as his heir, to the exclusion of his eldest, Yakub Khan, who had, through his military talents, won the throne for him in 1869, but whom his father has since kept shut up in close prison. Abdullah Jan was a youth of no character, and his death will probably lead to Yakub's release and reappearance on the scene. He is a very able man and a friend of the English. The Russian embassey has, however, it is said, reached Cabul, while the English mission is waiting at the frontier to hear from Shir Ali. The latest Russian story about the expedition to Balkh is, that it was ordered when war with England was thought likely, but has been countermanded since then; but this does not receive the credit its authors would like.

The United States Consul at Lyons has forwarded to the Department of State a report concerning the grain crops of the present season in the following departments: The Rhone, Isere, Haute-Loire, Haute-Alpes, Drome, Saone-et-Loire, Ain, Loire, Haute-Savoie and Ardeche, embracing an area of about 22,000 square miles and containing a population of over 4,000,000. The whole cereal crop only averages middling in the Rhone, Isere, Ain, Loire, Ardeche, Savoie, Haute-Alpes and Saone-et-Loire. Oats very good in the Rhone, Isere and Haute-Loire; good in the Hautes-Alpes, Drome, Loire, Saone-et-Loire, and fair in the Ain. Corn good in the Isere, Loire, Saone-et-Loire, and fair in the Drome and Haute-Loire. Rye good in the Hautes-Alpes, Loire, Haute-Savoie and the Rhone; fair in the Saone-et-Loire; passable in the Ain; middling in the Drome and Isere; and bad in the Savoie. Barley very good in the Isere, Haute-Loire, Haute-Alpes, Ardeche, Loire, Saone-et-Loire, Haute-Savoie and the Rhone; fair in the Ain, and middling in the Drome. During the year 1877 France exported 54,013,532 bushels of grain and flour, and imported 42,531,548 bushels, showing an excess of imports of more than 8,500,000 bushels.

An extraordinary and unlooked-for change has been made in the government of Egypt by the complete surrender to the state by the Khedive of his vast private landed property, amounting directly to 1,000,000 acres, or directly and indirectly to one-fifth of the soil, and all cultivated by forced labor, and largely acquired by outrageous oppression of individuals. Besides farming on a great scale, he manufactured on a scale still greater, owning numerous sugar, cotton, and tobacco factories. He began in 1863 with a debt of $20,000,000, but he has worked so well as a borrower that he now owes $535,000,000, and the population only amounts to 5,000,000. It is needless to say, too, that he has lost money in all his industrial enterprises; so that in surrendering his private property, and appointing a Constitutional Ministry, with Nubar Pasha at the head of it, and Mr. Rivers Wilson the English financier, as Minister of Finance, he is virtually going into bankruptcy. In the language of our time, having suffered enormously from "shrinkage," he has "gone into liquidation." He accompanied his surrender with a little speech in which he said that Egypt was to be African no longer; it was hereafter to be administered as a European state.

Italy has established a quarantine against the whole United States. An unusually high rise is taking place in the Nile and a disastrous inundation is apprehended. In Spain a conspiracy to establish a federal republic has been discovered at Seville. Recent elections there for Provincial Councils, however, give a large government majority, 200 adherents of it having been elected against 60 belonging to the opposition.

The Russian troops in front of Constantinople, which it is now ascertained mustered full 80,000, have begun to retire. Half have already embarked, and the remainder are to withdraw into Eastern Rumelia, which they are to occupy for some months, while the government of the province is being organized. In the meantime the negotiations between Sir Austin Layard and the Porte about the reforms in Asia have been going on swimmingly, but have a comic side. The Porte has been found not only ready but eager for reform, and the reforms suggested by the British Minister are luckily the very ones the Turks were themselves thinking of, namely, police, decent roads, and tolerable courts of justice, or, in other words, a fair amount of protection for life and property. These little changes will, however, they say, cost $30,000,000 merely to begin, and they propose that England should advance this sum on the surplus of the Cyprus revenues. This seems to have been too much even for the English minister, and he returned a peremptory refusal. There is probably now no one left who would entrust the Turks with any sum, however

small, for the purposes of "reform," and it remains to be seen how the difficulty will be got over. No progress has been made in the settlement of the Greek question. Germany and France are disposed to interfere, but England is opposed. HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 21, 1878.

BEANS AND PEAS.—Old mediums and marrows are steady, supplies of new forming no competing feature. A few of 78's crop sell in a struggling way at $1 60 for mediums and $1 60@1 70 for marrows. New red kidneys are weaker and likely to decline as recent pressing orders have been filled. New black beans open where they left off at $2.50. Beans are curing slowly and many will have to be hand-picked to make them suitable for shipment. Canadian peas uncertain in price, but the stock is light, quoted 78@80c.; green peas, new, steady at $1 35. Southern B. E. peas firmer, receipts not liberal, $1@4.25 per 2 bush. bag. Medium beans, old, prime $1.50@1.55; fair to good, $1 40@1 45. Marrow, prime, free on board, $1 50@1 52½; fair to good, $1 40@1 45. The remnant of pea and white kidney, $1 40@1 60.

Receipts of beans, for week, 2,528 bush. Exports, 730 bbls.

BUTTER.—A strong feeling prevails in the high grades of butter, both State and western. Trade is moderate and light supplies of desirable quality is the only mainstay of prices. Export trade is of little account, and buyers have to be humored. The weather has been as bad, if not worse, than the hottest part of summer, for handling stock. Many lines and lots have tired out under the merits they would have held had the weather been favorably cool. There is a better offering of Welsh, but more could be placed. State dairy tubs average poor in quality, and 16@18c. have been regarded as good figures, for sound useful stock. Summer made western is running poor; worse than the same grade of State. Perfect western dairies sell readily at the extreme. Receipts for week 29,553 pkgs.; export, 12,853 do.

State dairy, pails, choice, 21@22c.; other, 16@18c.; half tubs and pails, choice, 20@21c.; other, 16@18c.; Welsh tubs, choice, 20@21c.; other, 14@18c.; poor State, 11@13c.; creamery, best, 24@25c.; good, 20@22c.; sweet cream, 21@22c.; Western creamery, best, 23@24c.; other, 16@21c.; Western dairy, selected, 15@16c.; fair to good, 10@13c.; factory, best, 12@13c.; fair to good, 8@9c.; very poor, 6½@7c.; grease, 4@5½c.; single dairies, firkins, State, 18@20c.

COTTON.—Shippers have been buying sparingly, the foreign advices tame, and with a freer movement forward of the new crop, prices have declined. Latest prices are: for September, 11.13@11.11c.; October, 10.95c.; November, 10.79@10.80c.; December, 10.76@10.77c. January, 10.79@10.80c.; February, 10 88c.; March, 10.94@10.95c.; April, 11.03@11.04c.; May, 11.10@11.11c.; June, 11.15@11.17c.; July, 11.21@11.23.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9¼	9¼	9⅜	9⅜
Strict ordinary	10 15-16	9 15-16	10 1-16	10 1-16
Good ordinary	10 7-16	10 7-16	10 9-16	10 9-16
Strict good do	10⅜	10⅜	11	11
Low middling	11⅜	11⅜	11¼	11¼
Strict low middling	11⅜	11⅜	11⅜	11⅜
Middling	11⅜	11⅜	11⅝	11⅝
Good middling	11⅜	11⅜	11⅜	11⅜
Strict good middling	11⅜	11⅜	12	12
Middling fair	12⅜	12⅜	13⅛	12⅝
Fair	13	13	13⅜	13⅜

Stained.

Good ordinary....9⅝; Strict good ordinary....10⅛
Low middling....10⅝; Middling....11⅛

CHEESE.—The exports for the week have been 42,000 boxes; the receipts have only slightly exceeded these figures, but it must be remembered that supplies have previously, for two or three weeks, been steadily accumulating, and that there are excessive amounts of certain grades in store. The only class of stock that has sold well this week has been the choicest of the late made; these have ranged at 8¾@9, and the offerings have been pretty well absorbed; parcels that have shown early make have dragged, and of these and good grades generally the assortments are chiefly.

Quotations are: Fancy at 8¼@9c.; 7@8c. for good and prime; 6@7c. for fair to good; 5@6½c. for half skimmed; 3@4c. for skimmed. State, farm dairy at 7½@8c. for good to choice, 6@7c. for fair to good, and 3@4½c. for poor skimmed. Wisconsin factory, fine to fancy, 8¼@8½c.; do. good to prime, 6¾@7½c.; do. fair, to good, 5½@6¾c.; Western factory fine, full cream, cheddar, 8@8¼c.; do. fine, full cream, flat, 8@8½c.; do. good to prime, flat, 6½@7c.; do. half skimmed, 5@6c.; do. full skimmed, 3@4½c.

Receipts for week, 51,052 boxes.
Exports for week, 41,790 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 42s., which is lower.

DRIED FRUITS.—New Apples show freer assortments; the business in them is slack, and confined to choice sliced; prices are unsettled and easy. Peeled Peaches have not varied in price, with fair supplies, however. Blackberries are easy. Cherries are steadily held.

New blackberries, quoted at 5½c. Peaches—Peeled, new Georgia, 6c. for poor, 7½@8c. for fair to good, and 8½@9c. for prime; choice North Carolina 11½@12½c.; good do., 9@10c.; unpeeled new halves, 5½@6c.; quarters, 3½@3½c. Pitted cherries, 15@16c.; southern plums, new, 10@11c. Apples—Old State quarters, 3@5½c.; do., sliced prime, 4½c.; do., good, 3½@4c. New apples 3@4c. for southern quarters in bbls.; 4½@5c. for prime sliced, and 6@7c. for fancy. New raspberries, 24@25c., and evaporated, 2@25c.

Exports past week 207 bbls. dried apples.

EGGS.—Receipts for the week 5,461 bbls.; do. last week, 5,750 do. Western and Canadian have been ½@1c. higher during the week than we quote, but dealers do not look for a further material decline, while supplies arrive at the present rate: near points, 20@21c.; State and Penn., 20c.; Canadian fresh 19c.; Western do, 18@18½c.

FRESH FRUITS.—The Peach trade now depends upon N. J. and up-river orchards for supplies. The latter are furnishing very elegant stock which is complimented by remunerative rates. Up-river fancy baskets $3@4; good, $2@2.50; N. J. Extra, $2.50@3; fair to good, $1.50@2; common, $1. Apples have ruled extremely low with very prime qualities offering. A few fancy Western have touched $1.50; sales mainly 50c.@$1.25 for double heads, 50@75c. for open do. Pears are improving. Bartletts nearly gone. Boston bushel boxes $1@1.50; extra bbls. $12@15; other $3@10.; ice-house lots not coming out satisfactorily; too ripe when housed. Other items of pears quoted as follows: Seckel, choice, $7@9; common, $4@5; B. Clairgeau, Sheldon and Buerre d' Anjou $5@6; B. Bell, Duchesse, Swan's Orange $4@4.50; Cooking $2@3. Quinces are showing nominally $5 ₱ bbl. Plums run up so high that buying was checked Copper, bbl., $10@11; Reine Claude, $12@14; Damsons, $6@7. Grapes have a steady demand; State catawba, 8@9c. ₱; Delawares, 7@10c.; up-river concords, 3@5c.; N. J., 2@3c.; Cal. Tokay, in order, $6 crate of 40 lbs.; muscat, $4; hot-house, 20@40c. ₱. Peanuts have an improved tone without enlarged business: Hand-picked Va., $1.45@1.50; fancy, $1.30; other, $1.20@1.25. The Producers' Price Current says: "The Wisconsin crop has been frost-damaged to the extent of one-quarter to one-half the crop; while prolonged warm weather has produced serious rot-ravages in the N. J. crop." Watermelons, selected, $20@25 ₱ 100; good, $12@16. cuts, $3@8; nutmegs, 50c.@$1.75.

Exports of apples past week, 2,178 bbls.

FLOUR.—Large supplies and easy prices for wheat have exerted a pressure to sell, more especially the winter wheats, prices for which are a trifle lower.

Latest prices are $3.30@4.00 for very inferior to fancy superfine State; $3.40@4.15 for common to good extra do. odd lots and lines; $4.15@4.45 for good to choice do., strictly choice and fancy lots above this; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c.; $3.90@4.15 for inferior to good shipping extra do. and $4.15@4.40 for good to choice extra do.; common to about choice white wheat extras, $4.15@5.25; choice to about fancy do. at $5.30@6.25; red and amber winter wheat, inferior to choice trade and family at $4.00@5.50; round hoop Ohio at $3.90@$4.25, and trade and family brands of do. at $4.25@$5.50, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.10@4.90 for very poor to good extra, and $4.90@6.25 for good to very fancy; Minnesota clear, very inferior to very choice at $4.15@5.00 (fancy brands at higher prices); Minnesota "straight," inferior to very fancy at $5.@7.50 (few brands of even fancy going above $7), and patent fair to strictly fancy at $6.25@8.75; unsound stock at from $2.00@5.00; city mill extra at $5 00@5.25 for West Indies (the latter rate for fancy in new packages); do. for England, 4.90@$4.10; do. trade and family extras, $5.30@5.50; do. for South America, $5.30@5.20 for fair to fancy; No. 2 at $3.40@3.40 for inferior to very fancy, the latter an extreme.

CORN MEAL.—Sales at $2.90@2.95 for Brandywine and $2.40@$2.65 for yellow Western.

GRAIN.—Wheat has been in very large receipt, but the continent demand for the winter grades is unprecedentedly large and the English markets are also buying freely. As an instance of this movement, there have been taken in this market, within a fortnight, something over 5,000,000 bushels, all of which goes to the other side.

Latest sales are of ungraded white at $1.05@1.14½; new No. 2 Chicago spring $1.01½; No. 3 spring at 96@97½c.; ungraded amber at $1.01@1.08; No. 2 amber at $1.05@1.05½; do. steamer grade at $1.04@1.01½; ungraded red at 96c.@$1.07½; No. 1 red at $1.07½; No. 3 red at $1.00½@1.04; do. steamer grade at $1.02@1.03; No. 2 red at $1.06½@1.07; do. steamer grade at $1.04½@1.05½; white State at $1.12@1.14½; No. 1 white at $1.12@1.13; do. steamer grade at $1.11@1.12; No. 2 white at $1.11@1.11½; do. steamer grade at $1.08½@1.09½; No. 3 white at $1.06@1.06½; New York No. 2 spring, September option, at $1.01¾; do. October option, at $1.01½; No. 2 amber, September option, at $1.05½; do. delivery Sept. 25 to Oct. 15, at $1.05½; do. October at $1.06½; do. November, reported at $1.0 : No. 3 red, September option, at 1.06¾; do. Sept. 25 to Oct. 15, at $1.07; do. October option, at $1.0⅞@1.06¾; do. November option, at $1.08; No. 1 white, Oct. 1 to 10th, at $1.13¾; do. first half Oct., $1 13½; do. Oct. 1 to 20th, at $1.13½; do last half Oct., at $1.13@1.13½; do. Oct. option, at $1.13. No. 1 red, Oct. 1 to 20th, at $1.07¾. Rye is active for export; sales at 60¼c. for Western and 63@64c. for State. Corn is plenty and rather slow, with prices easy; latest sales are of New York No. 2, Sept option, at 50¾@50½c.; do. Oct. option, at 50¾@51c; do Nov. option, at 51¾@52c.; steamer mixed, Sept. option, at 49¾c; do. Oct. option, at 50¾@50½c.; do. Nov. option, 51¾@51½c. Spot lots included New York No. 2 at 50¼c.; steamer mixed at 49½@50c, chiefly at 49¾@50c, and ungraded mixed at 47½@50¼c. Oats are active and higher; sales of New York No. 1 at 32@33¼c.; New York No. 2 at 30c.; New York No. 3 at 26½c.; New York rejected at 25½c.; New York No. 1 white at 37c.; New York No. 2 do. at 30½c.; New York No. 3 do. at 28¾c. No. 2 Chicago quoted at 32@32½c.; white Western at 28@37½c.; mixed do at 26@35c.; white State at 29@39c.; mixed do. at 28@34½c.

HAY AND STRAW.—Common grades of hay are in excessive supply; prime lots are wanted and rule as before.

Sales at 45@50c. for shipping and 65@80c. for retail qualities. Straw quoted at 35@45c. for long rye; 25@30c. for short rye.

Exports past week, 833 bales.

HOPS.—Prices have eased off and closed unsettled. Export trade is still in obeyance, and brewers buy sparingly. Receipts for the week have been about 700 bales, while only about 90 bales have been shipped.

Emmet Wells says, in his circular, "The American crop is now secured. The yield, in our opinion, is 150,000 bales, which is 60 per cent. below that of last year. The yield last year was 250,000 bales, disposed as follows:

	Bales.
Shipped to foreign ports	100,000
Used at home	110,000
In hands of brewers	30,000
In hands of dealers and growers	10,000
Total	250,000

If our consumption is the same this year as last, we shall have a surplus of 40,000 bales; but it is not likely we ship as many as 40,000 bales unless foreigners will take in a few rusty and moldy hops. The proportion of choice hops will be very small, probably not over an eighth of the crop; or, say 18,000 to 20,000 bales. The price to-day in this market is 10 to 15 cents; a very choice hop, if here, might bring a little more money."

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 10@12; New Yorks, new crop, poor, 9@10; Eastern, new crop, none; Wisconsin, new crop, none; Yearlings, growth 1877 (nominal) 5 to 8; Pacific coast hops, growth 1877, 5 to 10.

LEATHER.—Sales at 19½@20c. for light; 20@21½c. for middle; 20@22½c. for heavy, and 18@19c. for good damaged.

OIL-CAKE—Western is offered at $31 per ton, being in larger supply.

PROVISIONS.—Export demand has been better, and prices have been steadier. Mess pork quoted at $9 25@9 37½ for spot lots; $9 10@9 15 for October; and $9 20 for November delivery. Bacon at 6¼c. for long clear and 6½ for short clear. Lard, western steam, at $7 02½ for spot lots; and $6 95 for October and November delivery. Stearine at 7¾ for western. Tallow at 7 1-16c. for prime. Beef hams at $17.50@18. Beef—extra mess, $10 50@11; plain mess, $10@10.50; packet, $11@12 for bbls.; extra India mess, $19@21 for city brands; do., Philadelphia, $18@19.

POULTRY AND GAME.—A moderate supply of live has kept prices firm. The Jewish holidays of next week are expected to give activity to trade.

Chickens, N. J., 13@14c. lb.; State and Penn., 12@13c.; Southern and Western, 11@12c. Fowls—N. J., 12½@13c.; State and Penn., 11½@12c.; Western, 11@11½c.; Southern, 10@11c. Roosters, 5@6c. Prime turkeys, 13@14c.; poor to fair, 11@12c. Ducks, ₱ pair, $1@1.13; poor to good, 40@80c. Geese, N. J., $1.25@1.75; W. & S., $ 1.00@1.25.

Dressed poultry includes more scalded stock, but it anticipates the demand as the weather is warm and risky for remote shipped parcels.

Turkeys, dry picked, 15@17c.; other, 13@16c. Pa. chickens, 17@18c.; N. J., 15@16c.; State, 15@16c.; Western, 14@15c. Dry pricked fowls, 14@15c.; N. J., 13@14c.; State, 12@13c.; other, 10@11c. Phila. ducks, 18@19c.; State, 12@14c.; Western, 10@12c.

The game market is higher; demand fair, with a good list of items.

Grouse, trapped, pair, $1@1.12; Partridges, $1@$.25; Woodcock, $1@1,12; stall-fed pigeons, doz., $1.75@2; Hight, $1.12@1.25. Wild ducks, Mallard, 65@75c. pair; Teal, 50@60c.; common, 30@40c. Tame squab, $2@2.25 doz.

SEEDS.—Timothy is plenty and much lower, quoted at $1.20 for prime. Flaxseed holds to $1.52½@.

TOBACCO.—The supplies continue liberal, but the outlet for supplies is fair and prices rule very regular. On most grades quotations are for Western Leaf.

VEGETABLES.—Exports of potatoes, past week 7,118 bbl.; of Onions, 382 do. Potatoes are firm, but not quite so high as early in the week. Stock includes Nova Scotia and Maine. E. Rose prime $3@2 25 per bbl.; poor to good do., $1 25@1 75; Peerless, $1 75@1 87, choice, and $1.50 for fair, all bulk rates; Sweet, potatoes low, $1 50@1 75. Va. and Md. Other items not specially changed. Sweet Corn, 100, 50@75c.; Lima beans, in good bag, $@1 75c.; shelled, $2 50@2 75; String Beans, 50c.; Cucumber pickles, 1,000, $1 50@2; Tomatoes, bushel, 20@35c.; Onions, red and white Eastern, $1@1 25; Chester, red, 75c.@1 12; Marrow Squash, $1 50@2, bbl.; Bullnose Peppers, bbl., 75c.@$1 25; Beets, 75c.; Cabbages, 100, $2 50@5; Egg Plants, 100, $1@2.; R. turnips, $2.; Carrots, $1 25.

WOOL.—Supplies are full, but manufacturers buy very sparingly, and prices are sustained with difficulty: the medium grades have most demand.

Quotations are—Ohio, Pennsylvania and West Virginia—XXX and picklock, 40@42c.; XX, 36@38; X, 35@37; No. 1, 30@33c.; No. 2, 32@35c; coarse, 30@32c. combing, 40@45c.

Georgia, Alabama, Mississippi and Louisiana—Fine unwashed, 27@30c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@16c.

LIVE STOCK MARKETS.

Saturday, Sept. 21, 1878.

BEEVES.—Receipts for the week, 11,805 head; do. last week, 11,836 do. The trade has been a sluggish one throughout the week. Detained stock, which made receipts uncertain, and the apathy of butchers, owing to hot, business-depressing weather, rendered prices weak. The offerings were of mixed quality; the few best droves were from Kentucky. The latter brought 10¼c., to dress 57 lbs. The range for natives was 7¾@10¼c., the lower rate for cattle to dress 55 lbs. Texas and Cherokee, to dress 55 lbs., 7¼@8c. Grass-fed bulls, $2.45@2.50 ₱ 100; fair to good native steers, 8¾@9¼c., to dress 56 lbs. The highest rate, 10¼c., was paid by exporters.

COWS AND CALVES.—The offering was quite large for the season; old ranges realized.

VEAL CALVES.—The demand is good and choice calves are higher. Common to choice at 6@7¼c.; grassers, 3@3¾c.; buttermilk, 4@4¼c.

SHEEP AND LAMBS.—Receipts for the week, 30,864 head; do. last week, 28,705 do. Trade is dull at the close; the extreme range is 3¾@5¼c. for sheep and 4¾@5¾c. for lambs. Exporters have paid 5¾@5¾c. for choice sheep

SWINE.—Receipts for the week, 18,024 head; do. last week, 20,793 do. The market for live hogs was steady at $4.40@4.70 for good to prime corn-fed; extra heavy rejected or taken at low figures. Choice dressed N. J. brought 7c. The weather has damaged much of toe late supply.

HELP!

FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S

ELECTRIC BELTS AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years.

Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

PULVERMACHER GALVANIC CO.,
Cor. Eighth and Vine Sts., CINCINNATI, O.

☞ *Avoid bogus appliances claiming electric qualities. Our Pamphlet explains how to distinguish the genuine from the spurious.*

Reading for the Young.

POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 18.

APPENDED is a letter from a RURAL Cousin who coms to feel that the case of those situated as he is, has been overlooked by writers in this department,—but wo will let him tell his own story:

WASHINGTON, Sept. 12, 1878.

DEAR UNCLE TRUE:—I have been reading all the articles in your paper telling what young people can do to get a little spending money for themselves, but they don't seem to fit my case exactly, but are for those who live near large towns or cities where folks have plenty of money to spend, and it is easy to get at them to sell things. I live in the country thirty-six miles from any railroad, and there is no town with more than a thousand people within a good ways, and there are lots of boys all over the West who are no better off than I am. We don't need a great deal of spending money, but what little we do want is mighty hard to get, and if you can just tell how you think it can be done, there are enough to give it a trial, you bet!

RALPH WILKINSON.

We wish Ralph were sitting in this chair beside us where we could have a good talk with him, for we have an idea he is just the style of boy we like. We have printed the letter just as it was written that we might call his attention to its two extremes—the beginning and the end. There are twenty-eight post-offices in the United States named Washington. How are we to know at which one he resides? He will probably never write another letter without giving the name of his State, we will warrant. We would also suggest that the use of slang words and phrases is not commendable in conversation even. They are apt to slip away from a wide-awake boy sometimes without his knowing it, but when he writes them we are obliged to think he does it on purpose.

If Ralph were here we should say to him, "The best advice we can give you, and all others like you, is to *think*." Those men have made the greatest successes who have thought for themselves and not gone on doing as others have done before them. Ask yourself "What can I do that has not been done by anybody else? What is needed by the people about me?" If you can originate something it will pay you more than you will need for pocket-money. In the meantime we will give you a hint or two.

Send a letter addressed "Smithsonian Institute, Washington, D. C.," asking for a pamphlet containing directions for preserving birds and animals. It will be sent without cost. The process is easy to learn, and a little experience will enable you to do it nicely. Do you think you would have any difficulty in selling a hundred quails, squirrels, prairie chickens or any other variety of birds or animals to your acquaintances, if they were nicely prepared? We think not. And if you become proficient as a taxidermist you would doubtless find sale for your preparations in towns more than thirty-six miles away.

We are very glad this question was asked, and, while we give only this one suggestion now, the subject shall not be forgotten or neglected.

We omitted to say that taxidermy is a work in which girls as well as boys can engage, and with equal promise of good results. While Ralph is awaiting his directions from Washington, getting the practice necessary for doing good work, he might canvass for subscribers for the RURAL. We have no doubt he could get quite a club by a little exertion. This is just the time to do it. The evenings are getting longer and people in the country will want something to read, and what can be better than the RURAL? This may not be an original idea, but it is nevertheless true that hundreds of country boys and girls could in this way easily fill their purses with pocket-money.

A TALE OF MANY TAILS.

BY KATHARINE B. FOOTE.

CARRY stood in the door-way with her dolly on one arm and her kitten hanging over the other. Kitty didn't look comfortable, but she bore up bravely, only once in a while giving a plaintive mow. Carry gazed into the bright white sunshine.

"It's melting hot," she said. "I guess, grandma, I'll take my doll and Friskarina out to the wash-house and have a party."

"Well," said grandma, looking over her spectacles, "I've no objection; only there's a black cloud coming up, and you may get caught out there in a thunder storm."

"If I do, can Jake come for me with an umbrella, and can I take off my shoes and stockings and come home barefoot?"

"Yes; I don't believe it would hurt you."

"Then I'll go;" and Carry picked up a box with a little tea-set in it, and started off saying; "Do you believe it'll rain cats and dogs and pitchforks, grandma? That's what Jake says."

"No, my dear. You'd better ask him if he ever saw such a rain."

"So I will," and away went Carry through the sunshine. And she said to herself: "Wouldn't it be funny if it did rain so? I guess grandma wouldn't like it much if cats rained down, 'cause she says five cats are too many now."

The tea-party on an old chair without a back wasn't much of an affair after all; for, although the doll—Miss Rose de Lorme—was propped up against a starch-box more than half a dozen times, she would keep on sliding feet first until she came down flat on her back and thumped her head.

The kitten went to sleep in the corner just as soon as Carry put her down.

"Oh, dear!" sighed the little girl. "It's so lonely with cats and dolls and things that can't talk!" And then she sat down in a corner by the old wash-boiler, where she could see out of the open door, and took Kitty into her lap.

The great fluffy clouds banked up higher and higher, and from being white and dazzling they began to grow black at the edges; and the black masses rolled up and up, until the sun was all hidden and the sky was dark. Then came the rain, gently at first, in drops far apart, but soon it fell faster and faster, and the little leaves on the currant-bushes jumped up and down and seemed to enjoy the shower-bath. To Carry's great delight, little streams began to creep over the path, now in separate little trickles, and and presently with sudden little darts into one another, as they came to uneven places in the walk. She watched it all with great wide eyes, and felt quiet and cool just to smell the damp earth.

But soon the drops grew bigger, and all at once they were n't drops of rain at all!

"Good gracious!" cried Carry. "Kittens,—little blind kittens! It'll rain dogs next, I suppose!"

That's exactly what did happen; for down came puppies along with the kittens. They squirmed and mewed and hissed and yelped, and all the time kept growing bigger and bigger. Some came head first pawing and mewing the air as they fell; some tail first, looking scared to death; but most miserable of all were those that came down tumbling over and over.

It made them so dizzy to come down in that whirligig fashion, that they staggered about when they tried to stand. Carry felt truly sorry for them, and yet she couldn't help laughing. And the cats and dogs who had come first laughed too.

"Dear me! That's sort of funny, is n't it?" she thought; but the surprise did n't last long, for, in the midst of a tremendous shower, down came two most remarkable figures, and, with them, what at first sight appeared to be several long sticks; but, on looking again, Carry saw these were pitchforks!

"Oh!" said she, "I thought they'd come."

Then she stared for a minute at the two odd figures, and cried: "Why! it's Mother Hubbard's dog and Puss in Boots!" And sure enough, so it was!

Puss had a blue velvet cloak on his shoulders, large boots, and a velvet cap with a long plume. He turned toward Carry and made her a low bow, gracefully doffing his hat.

"You are right, Mademoiselle," said he. "I am that renowned personage, and your humble servant. Permit me to add, Mademoiselle, that my eyes have not beheld a fairer damsel than they now rest upon, since last I saw my beloved mistress, the charming Marquise de Carabas."

Mother Hubbard's dog was dressed in a suit of fine old-fashioned clothes, and held tightly between his teeth a very short-stemmed pipe from which he puffed great clouds of smoke.

He came up beside puss, and said, without removing his pipe: "Stuff and nonsense! We don't talk so stupidly in our village. Don't waste your time in silly yarns, but let's settle this fight at once."

Puss turned away and, addressing Carry, said: "Mademoiselle, this plebeian does not understand the language of court circles, to which I have been used for many years. Mademoiselle will pardon his ignorance." And here Puss rolled up his eyes and placed his hand upon his heart and bowed so low that he was actually standing on his head before he had finished. But he turned a graceful somersault and came right side up again in half a second, without looking at all disturbed.

"Sir!" said the dog, with dignity, "this matter should be settled at once, or the sun will be out, and then——" he stopped short and winked at Puss in a very knowing manner.

"Ah! that is true," replied the cat, "I had forgotten. Shall it be a general or a single combat?"

"Well," said the dog, gravely, sitting down on a large flower-pot near by, "I think, as we have been wanting to fight this out for some time,—indeed, I may say, almost since time began,—we had better allow every one to have a tooth and a claw in it. Then, perhaps, this matter will be settled forever."

"Quite my opinion," responded Puss. "But first the ladies, infants, and weak and wounded, must be removed from the field."

"All right!" said the dog. "But look here. You first stop that, will you?" and he pointed to a fine gray cat that was rubbing herself against a large, comfortable-looking Newfoundland.

"Immediately," said Puss, and he bawled in a loud voice, "There is to be no friendly intercourse between soldiers of the two armies. It is in the highest degree detrimental to military discipline."

And the dog shouted, "Stop being pleasant to each other, right off. I can't have it. You always have fought, and you've got to fight now."

The big Newfoundland at once made a snap at the gray cat, and she put up her back, spit and clawed at him, and ran off as fast as she could.

Then Puss waved his handkerchief, as a flag of truce, and said in a loud voice, "There will be a cessation of hostilities for five minutes, until the non-combatants are removed."

The able-bodied cats arranged themselves in rows, and the dogs did the same. The two generals stepped grandly in front of the lines, and the battle seemed about to begin, when a young and frisky cat, at the far end of the front rank, took advantage of a dog opposite who had turned his head, and jumped upon his back, clawing him in so cruel a way that he howled dreadfully.

At this Mother Hubbard's dog advanced angrily, and taking the cat by the nape of the neck, threw her among the cat army, saying: "The trumpet hasn't sounded, and we haven't begun yet. That was a real sneaky trick, just like a cat."

"Sir!" cried Puss in Boots, loftily, "Do you mean to insinuate that I am a sneak?"

"I didn't say so, precisely," returned the dog. "But if you want me to, I will." Then he added, in a taunting tone, "you are a sneak!"

Puss trembled with rage at this insult, and drew the little sword he wore at his side.

"Prove it!" he cried, brandishing his blade.

"Didn't you sneak yourself and your master into a castle and fine clothes that you had no right to?"

"Didn't you pretend to be dead once and frighten your poor mistress nearly out of her wits? Take *that*, sir!" and he made a furious cut at him.

But the dog dodged the weapon, and, with a cutlass suddenly pulled from behind him, made a fierce blow at the cat. Puss leaped nimbly away, with a scream of triumph and defiance. Then they set to with all their skill and hate and cunning.

Presently Puss fell, apparently dead, and Sir John Hubbard, the victor, was leaning on his cutlass, looking sorry, when suddenly Puss jumped up, grasped his sword and made a savage lunge at the dog. "That was only one of *my* lives!" he screamed. "I have eight left. Cats have nine lives, but you — you miserable dog — have only one."

Then they fought worse than ever, and neither seemed willing to yield.

But the fight ended in a strange way. Just as the dog again laid Puss low, a tremendous shower of pitchforks fell, beating on everything with dreadful effect. Sir John saved himself by getting under a tree, but poor Puss couldn't move to a shelter, and his remaining seven lives were being rapidly knocked out of him. when the brave dog rushed out into the storm and proved himself a generous foe by shielding Puss from the pitchforks with his own body.

"You are a dear good dog!" cried Carry. "I always loved you the best!" But even as she was speaking there came a terrific clap of thunder, and her own cat, who had been trembling with fear, sprang to her shoulder and buried her claws there, and as Carry shrieked with fright and pain, Jake was holding her in his arms.

"Were you frightened, out here all alone?" said he. "I was busy and I didn't think you'd mind the rain; but when the thunder began I came out quick."

"Rain?" said Carry. "I don't mind rain, Jake; but I don't like it to rain cats and dogs when they fight. Why, where are they?" She lifted her face from Jake's shoulder, and looked about her amazed, for not a cat was to be seen nor a dog, but only the steady rain, pouring straight down.

"Cats and dogs!" said Jake, laughing.

"And pitchforks, too, Jake,—yes, really!"

"Well," said Jake; "if you aint the most *curious* little gal!"—*St. Nicholas.*

ANSWERS TO QUESTIONS IN RURAL, SEPT. 7.

No. 1. Put cold, wet cloths upon the throat and chest, and cover warmly with flannel; change often; keep on until inflammation subsides.

No. 2. As soon as possible after accidents, get a bandage one yard or more in length, and half as wide; wet in cold water, then roll smoothly and tightly around injured part; give complete rest and constantly damp with cold water.

No. 3. Apply spirits ammonia, or common whiting, moistened with water, and relief will soon follow.

No. 4. Raise both arms above the head, holding them there a few minutes; or sponge head and face with ice water, and place a towel wet in cold water, between shoulders.

No. 5. Emetics of ipecac, mustard seed, whites of eggs, oil and lime-water or flax seed tea.

No. 6. Pour a pint of boiling water on a handful of sage leaves; let it stand a half-hour to cool; add vinegar to make it acid, and honey to sweeten to taste. Gargle throat often.

No. 7. Insert the finger in a whole lemon; wear thus twenty-four hours, and it will be cured without further trouble.

No. 8. Pour milk over the burned part, then sprinkle flour over; let it remain until cured. Or, take one drachm alum, whites of two eggs, one teacupful lard: mix and spread on a cloth and apply twice a day.

No. 9. First stop the bleeding by bringing edges of the cut together, and holding with the finger till a tight ligature is arranged above the cut. If the blood still flows, tighten the bandage. If no surgeon can be procured, wash the wound in warm water, take a silk thread and a pair of pincers, have the bandage slightly loosened and you can then see the mouth of the artery. Seize at once, draw it out a little while an assistant ties it with a double knot. In this manner take up all the several arteries you can see.

No. 10. Drop some warm glycerine into the ear by means of a quill, then introduce a piece of wool.

No. 11. Rub the body dry, then roll in warm blankets and put in a warm bed, in a warm room. Apply warm water to arm-pits, thighs, and soles of the feet.

To restore breathing, lay the body face downwards; place one arm under forehead. If there be no breathing, turn the patient on the side and excite the nostrils with snuff or ammonia, and tickle the throat with a feather.

Rub face and chest well and dash cold and warm water alternately on them. If there is still no success, imitate breathing by laying the body first on the chest, and then on the side, as by laying it on the chest the weight of the body forces the air from the lungs, while fresh rushes in, as the body is placed on the side. When the patient is able to swallow, give small quantities of wine or coffee. Give all the sleep possible.

No. 12. Take a lead pencil in the right hand, and with the thumb and forefinger of the left, seize the lashes of the upper lid, and drawing the lid out from the ball, press the point of the pencil downward upon the upper surface of the lid about one-fourth inch from margin, and at the same time carry the margin upward over the point by the lashes, when the lid will roll over the pencil, so as to show a little groove close to the margin where all foreign bodies lodge, and can be easily removed with a pencil or the finger covered by a handkerchief. The person operated on, must look down while the operation is performed, and while the lid is restored. Bathe in cold water and exclude light.

Sabbath Reading.

MOUNTAINEER'S PRAYER.

GIRD me with the strength of Thy steadfast hills!
The speed of Thy streams give me!
In the spirit that calms, with the life that thrills,
I would stand or run for Thee.
Let me be Thy voice, or Thy silent power,—
As the cataract or the peak,—
An eternal thought in my earthly hour,
Of the living God to speak.

Clothe me in the rose-tints of Thy skies
Upon morning summits laid;
Robe me in the purple and gold that flies
Through Thy shuttles of light and shade;
Let me rise and rejoice in Thy smile aright,
As mountains and forests do;
Let me welcome Thy twilight and Thy night,
And wait for Thy dawn anew!

Give me of the brook's faith, joyously sung!
Under clank of its icy chain!
Give me of the patience that hides among
Thy hill-tops in mist and rain!
Lift me up from the clod: let me breathe Thy breath:
Thy beauty and strength give me!
Let me lose both the name and the meaning of death
In the life that I share with Thee!

[*Lucy Larcom.*

SHALL WE PRAY IN CONCERT?

And now comes a proposition to impose a list of uniform topics upon all the prayer-meetings of the land. As the Sunday-schools are all studying the same lesson, it is urged that all the prayer-meetings would find it profitable to consider the same subject and unite in the same petitions. The Evangelical Alliance submits topics for the week of prayer; "why not," it is asked, "do the same work for all the year? Then all denominations will feel perfectly free to join in the uniformity; the number of particular churches using such a list would increase every year, and before long it would cause another turn to be taken in the chord that binds all the Lord's people together." Sure enough! And why not have the prayers all printed, too, and recited in concert, beginning at the same moment. It would be easy to have the clocks in the prayer-meeting room connected by telegraphic wires with the clock in the Observatory at Cambridge or at Washington; and then, by simply following the ticking of the clock, it would be possible to intone the prayers and all the other exercises in all the prayer-meetings simultaneously. What an inspiring thought it would be, that at the very second when the leader in your prayer-meeting opened his mouth and said "O!"—forty or fifty thousand other leaders, in forty or fifty thousand other prayer-meetings, were all opening their mouths and saying "O!" If there is so much value and inspiration in uniformity and simultaneousness, we might as well have the thing thoroughly organized and efficiently carried out.

There is an instance of something like this on record—Dr. Holmes is our authority—when all the people in the world determined with one accord to lift up their voices and shout, in the hope that the noise would be heard in the moon. The result of this experiment, however, was not encouraging to those who put their trust in the efficacy of simultaneousness. "When the time came, everybody had their ears so wide open to hear the universal ejaculation of 'Boo'—the word agreed upon—that nobody spoke except a deaf man in one of the Feejee Islands, and a woman in Pekin, so that the world was never so still since the creation." It has once or twice occured to us that something of this sort may happen when we get this "cord that binds all the world's people" to simultaneous observances, twisted a little tighter. Everybody will be thinking so much of the fact that everybody else is praying that nobody will pray at all. Clearly this uniform topic and concert business may be carried a little too far. Some degree of spontaneity is necessary in religion, and while there are diversities of gifts we may as well tolerate some diversities of operation.

DENYING SELF.

IT is important not to confound the "self" of personality with the "self" of selfishness; the one simply distinguishes me from all other beings, the other elevates me above them all. Without selfishness a man would be a saint; without personality he would not even be a man. Each of us, then, has a distinct life and character; he is meant to be himself and not another; but was never meant to live for himself. When not tempted to self-righteousness, we may be inclined to self-reliance, to self-seeking, or to self-glorying, under some subtle form. If there is a worldly self, there is also a Christian self, a pious self, a new old man, as it were, and even a self-denying self, having "a show of wisdom in will worship and humility," a superfine spirituality which the Apostle suddenly brings down from its lofty flight with the unexpected rebuke that it is "vainly puffed up by its fleshy mind." Another danger is to carry the putting aside of self to the point of losing one's own personality, so as practically to replace the Apostle's words, "I can do all things through Christ which strengtheneth me," by a statement such as the following: "I have nothing to do, for it is Christ who does all things for me." Now Christ has said, indeed, "Without me ye can do nothing," but He has never said, "With me, there is nothing for you to do." The Apostle has summed up the whole subject in this one verse, "I labor, striving according to His working, which worketh in me mightily." The mighty working is the Lord's, but it is effected in the Apostle, and sets him to labor and to strive.—*From a Tract on Denying Self, by Theodore Monod.*

PERSONAL ITEMS.

Gen. Joe Johnston is 71 years of age.

Queen Victoria has received some Cyprus wine 300 years old.

The poet Longfellow's local tax is $2,230, but one poem squares the account.

No. 26 in the list of Queen Victoria's grandchildren is the girl-baby just born to the Princess of Edinburgh.

Representative Alexander H. Stephens of Ga. is again in very bad health, owing to the labors of his Congressional canvass.

Mrs. Millard Fillmore, the widow of President Fillmore, heads a subscription list at Buffalo for Yellow Fever sufferers, with $100.

Canon Bagot, rector of Athy, a well-known English agriculturist, is doing his harvesting this year by the aid of an electric light.

Beecher's first four lectures in San Francisco brought him $2,300, $2,150, $2,500 and $2,500 again. The East puts no such sums in the drayman's hat.

Apostle Taylor says that Mormonism is stronger than ever since Brigham Young's death. If this is so, the prophet's loss was a profit to the Mormons.

Butler's sixtieth birthday occurs November 5, the day of the State election, and it would not be strange if the General felt like sixty about that time.

William Shakespeare is running for constable in a Michigan village. Yet this is the man who said: "Fling away ambition; by that sin fell the angels."

"Decidedly aristocratic," they say, is Oscar de Lafayette the present marquis, and grandson of his grandfather, though he supports the Republic, of course.

The body of the late Queen Christina was buried in the Escurial at Madrid with very little pomp or fuss. There was a military escort, but very little public regret.

Joaquin Miller arrived home in the City of Berlin on Saturday. Walk-in sang no songs of the Sierras on his way over—not a song, but lay in his berth, sick, silent and sad.

Tennyson is an incessant smoker. He uses a clay pipe of the old fashion, with a stem a yard long, and smokes common Virginia pigtail tobacco. He never uses a pipe the second time.

Constantine, heir to the throne of all the Russias, snubs his little big brother Alexis, our late visitor, and the two do not lodge together in Paris, where they are on a visit to the great Exhibition.

Gen. Butler is a sound sleeper. No uneasy conscience keeps his brain from repose. That's the reason why the old man can do so much work. "I never fret or worry, and go to sleep inside of three minutes every time," says old, active uncle Benjamin.

The recent report that the father of Gen. Tom Thumb is an inmate of a Chicago almshouse, is denied by the diminutive son, who says that the old gentleman died fifteen years ago, leaving an estate worth $70,000.

The Emperor of Germany has left Gastein, cured of his wounds, and has gone to Wilhelmshoe. He was enthusiastically cheered on his way. The Kaiser is desirous of resuming the reins of government next month.

The Hon. B. H. Bristow, ex-Secretary of the Treasury, has formed a law partnership with Messrs. Opdyke & Peete and Gen. H. L. Burnett, of New York city, and will remove to New York as soon as his business in Louisville can be closed up—probably in October.

Lucretia Mott, at the age of 85, weighs less than eighty pounds, but enjoys better health during the last two years than for the previous ten. She sets off every Wednesday alone, from her home near Shoemakertown, and goes to Philadelphia to attend the Race Street Friends' Meeting.

Colonel Mosby will not set out for Hong Kong until December. He has several cases to try before the Richmond Court of Appeals, and these cases will delay him. In putting his girdle round about the earth, Grant, too, may strike Hong Kong about the time his Confederate admirer gets there.

Some recently discovered inscriptions on burned bricks are reported to have brought to light the astonishing revelation that King Ahasuerus hanged Haman because he invented the accordeon and put the price down to one dollar and seventy-five cents, so that every young man might have one.

Friends of General Grant say that for several years his brother Orvil—who has lately been sent to an insane asylum, but is reported to be getting better—has been the cause of great mental suffering to him, and that Orvil has frequently compromised the ex-President by his indiscretions, his wild talk and his eccentricities.

Although Mr. Thomas Carlyle is now past 83, he is so well and strong that he has been making a summer visit to Scotland. His pleasant but simple home in Chelsea—a house nearly 200 years old—is presided over by his niece, an amiable lady of middle age. In the bright gardens the sage comfortably smokes, and twice each day he walks abroad among the quaint and narrow streets of Chelsea, one of the oldest and most interesting parts of London.

Mrs. Van Cott, the preacher, was born in New York city, and is nearly fifty years of age. Her father was Major Newton, manager of John Jacob Astor's estate. He became insane. Marrying and soon becoming a widow, she attended to her husband's business of drug broker. She was converted on a Fulton ferry-boat while thinking about religion. Becoming a preacher she traveled through the country, and she counts more than 27,000 conversions as the result of her labors. She weighs 225 pounds.

A German paper describes Prince Henry of the Netherlands as one of the richest princes in the world. A silver mine in America brings him a princely income, and he has many Dutch, Russian, and other bonds, with ninety-nine properties in Holland—the maximum number, for the King alone can own 100—and some in other countries.

Dr. Elliott Coues, the ornithologist, recommends "abolishing the penalty for killing sparrows, so that they may be trapped and used for shooting matches instead of pigeons or even of glass balls." On the other hand, Dr. Hagen, of the Museum of Comparative Zoology at Harvard, says he considers the sparrow "to be a valuable addition to the native birds and most certainly for both horticulturists and farmers."

"This country," remarked a traveler in Northwestern Iowa, "settles up very rapidly." "Ya-as," replied B. J. Robinson-Smith, the native, nervously watching the movements of a constable dodging along the other side of the field, "country settles up a darn sight faster than the people do." And before the traveler could ask him to explain, he was making a mile a minute across the trackless prairie with the constable a bad second.

Matilda, Queen of the Gypsies, whose funeral at Dayton, Ohio, on Monday, the 16th inst, was attended by 25,000 Gypsies, had in her character as well as appearance a touch of Meg Merrilies She came to this country in 1856, settling with her husband, King Levi Stantley, at Dayton. Her mother, Queen-mother Stantley-Smith, still lives—a Gypsy centenarian, consoling herself in her second century with the pipe that she is too feeble to fix for herself.

Unlike his father, Victor Emanuel, King Humbert delights in royal display and ceremony. He enjoys entering and leaving the large cities of his kingdom in rigid official form, with outriders, aids, and guards, troops in line, and majors in waiting. Last month he enjoyed several fetes of this kind. In Venice a grand illumination and magnificent festivities were given in honor of his arrival, and his departure was after the style of an old-time king.

IMMENSE SUCCESS.

The HARRIS Farm Truck!

Saves the Gage Wheel, half the labor of holding. 12 to 15 per cent. of the draft, team can back the plow, no riding the beam, plow taken to the field, whiffletrees out of the way, no stepping over traces or letting out tugs.

Harrows draw level, turn shorter, do ¼ more work. Holds Shovel Plow, prevents jumping and dodging. On Scraper saves man and team. Handles never get muddy. Will pay its cost in one week.

Just the thing on Stone Boat, Horse Fork, etc., etc.

Hon. Harris Lewis, Pres. N. Y. D. A., says: "The best farm implement for the money, he ever owned."

Prof. Arnold, Sec. A. D. A., says: "It will be considered an indispensable addition to the list of farm implements when once tried."

Hon. T. F. Randolph, U. S. Sen. from N. J., says: "It is desirable because of its simplicity, effectiveness and economy."

Great inducements to one responsible Canvasser or Agricultural Dealer in each town.

Where no agency is established a Truck will be sent freight prepaid, upon receipt of price. Send for testimonials. Price, Farm Truck, $6; Tbills, extra, $2.

LADY (giving an apple to a little boy): "Give this apple to the one of us three here whom you think the handsomest." The boy looked for a moment at all three ladies, took the apple and—ate it.

Environed with Danger.

The dweller or temporary sojourner in a malarious region of country is environed with danger. Besides inhaling at every breath an atmosphere saturated with an infectious poison, he also drinks water which is in most instances likewise impregnated with the fever and ague breeding *miasmata*. If a bilious subject, deficient in stamina, or irregular in habit of body or digestion, his peril is much increased, as these abnormal conditions are extremely favorable to the contraction of malarial disease. But this danger may be safely encountered with the assistance of Hostetter's Stomach Bitters, which completely nullifies the atmospheric virus, and neutralizes the constituents of miasma-tainted water. This benign antidote to disease eradicates and prevents fevers of an intermittent and bilious remittent type, besides effecting a thorough and permanent reform of those enfeebled or irregular conditions of the system which invite not only malaria, but other diseases equally to be dreaded.

Farm Topics.

ADDRESS OF THE FARMERS' ALLIANCE.

To the Farmers of New York:

The Farmers' Alliance of this State was organized in Rochester, March 21st, 1877, to unite farmers for the protection of their interests, and to remedy evils of which we justly complain. First of these is the unequal assessment of taxation, whereby most personal property escapes taxes, and the burden of supporting the State and local governments is borne mainly by real estate. This inequality yearly grows greater. In 1871, the real estate of New York was assessed at $1,599,930,666, and its personal property at $422,607,732. As the personal property of the State equals, if it does not exceed the value of the real estate, these figures show that six years ago, nearly or quite three-fourths of the personal property of the State was untaxed. In 1877, despite the heavy depreciation of real estate, it had swollen on the assessment rolls to $2,376,252,758, while the assessed value of personal property had declined to $379,488,148. Taking the same rule as before, that personal property equals or exceeds the value of real estate, it shows that six-sevenths of such property is untaxed, Real estate is increasing its assessable value more than one hundred millions of dollars a year. Personal property is decreasing ten millions of dollars a year. While the burden on real estate is thus increasing, it is notorious that it is the least productive kind of property, and costs least for its protection. Personal property, six-sevenths of which is untaxed, costs most for its protection and is best able to pay taxes. We demand laws which shall reach the untaxed personal property of the State and which will apply the same rule, in exemption for debts, to personal property and real estate,—either allow real estate owners to deduct their indebtedness, as owners of personal property now do, or require the latter to pay taxes on all property held by them without regard to indebtedness. Under the present law, only real estate owners are required to pay taxes on their debts. Justice demands that the same rule be applied to both kinds of property.

A second cause of complaint is the discrimination against local freights by the through lines of railroads. The products of the great West are carried through our State for lower rates than are charged to our own people. The corporations which do this owe their existence to the people of this State. This discrimination largely decreases the value of farming lands, and paralyzes not only agriculture, but every form of productive industry in this State. We demand just rates for local freight, and in this demand we have the earnest and active support of nearly all classes of business men.

The third grievance which our Alliance seeks to remove is the monopoly in the Insurance business, whereby farmers are compelled to pay exorbitant rates for insuring their property. We demand a law for legalizing such insurance companies as the Grangers have organized in some counties in this State. With such a law the insurance monopoly will be broken, three-fifths of the cost of insurance of farm property will be saved, and the security will be at least as good as now.

Farmers of New York, these are the measures which your Alliance was organized to secure. If the evils which we would remedy affected any other class of citizens, a general uprising of that class would demand and secure their removal. Unfortunately farmers have been too isolated to combine and protect their interests. With the organization of Granges, local Alliances, Farmers' Clubs, and other local agricultural societies, united effort becomes possible. In the measures above outlined we can certainly unite. Their adoption will add several hundred millions of dollars to the value of farm property in the State without doing injustice to any.

The numbers and natural political influence of New York farmers insure success in any measures which we unitedly demand. All that farmers need do to secure their rights, is to so far forego party prejudices that they will not vote for candidates for legislative offices who are not identified with our interests, and fully pledged to secure the reforms which we ask. If this is done now, the next Legislature will contain a majority favorable to the interests of farmers. We ask nothing save what is just and commends itself to every sensible mind. If farmers will not forego party to protect themselves, the dominance of rings adverse to the agricultural class, will be more decided than ever before.

What we wish is this:

First: That every farmer shall urge the nomination of legislative candidates who are fully identified with the interests of farmers. Failing this in their own party, farmers should vote for good and true men nominated by the other parties.

Second: We need some money—not much. All that is required is to arouse the attention of farmers of this State to the effort now being made. When this is done the organization of local Alliances to promote these reforms will follow as a matter of course. If this Address and the Platform of the State Alliance, can be placed in the hands of every farmer of the State, all after work will do itself. To distribute these documents and furnish money to perfect our work through the State, we rely upon existing organizations. By a resolution adopted at the late meeting of the State Alliance at Syracuse, Sept. 4-5, the Secretary was instructed to issue an Address, and to call upon every Grange, Farmers' Club, local Alliance or other Agricultural Society, for the sum of *three dollars* to be sent to the Treasurer of the Alliance, Mr. Jesse Dewey, Churchville, Monroe Co., N. Y.

This appeal is issued in accordance with instructions of the State Alliance. Let us add an earnest personal request that the small sum of money asked for be promptly forthcoming. Three dollars is not much to pay for each of the six hundred or more agricultural organizations; but it will furnish a fund which will insure success to the reforms which we propose. Besides, we are very sure that when any body of farmers take enough interest in this cause to help it forward three dollars' worth, they will follow up their work and do whatever else is needed to make it entirely successful. But if they will not do so much as to send three dollars for this reform, it will be absurd to expect them to take any further interest in the matter.

To distribute this address so as to place a copy in the hands of each of the four hundred thousand farmers of New York, is an arduous work. Any help thereto will be regarded as a great favor. Agricultural and other journals in sympathy with this movement are requested to publish this address. Copies will be sent to every Grange, Farmers' Club, Farmers' Alliance, and other agricultural organization in the State. As many additional copies as are needed will be sent on application.

Harris Lewis,
President, Frankfort, N. Y.

Wm. J. Fowler,
Secretary, Pittsford, N. Y.

HINTS BY THE ROADSIDE.—No. 3.

THE DISTRICT SCHOOL.

I am afraid the good influence of the schoolmaster is fast departing from the land, so far as the rural part of the nation is concerned. Is it possible that all the intelligence as well as the enterprise of our country is to be driven to the villages and the cities? In a ride of ten miles, which I frequently take, I pass by four schoolhouses. One of these is upon the border of a village of six or eight hundred inhabitants. The house stands about half in the road, dusty, with not a shade tree; while the windows are small, and the out-houses only passable. This is by far the best of the four.

Number two is also half in the street, and has not a shade tree; its out-buildings are broken, the doors are off, and there is no privacy whatever. The steps to the house are broken and uncouth, the windows small and roughly boarded, while a glance inside shows less taste than in the log school-house where I learned my A. B. C.'s, forty years ago.

Number three is at the fork of three roads, is roughly boarded, with free ingress and egress for the winds and elements. Not a shade tree, and not an inviting feature.

Number four has even less to attract the attention or set an example of taste or education for either teacher or scholar.

Are these the places in which we farmers expect our children to learn to love rural life? Are these the examples of taste and culture which are to elevate the next generation to the rank of intelligent beings? Is it not possible for the more affluent, well-to-do farming communities to set an example of taste and intelligence in the location, construction and surroundings of a neat house for schools and occasional lectures and meetings? But as these are only "hints" I will not make them into a lecture.

A TRAMPS' HOME.

While speaking of educating our children, there is another class of persons I meet along the roadside besides our children; I mean the tramps. These mostly walk at night, and possess themselves of whatever they can wherever found. These, too, must be sent to school and educated. Any being, tramp, insane, idiot, or criminal, is a child, and must have the educating care of the community. They must be taken to homes provided for them and educated, restored to manhood, and again prepared for caring for themselves. The farmers cannot do it alone, but they can ask the people of the State to establish a farm and workshops, where every man acknowledging himself unable to take care of himself, shall be set to work, fed, clothed and educated.

HOME MANUFACTURES.

In this era of machinery and inflation, I fear that our farmers are losing very many of the little sources of industry and employment which rightfully belong to farm life. My neighbor Underhill has five boys, and I see that each of them has two nice straw hats, one with a wide brim for the farm, and one with a narrower brim, and more nicely made, for Sundays. These hats they braided and sewed themselves from oat and rye straw. These straws are the first joint from the head downwards, cut and stripped of the outer husk, wetted and braided, some in five, some in six and others in seven strands together, in a great variety of ornamental styles. These hats are just as good as those costing $1 each at the village, while the making of them teaches the boys mechanical ingenuity.

As butter-making has been very unsatisfactory this season, some of my neighbors have thought of making a few cheeses, as a variety in diet, but wherever the effort has been made we have sadly found that we must learn over again the nack of doing this business in a successful way. Our home industries, alas! are among the lost arts, I fear.

FARM PROFITS.

I hear many of my neighbors expressing doubts about the profitableness of farm life, and wondering if it would not be better to go to the government lands and begin anew. If the boys want to begin there, it may answer; but for us farmers over fifty years of age, who have a homestead and a family, associations and society, we had best stay where we are, husband our strength, look carefully to the ins and outs, and bear the little ills we have rather than fly to those we know not of.

The profits of farming are fully equal to the profits of any honest legitimate business at the present time, while the care is much less, and there is little danger that what we have will take wings and fly away. If there is but little to sell, we must have but little to buy. A carefully cared for vegetable garden, early planted and well tended, and a well kept poultry yard, with milk, butter and corn, rye and wheat bread, will prevent having to purchase much.

And this reminds me that my neighbor Smith has never purchased a barrel of flour in all his farming life of thirty years. His father raised good crops of wheat, and he raises all his family need and some to sell. He takes care to buy up all the ashes, and to compost all the straw he can, and to return to the soil as much as he takes away from it. Our boys would have less "heart-burn" and better digestions if they ate more corn bread with their pork, more beans and less of some other things. The celebrated "Hog and hominy" diet, so often referred to in the Gulf States, has much more of health than is usually attributed to it, from the fact that one so perfectly supplements the other in ingredients.

Hough Handel.

Farm Economy.

RAISING NEW PRODUCTS.

There are many things which are profitable for the farmer to raise which are not now generally produced in his locality, and some not in the United States; and if farmers more readily changed to new products, or sought out the special needs of their localities, more profit would result. The first purpose should be to raise everything wanted on the farm which it is practicable so to do, so as to prevent, if possible, the necessity for purchasing anything. The next effort should be to raise something which will be the most readily marketable at the nearest point. If near any considerable town, fruits and market gardening may be desirable, and so are fine butter, fresh eggs, early fat lambs, fat poultry, fat calves; but never produce any second-quality stuff. Let your products be the best or have none.

If farther removed from large towns, the more staple articles of grain, cattle and vegetables, may be the most profitable. Sheep-raising is an employment sadly neglected in the rougher, hillier regions, where they should be oftenest found, and where they are most easily raised. Raising beets for sugar, is one of the most necessary industries which should be established in the United States, and it is to be hoped that small factories for making beet-root sugar may be established in many localities at an early day. Barley is always in demand in the United States beyond the home production. Flax fiber carefully prepared, is one of the best paying crops. Oils of mint, camomile, poppy, wormwood, mustard, and a great number of other plants can be profitably produced in many parts of the country. Chicory grows wild by the roadsides from New England to Ohio, is raised as easily as parsnips, and enters largely into the preparation of coffee, to which it is said to give strength while it is believed to be otherwise valuable. It is now chiefly imported.

In climates where they will grow, hemp and jute offer valuble additions to farm crops; there is also a market at 75 cents to $1 per pound for the wool of the Angora goat, and in rough, hilly locations, they may be kept at a profit. Large quantities of rye and oat straw, cut from the upper joint to the head, are in demand for hat and bonnet makers.

Starting tomatoes and cucumbers in the house, or with cabbages and lettuce in a cold-frame; sowing radishes and peas early and at successive intervals, and a great number of similar operation, give a better supply of food at home and often enable the farmer to pay quite a little store bill for necessaries.

BETTER CULTIVATION.

There is no doubt that the only way out of hard times for the farmers is a better cultivation—to expend on ten or twenty acres the same amount of labor and of manures that has heretofore been expended upon one hundred. The gross receipts may not be as large, but the net profit will be greater. The force of the farm is now expended in getting over a great deal of ground, while not half tilling the land or half economizing either that, the material or the labor. The farm should not be simply a place requiring a great deal of walking, digging and harvesting to return a little cash. Like any other business, it should be immediately under the eye and hand of the master and his workmen, and we do not hesitate to say that twenty-five acres of land are all that any one organization, consisting of the farmer and his family and one or two hired men, can attend to profitably. There is no profit, no leisure, no time for recreation or books, in the present farm system.

The ambition to own a great number of acres, and the belief that the land will bear forever without manure, have brought the farm system of the United States to a state in which there is neither profit nor pleasure to anybody. If nine farmers out of ten, in the eastern part of the United States, would carefully attend to the best twenty-five acres of their farms and let the rest grow up to weeds and bushes, they would be better off in ten years than they will be if they follow their present plan, trying to skin over one hundred or two hundred acres. It is only perfect tillage and consequent good crops that bring any profit; only the fat cattle and hogs, fat sheep and poultry, and fine horses that pay for their keep. All the poor crops, the poor butter and cheese, and poor stuff of any kind, actually cost the farmer more than he gets for them, besides wearing out in drudgery the lives of his wife, his boys and his girls, disgusting them with farm life, and causing his own death in poverty before old age has come near him.

But the farmer says, "Preaching is easier than practice," and "It is hard to teach an old dog new tricks; what our fathers taught us we must follow until a new system begins at the root and extends over the country."

But such a system must have a beginning and beginnings are always small, and, moreover, this is not all preaching. Let the farmer who has ten acres under the plow begin this fall by leaving five of those ten acres idle, untouched; let him plow the other five thoroughly twice, turn every furrow smoothly, take off every species of rubbish not covered, put all the manure intended for the ten acres upon the five, and, if sowing this fall, see to it that the grain is thick enough, yet not too much so, and that it is harrowed thoroughly and as smooth as the house floor. In the spring, plow again the portion of the five acres not sown carefully with a modern steel plow, harrow, and if not in perfect tilth, plow again and harrow, and then plant and sow, and use the hoes and cultivator twice in the corn field where heretofore used but once, pay double attention to the garden, double attention to keeping the tools under cover, double attention to raking up, piling up and turning over a compost heap, double attention to the fences and the care of stock; give one hog all the feed that two had before, one calf all the milk that two had formerly; in short, spend just as much labor, time and care upon one-half of all you had before, and no one need doubt the result.

The farmer continuing in this way for a few years, will find he has time to think, to rest, to read and inquire a little further how to increase the profits of his labor by new crops, or better systems of care and cultivation. Remember that plowing three or four times and loosening the soil very deep is not labor wasted; that fifty tons of finely-rotted manure to the acre are none too much, and that the cultivator can hardly be run too often.

Major.

IRRIGATION.

In many places there are large tracts of land to which it is difficult to get water, and which, especially in dry seasons, are practically valueless for grass or cultivation. There is hardly a farm in the eastern half of the United States without such plots, large or small, which it is desirable to restore to usefulness

Where the soil is not too thin to allow of deep cultivation, the remedy is an easy one, but where the rocky formation comes up to near the surface, or where such cultivation is impracticable, some other remedy must be sought for. If the outlay needed to carry a stream of water to the location, either by the use of a hydraulic ram, a wind-mill or a water-wheel, cannot be made, then places should be provided to catch the rainfall, either by damming across a depression or the sloping sides of an elevation, or by excavating one or more basins for holding the water. In a dike or dam, an overflow-pipe of wood or drain tile, is needed to prevent the walls from washing away. This is best made by having the end of the pipe elbow-shaped and rising just as high as it is desired that the water should rise, while the pipe itself runs out under the embankment, rather than by

letting the water run in a sluice over the dam. The water from a few basins excavated in a suitable place, with shade tress or elder bushes planted around them, and some rushes and water-grass on or near their banks, will hold, upon an almost barren hill, a supply of water sufficient to render a very large tract valuable as pasture or meadow. Furrows, terraces or other slight obstructions to prevent the rapid running off of the water, are also valuable.

A nursery of shade trees, Chestnut, Oak, Hickory or Maple, can be grown very easily and add materially to the value of these treeless pastures and otherwise barren places. Pasturing with sheep, to be yarded at night in an inclosure so as to prevent dogs from killing them, has restored many such wastes. A pasture is no doubt increased in value in every way by the presence of a growth of timber, if growing fifty feet apart each way.

Upon sloping land there are very few crops that are not increased from one-fourth to one-third by the trickling of a stream of water along the upper edge of the field; and the outlay for a wind-mill or a hydraulic ram and the pipes and basins necessary to convey and hold the water, is one of the best investments as a fertilizer, which the farmer can make. The most practical means of conveying water is by the hydraulic ram, but if there is a sufficient stream to carry a water-wheel so as to give a much larger supply, the increased expense is well paid out.

WEEDS.

THERE cannot be any good farming where weeds are allowed to run riot among the growing crops, and any farmer who permits quantities of foul herbage to grow around the outside of his fields, in the corners or on any parts of his farm, is no patriot, no man worthy of admiration or to be influenced by in any way. Yet in many neighborhoods there are men wishing to take the lead, whose farms are so covered with weeds that for the life of them, they could not cross any of their fields without treading on weeds at every step. Let any rational man think for a moment of the vast extent of injury such a farmer causes to his neighbors for many miles on every side. For, to say nothing of the action of the wind in scattering the seeds of many weeds, great quantities of them are eaten by birds which afterwards visit farms whose careful, tidy owners take much trouble to keep them free from weedy pests. But it is well known that seeds grow after passing through the bodies of birds, so that these clean fields are sown with weed seeds from the droppings of these birds, and soon either become as foul as those of the negligent, pestiferous neighbor or cause their owners a world of trouble to prevent such a calamity. Indignant public opinion should be brought to bear sharply on any land-owner whose weedy lands are a disgrace to himself and an injury and nuisance to the neighborhood. G. G.

Horticultural.

PAPYRUS.

ALL the interest of history is not confined to *things*, for the words that designate them also sometimes have a history at once interesting and instructive. Some of these, which from their vernacular form, familiar use, and the comparatively recent introduction of the objects they indicate, one might readily suppose to be of modern and domestic origin, have, nevertheless, a history extending back to ages so remote that history in them is lost in fable, and to lands which knew not even of the existence of the countries in which these words which they originated, have found so congenial a home. Of these, the word paper, is an excellent instance. In using it how seldom is it ever associated with antiquity! Yet when the youthful Moses was learning all the wisdom of the Egyptians, the word he used in speaking of the substance on which much of that wisdom was written, was almost identical in sound with that employed by the school-boy of to-day in speaking of the substance on which his lessons are printed; for the youthful Moses called it *papu*, while the school-boy of to-day calls it paper. And long before Moses was taken out from among the bulrushes, long before Joseph was taken down into Egypt, the same word was in familiar use among the dusky sages who, in that land of mystery, were the chief possessors of the wisdom of the world its youth. Later on, the Egyptian word was corrupted by the Greeks into papyrus, and this in its turn has been corrupted into paper by the English-speaking people. Another name given to it by Herodotus was byblus, whence the Greek word biblion, a book, and our word Bible. But while among us the word has no reference to the substance of which the material it designates is composed, the ancient word was applied not only to the manufactured article, but also to the plant of which it was made.

This was a kind of reed, belonging to the family of Cyperaceæ, or sedges, and growing to the hight of from eight to ten feet. It had very strong, woody, aromatic roots; long, sharp-keeled leaves, and a naked, triangular, soft and cellular stem, as thick as a man's arm at the lower part, and at the upper extremity bearing, in the form of a large, compound umbel, a multitude of drooping spikelets, each containing from six to thirteen florets. It was grown very extensively as a government monopoly, in pools of still water, and along the river bank, in the districts of Sais and Sebennytus, in the delta of the Nile, and there only. It was used for a great variety

A PAPYRUS PLANT.

of purposes besides paper. Its plumes crowned the statues of gods and decorated their temples; its pith was boiled and eaten as food, wicker-work boxes, baskets and boats were woven of its stalks; while sails, cordage, cloths, mats and sandals for the priests, were made of its bark. It furnished material for candles and torches, was used as medicine for the cure of ulcers and fistulas, and its roots were used for fuel and manufactured into household utensils. So rare is the plant in the present day in Egypt that many suppose it never to have been indigenous there, but to have been introduced either from Syria or Abyssinia, in both of which places it is now found, here and there, growing wild. As its cultivation was confined exclusively to northern Egypt, if introduced at all, it must probably have been from some country to the north of the Delta, and therefore most likely from Syria.

The upper portion of the stem was internally much like a rush and entirely unfit for making paper. This was manufactured exclusively from the lower part which had been immersed in water and mud. This portion was whiter and more compact than the upper and, instead of cellular pith, it consisted, inside the outer coarse skin, of a number of concentric layers lying one over the other. These were removed and laid on a smooth, flat surface, side by side, with the edges overlapping each other; and crosswise upon them were placed, at right angles, one or more similar layers until the sheet was sufficiently thick. Pressure was then applied so as to cause the different slips and layers to adhere to each other and form a single sheet, which was then dried in the sun. The sheets were finally beaten smooth with a mallet and polished with a piece of ivory or shell. The width of the sheets depended, of course, on the length of the papyrus stems taken; but their length could be extended indefinitely by joining a number of square slips together by glue or any adhesive matter. When finished, the papyrus was rolled upon a wooden cylinder, called scalpus, the ends of which projecting beyond the edges, were handsomely ornamented. The length of each roll was generally formed of twenty square slips, and its width varied from about four to eighteen inches. When newly prepared, the paper was white or brownish-white and pliant, but in process of time, the papyri which have reached the present day, have become of a dark-brown or nearly black color, legible only in a favorable light, and so exceedingly brittle that they are apt to break at a touch.

As the various layers of papyrus, usually twenty in number, decreased in thickness as they approached the center of the stem, the manufacturers were enabled to produce paper of different qualities. The finest was made from the innermost membranes and was called Hieratica, or paper for the priests, who interdicted its sale until covered with sacred writing. In this state, however, it was largely exported, the hieroglyphics skillfully removed, and the paper used for any desirable purpose. Inferior to this were seven more grades, the poorest of which was only used for wrapping paper.

The papyri taken in late years from tombs in the pyramids and elsewhere in Egypt, are generally written in black and red, but some are ornamented with other colors and with gilding, while others are adorned with vignettes many of which are remarkable for the delicacy and beauty of their execution. They may be divided into three classes, written respectively in the hieroglyphic, hieratic and demotic characters. The first are mostly books of religious or moral character, the writing is readable generally from right to left, sometimes from left to right and occasionally from top to bottom. In the last case the lines are inclosed in ruled spaces, while in the first and second they are to be read in the direction opposite to that towards which the figures which chiefly form the writing, are turned. The oldest specimen of these, and probably the oldest writing in the world, is a treatise on good manners, 10 inches wide and 150 feet long, now in the National Library of France, and written by Prince Ptah-hotep in the reign of his kinsman, King Assa-Tatkera, of the fifth dynasty, 5,378 years ago, or 1,520 years before Abraham visited Egypt, according to Bishop Usher's chronolgy. Hieratic manuscripts contain the great body of Egyptian literature, and from extant specimens of that running mode of writing, it must have been largely used as long ago as 2000 years before Christ. The oldest specimen of demotic manuscript now known is of the date 620 years B. C. and may therefore be regarded as quite modern according to Egyptian chronology.

FURTHER TRIAL OF SEEDS IN 1878.

PROFESSOR W. J. BEAL.

THE articles written last year, and first published in the RURAL have since been extensively copied. They have received many hearty comments of approval from editors, granges, farmers' clubs, seedsmen and others.

I wished to test the vitality and purity of the seeds sold by some of the seedsmen who make extensive sales and who have a good reputation. As I feared I might not get fair average samples of seed if they were ordered directly over my own name, seeds were ordered for me by a friend in a distant county of this State. They were tested in the greenhouse.

B. K. BLISS & SONS.

A COMPARISON.

Below I give a table comparing the same varieties of seeds of each firm, the seeds of which were tested. I give the per cent. of seeds which germinated in each case, then the average for the eight varieties:

	Bliss.	Ferry.	Gregory.	Henderson.	Thorburn.	Vick
Beet	79	82	83	73	82	68
Carrot	59	67	80	65	97	59
Cucum'r	93	90	82	75	45	77
Cabbage	75	62	91	71	65	89
Lettuce	75	3	2	68	82	69
Onion	43	78	46	85	95	84
Parsnip	78	85	79	71	89	61
Tomato	51	20	96	69	51	61
Average	69	61	70	65	76	71

The average is not exact, but very near in each case. The above seeds were tested together in the same room of the greenhouse. Perhaps the most striking thing in the last table or in all of them, is the uneven size of the figures. THORBURN sent out some poor seeds of cucumber and cabbage. VICK, some poor seeds of beets and parsnips. GREGORY, poor seeds of onions, and very poor lettuce; BLISS, poor seeds of onions, carrots, etc.; HENDERSON, some poor seeds of cucumber and a low average of everything; FERRY, poor seeds of tomato, and very poor seeds of lettuce.

I believe all of the above firms refuse to guarantee that their seeds will grow, but claim to exercise all diligence in testing their seeds before sending them out. The best I can say for the above seedsmen, to those who prefer t buy vegetable seeds rather than raise them—is this: *buy early* and then test them for yourselves before sowing for the main crop.

SEEDS TESTED IN THE GARDEN.

Some persons may think it the fairest kind of a test to plant seeds at the proper time in good garden soil in the open air. In such a place it is next to impossible to protect them from damage from various sources, such as moles, mice and numerous kinds of insects. In the open air, so far as testing the germinating power is concerned, the results are more unsatisfactory than when tested in the greenhouse, especially if the test is made on a small scale. On an even spot of sandy loam, on May 18th, we planted most of the varieties named of each of the firms above. The seeds of BLISS averaged 53 per cent. GREGORY, 48; BRIGGS BROTHERS 31; VICK, 51; THORBURN, 44; HENDERSON, 43, FERRY, 34. It will be seen that the results are not so favorable for the seeds as when tested in the greenhouse.

Agricultural College, Lansing, Mich.

SEEDS.

FREQUENT complaints are made that seeds do not germinate, and dealers in them are found fault with, when, very generally, the fault lies in the improper manner in which people plant them. Many take no heed of the condition of the soil or of the depth at which the seed should be planted. The temperature and moisture also have a controlling influence: the temperature of germination of the following seeds is:

	Lowest.	Highest.	Most rapid.
Wheat	41° F.	104° F.	84° F.
Barley	41°	104°	84°
Pea	44°	102°	84°
Corn	48°	115°	93°
Bean	49°	111°	79°
Squash	54°	115°	93°

Air-dried seeds will imbibe water of absorption completely in from 48 to 72 hours, in the following percentage.

Mustard,	8	Buckwh't,	17	Oats	60	Pea 107
Millet,	25	Barley	49	Hemp	60	Clover 118
Corn	44	Turnip	51	Kid'y beans	96	Beet 121
Wheat	45	Rye	58	Horse "	104	W. clover 127

The great difference in the amount of water absorbed by mustard and clover seed is worthy of notice. The failure of clover seed to catch, frequently arises from sowing it at a time of insufficient moisture, and can be obviated by first soaking the seed, to supply the necessary humidity. Millet generally seems a good catch even in dry, hot weather, as a small amount of moisture answers for that seed.

Soaking seed in plain water, however, entails certain disadvantages. If we examine the water in which the seed is soaking, we find that it soon becomes brown. It has, therefore, dissolved some substance from the seeds; has actually macerated them. If we pour off this brown water and let it stand exposed to heat, it soon gives off the smell of ammonia, proving that it has soaked out nitrogenous matter, which nature has evidently stored in the seed for the nourishment of the young germ.

This seems to prove at least that this substance is readily soluble. Moreover, the young plant from seed that has been soaked in water will be correspondingly weaker and of a paler color than that from seed not subjected to this ordeal, and the longer the action of the water has continued, the more evidently will this be the case. Another objection lies in the fact that

seeds soaked in water very quickly dry, and the evaporation of the water leaves them drier than before. Such seeds, therefore, frequently perish in dry soil or during a continuation of warm weather.

The evils that result from soaking seeds in pure water may, however, be easily avoided by soaking them in a solution of some chemical salts of a fertilizing nature. In consequence of the quantity of salts the solution contains, it can dissolve but little from the seeds, while on the contrary it completely impregnates them with its fertilizing ingredients, so that the young plants from seeds so treated appear decidedly stronger and darker in color. Moreover, the seeds are not liable to dry up after having been steeped in this way, but in consequence of the hygrometric properties of the saline substances which they contain, they always continue moist. Manuring the seed by means of steeping is of great importance. That it produces a decidedly quicker and stronger growth of the young plant in the first fourteen days is certain, as it supplies it directly with the nutritive substances which are required for its vigorous development at the time it is just beginning to grow, and while its organs are yet unfit to seek nutriment over a wide range of soil. The vigorous development of the plant while young is, moreover, a sure guarantee of its full perfection and ultimate ripening. To apply manure directly to the seeds in this way is a quicker, cheaper, more efficacious and less laborious method of fertilizing them than to place compost in the hills or drills, and moreover the weed seeds then get none of the fertilizers which they share with the good seeds when composts are used.

Manure for the land, except coarse barnyard manure, should be spread broadcast and harrowed in, thus enriching all the soil. The roots then have a larger area on which to feed, as they will spread themselves out if properly started, and the soil all around them is in proper condition to nourish them. The Chinese are adepts in the art of agriculture, and their seeds are manured before planting them.

It is hoped that this brief article will call the attention of RURAL readers to the subject of which it treats; and if it effects only this object, good will grow out of it. The adoption of the plan it advocates will largely increase the crops of the country at a trifling increase of expense for fertilizers, and the saving in seed will more than counterbalance this increased outlay; for, when seeds are steeped in the manner here recommended, a bushel of wheat will be sufficient where a bushel and a half are required when not subjected to such treatment. This opinion is not a mere matter of theory, but the result of actual experiments conducted on a large and small scale, and confirmed by the experience of many others.

Plymouth Co., Mass. ANDREW H. WARD.

[We do not wish to pit our judgment which is *not* based upon experience against Mr. WARD'S that is. But it seems to us that the albumen in seeds that are albuminous and the cotyledons in seeds that are not, furnish all the "manure" that the tender embryo needs.—EDS]

Floricultural.

THE OXALIS.

OF this fine house-blooming plant I find some twenty different varieties described, varying in color and size of blossom, size, etc. of foliage and habit of plants. Some of the varieties remain in foliage an indefinite time, and are constant bloomers. These have white or pink blossoms; but both foliage and blossoms are small, the root is tuberous, scaly, or jointed. Planted in pots of good soil I have had them growing and keeping in blossom for months at a time, summer and winter, when cared for. They will not, however, bear drying off like some of the choicer varieties with bulbous roots. At present there is in my bay-window a small, six-inch hanging-basket of a pink Oxalis, the blossoms of which measure an inch and a quarter in diameter; each average foliage leaf measures 2½x2½ inches. The leaves are heart-shaped, and not as deeply lobed as those of the smaller varieties. The leaf-stems are from ten to twelve inches long, the leaves hanging pendant. The seed-stalk is about the same length, about twice as thick, and the size of a large rye stem near the root. These are surmounted by six or eight blossoms and buds, the terminal strongest bud opening first, others following at intervals of two or three days. They continue in blossom for several weeks, not all of the stems showing blossoms on them at the same time. A yellow-blossomed variety, the blossoms of which are a little more than half as large, and whose foliage is smaller, is a fine aid to variety. I have this growing, but it does not seem to blossom as freely as it has done in past seasons, owing in part, I suppose, to overcrowding in the pot.

The culture of these varieties is quite simple, as they only require the ordinary care given to pot plants. They should be potted in fair soil the same as common house plants; should have a sunny position in the window, and not be suffered to want for water, although they will thrive in a somewhat dry soil. They have their season of rest and of growth, the latter during our winter, although I suppose this may be changed. My mode of caring for the bulbs, when at rest, is to shake them out of the potting soil some weeks after the foliage has entirely disappeared, put them away in boxes in a dry closet in the house, and there let them remain till they begin to send out fine, white shoots, when they are ready for repotting. Five or six bulbs are sufficient for an ordinary six-inch pot. Usually they are ready for potting in September or October, going past in April or later.

If one wishes for an abundance of blossoms without reference to size, the pink and the white Oxalises referred to above, will give satisfaction. One or two pieces of the roots, planted in a six-inch pot, will in a little while fill the pot with foliage, which will throw up in succession blossom stems with several buds to each, opening in clear, sunny weather and closing at night, each blossom going through this same routine for several days. Where more variety is desired, and only for a season, the larger kinds with bulbs for roots, will give more satisfaction. These increase something after the manner of potatoes, only very much less rapidly, the small bulbs requiring a season or more of growth before coming to the blossoming stage.

Worcester Co., Mass. W. H. WHITE.

OLLA PODRIDA LETTER.

MARY WAGER-FISHER.

Fairmount Park and its influences; Coleus; Perilla Nankinensis; Pyrethrum; Cypress Vine; Queen Margaret Asters; Vincas; Ferns; Bouquets; English Walnuts and Black-walnuts; Communism vs. *Individual Ownership.*

I HAVE lately been spending a portion of two or three days at Fairmount Park, where one might spend a week without exhausting its beauties. Although the entrance to it is but a few miles' drive from my door, I never extend my drives into it without thinking how wonderful it is, how incomparably finer than any other park in the world—its old trees, its rivers, its bridges, gardens, architectural beauties; in brief, everything pertaining to it is so magnificent, so large, so free! But what was in my mind to mention as of possible interest to RURAL readers who were here at the Centennial and saw the sights about Horticultural Hall, was, that the floral display grows finer year by year, while the interior of Horticultural Hall is so incomparably superior now to what it was then, as hardly to be recognized as the same place. Will the eyes that saw the foliage beds, and the flower beds, in front of the Hall, as seen from the veranda on the top, ever forget the view? I opine not, and wherever one journeys now in the environs of the city, he is reminded, by the attempt at imitation everywhere seen, of what may be called the carpet-gardening of Fairmount. The influence exerted by the Park in floriculture, while all over the country undoubtedly very great, is naturally more pronounced in the neighborhood, where residents have frequent access to the grounds and pattern after the designs. The immense beds of Pelargoniums and of Coleus convert one at once to the doctrine of massing flowers, at least until he comes upon great plots where Cannas, Castor Beans, Petunias, Ageratums, Globe Amaranths, Gladioli, Vincas, Nasturtiums and other perpetual bloomers, form a kaleidoscope of color,—and then he hardly knows which style he best likes, and finally wisely concludes to adopt both.

Unless one has a conservatory, it is very difficult to winter through enough Coleus to plant a sizable bed of it in the spring; at least that is my experience. Bugs attack the plants sooner than anything else, and in a short time the vermin appear on every live thing about them. So I have discarded Coleus almost entirely, and rely upon Perilla Nankinensis and Pyrethrum (Golden Feather) for foliage effects. The Perilla is of very easy culture, as well as the Pyrethrum, and, as both grow from the seed, I recommend them to RURAL readers for special culture.

For indoor decoration for September and October, I know of nothing prettier than Cypress-vine—Quamoclit. As one knows, it grows from fifteen to twenty feet high, so that on cutting it off at the bottom, string and all,—and if two or three vines have twined about the same string, all the better—one has a lovely wreath, several yards long, to loop about window and picture frames. The ends out off should, of course, be placed in a vase which is daily filled with fresh water. The vines will continue to grow and blossom, and remain fresh for a long time.

Just now my bed of Queen Margaret Asters is at the hight of its splendor—a mass of purple and red of all shades, of white and tinted colors: then I have them in pots and boxes, for indoor ornament, so soon as in full bloom. I sink the pots in the earth in the early summer, where they are left until the Asters bloom. When taken out, fold a white paper neatly around the pot, and it is presentable for any place in the house. A shelf or mantel filled with them, is by no means an unpleasant sight to behold. As a background for bouquets that are set against the wall, the leaf of Ricinus (Castor Bean) is quite effective. Of course, for small bouquets, a small leaf should be chosen; for large and striking bouquets, I know of nothing just now more effective and simple than stalks of Perilla and Golden-rod together—gold on a dark-red background.

I went into the woods this morning to take a look at the Ferns. I found them only beginning to take on a golden hue. Within the coming fortnight, the harvest of Ferns for pressing should be made, and they are too pretty to be neglected by any woman. It is none too early to secure dry sand for filling baskets and vases in which to arrange grasses, autumn leaves, etc., for winter bouquets. These things can be far more artistically arranged by being stuck in sand than if tied in bunches. A made-up bouquet, the skeleton of which is made up of sticks and wires and string, is to me detestable. I want *honesty* in a bouquet as well as in furniture. I never like to snip off simply the head of a flower—I want it stalk and all.

I have been amused at Col. Curtis' concern over his English Walnuts. We have a tree in the lawn, planted by my father-in-law twenty years ago, which yields a peck or more of walnuts every year. It stands on a southern slope, and is protected at the north by a group of trees, and at a little distance away is the dwelling house. As a matter of taste, I much prefer the Black-walnut, and a few rods from my window stands one, fully forty feet in diameter—a magnificent tree, loaded with nuts. It is a good plan to encourage children to plant nut orchards.

The spirit of communism so abounds in Philadelphia, that land-owners will be obliged to hedge their possessions about with high stone walls, as they do in Italy, in order to enjoy gathering their own nuts and fruits. There is great pleasure in giving, but not a bit in having the results of your toil taken from you by vandals and vagabonds, without your leave or liking.

Bryn Mawr, Pa., 2d week in September.

VARYING THE APPEARANCE OF FLOWER GARDENS.

As soon as the frost has put a stop to vegetation, the flower garden demands attention, for many of the strong shrubs and herbaceous plants that spread from their roots, as well as other kinds that increase freely by seed, are very apt to overrun the more valuable plants which do not increase of themselves, and if unchecked would soon destroy that variety which is so desirable to have in small gardens. Much of the beauty and order of the flower garden depends on the preparations and disposals made at or soon after this time. Accordingly, measures should now be taken to improve the quality of the soil; the shape of the beds, too, may be altered, shrubs and herbaceous plants removed, and many other improvements made. These alterations are very necessary, for gardens that wear the same unvaried aspect, year after year, become wearisome.

A little trouble in interchanging the flower plants among the different beds, enlarging some and curtailing others, will accomplish all that is necessary. Those beds occupied this season with bedders may be filled with herbaceous or perennial shrubs and plants for the coming year. In this yearly change of the aspect of the garden lies half the pleasure of it to the cultivator. WM. C. L. DREW.

El Dorado Co., Cal.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

CLEMATIS APIFOLIA.

WHY is this charming climber so little known and employed? There is hardly anything blooming in the fall, as well adapted for covering piles of rock, old stumps or even for shutting up completely a wire or wooden lattice. Just now it is in its glory and will remain so until frost. It is astonishingly prolific of flowers and foliage, somewhat after the manner of Clematis Flammula only with different leaves and bloom. The former are of good size for a Clematis and curiously and deeply divided, a little like those of the Ampelopsis bipinnata. Their color is a bright green. The latter, that is, the flowers, are peculiar and very attractive. Covering the surface of the vine very thoroughly, the clusters consist of little white flowers with four small petals set at right angles with each other and surmounted by numerous anthers and a stigma, the greenish hue of which diffuses itself roundabout. Indeed the entire flower has a very slightly greenish hue which gives it an unusal appearance.

This Clematis is very vigorous and hardy, and merits better recognition. It comes from Japan and is not especially rare, though so little employed.

CLEMATIS GLOIRE-DE-ST-JULIEN.

This is another Clematis that shows finely in September. It belongs to the Lanuginosa type and flowered first two months since. Now, however, it is bearing a second set of flowers, almost, if not entirely, equal in size and number to those of the first crop. The white silk-like texture of the flower of this Clematis and its great size, six or seven inches in diamter, as well as this prolific season of second blooming, all combine to make it a most valuable climber for the fall. In growth, also, it shows more vigor than many of its near relatives. The extreme beauty and variety of this genus, or group, of climbers have yet to be properly appreciated in America. All who do learn their qualities express the greatest delight in their charms.

THE SUN-RAY PINE.

I like this name, suggested some time since by the RURAL NEW-YORKER. It is terse, Saxon, and expresses well the heart of gold possessed by the Pinus Massoniana variegata, as if abundant sunlight had suddenly taken up its abode in the greenest of Pines. Earlier in the season, the gold was more slightly and generally mingled with the green, sometimes even in a way that gave the impression of defective health. There is a marked limit of color fixed later in the season, that concentrates the green and gold, each within its own boundaries, by a well defined line. This distinct contrast intensifies the soft, rich glow which, coming as it does during the fall of the year, is specially charming. Pinus Massoniana variegata is from Japan and extremely rare, a prize that is eagerly sought for wherever it is known. The Japanese have a high regard for Pinus Massoniana and for all its varieties, which they have selected in myriads, and distorted and dwarfed in the peculiar manner by which their patient ingenuity evinces their regard. The Sun-ray Pine is, perhaps, the most favored variety of Pinus Massoniana with Japanese and Europeans alike. I know of no large specimens, but doubtless its habit is at least as fine as that of its parent, Massoniana, which is one of the very best species we have in cultivation.

THE GOLDEN-LEAVED CATALPA.

Catalpas are always fine in fall with their large, shadowy foliage, the nearest approach to the tropical size of palm leaves that we have, if we except Magnolia macrophylla. The leaves last well in autumn, retaining their normal coloring, which is, of course, finer on the new growth. Certain brighter changes of occasional young leaves have been perpetuated by grafting with a resultant new variety, Catalpa Syringæfolia aurea, which is never brighter than in September. It is bright gold, suffusing the green of the leaf and becoming conspicuous at some distance. There are other varieties of trees possessing much the same peculiarities, but none of more marked appearance at this season.

Flushing, L. I.

AMERICAN ARBOR-VITÆ.

Thuja occidentalis.

THE American Arbor-vitæ is one of our most valuable native trees for cultivation, for timber, ornament or protection. It is a species peculiar to this continent, having no counterpart in other parts of the known world. The Siberian Arbor-vitæ is but a dwarfed sport of the American, and is not found native in Siboria, or in any other part of the world, as one would suppose by its name.

The Arbor-vitæ is rarely seen native east of the great lakes, but abounds in the forests and swamps about Lake Superior and the northern portions of Lakes Huron and Michigan. It is usually a small tree, from four inches to one foot in diameter, but rising in the thick, native forests to a great hight. I have seen trees not more than eight inches at the base, rising sixty to eighty feet, one-half the hight a clean trunk, free from branches, and as straight as an arrow. It is not always a small tree, for forests in which trees are found two to three feet in diameter are common. Its timber is the most durable of any we have. Large quantities are annually exported from our northern forests, for fence posts, telegraph poles, and railroad ties; and these are called "cedar posts, cedar ties and cedar poles."

Although growing so tall and slim when thickly clustered, it forms a very dense beautiful tree when growing singly. Its side branches are numerous, short and stocky, gradually diminishing toward the top, forming a beautiful cone. Many suppose it to be identical with the White Cedar of the Eastern States, hence the name "cedar posts, &c." and the custom of calling its wild haunts "cedar swamps." Its principal peculiarity lies in the cones, which are composed of a great number of small scales imbricated, or overlaying each other, in a flat, fan-like form, looking as though they had been pressed into position. In the hands of a skilled gardener, it is one of the most useful trees for ornamental planting. As hardy and easily transplanted as a Willow, very patient under the shears, it can be easily trained into dense screens or barriers to ward off cold winds and storms, or for evergreen hedges for ornament and dividing off pleasure-grounds. For single trees, it is very beautiful and desirable, being easily molded by the shears into a variety of fanciful and fantastic forms. As it is so easily cultivated, so hardy, and so common, besides being so valuable, it is a wonder it is not more generally planted.

Door Co., Wis. GEORGE PINNEY.

Miscellaneous.

A NOTE FROM THE RURAL GROUNDS.

THE extensive preparations which we are making for our free seed distribution as well as sickness in the RURAL family, have prevented us from attending, as we had desired, to the promised Pelargonium present to our lady subscribers to whom alone the offer was made. It was our intention to require them to send stamps for the prepayment of postage. This will not now be required. We will send a few cuttings to applicants upon the receipt of their address plainly written. All applications *must* be received previous to Oct. 7.

A NEW PROCESS FOR SUGAR-MAKING.

WE are always anxious to give our readers the earliest information on all subjects likely to affect their welfare. There have been very few inventions, of recent date, more likely to do this than a new process for crystalizing sugar from corn-stalks and serghum, the discovery of which is claimed by F. L. Stewart, a chemist of Pennsylvania, and which has recently been successfully tested on a small scale by Professor Collier, chemist of the Agricultural Department at Washington. Professor Stewart claims to have discovered certain chemical preparations, by the use of which every farmer will be enabled to undertake the manufacture of sugar from his own corn-stalks and sorghum, without the large outlay necessary to produce sugar from sugar-cane. The nature of these chemicals, and the method in which they operate, are as yet secrets, and the inventor expects to derive his profits from the use of these articles, of which he has the monopoly.

The following is a condensed account of the process of making sugar by this new method:—

First—So soon as the juice has been pressed out of the corn-stalks or sorghum, heat it in a copper or tin-lined vessel to a temperature of 185° Fah., as shown by a thermometer, the bulb of which is immersed in the juice.

Second—When the juice has attained this temperature, stir into it a fluid ounce of lime to each gallon of juice, or from five to seven pints of the former to each hundred gallons of the latter.

Third—Then heat the whole rapidly to the boiling point.

Fourth—So soon as it begins to boil, if heated by steam, shut off the steam, or otherwise remove the juice from the fire, and when the sediment begins to settle, draw off with a siphon the clear liquid from the top until nine-tenths of the whole quantity of juice has been removed, leaving a thick, muddy sediment at the bottom.

Fifth—Place this sediment in a bag and add the liquid that filters from it through the bag to the clean liquid which has been siphoned off.

Sixth—The clear liquid which has been obtained by siphoning and filtering should be allowed to cool to 150° Fah. and then there should be added to it Solution B,—one of Professor Stewart's preparations—at the rate of one fluid ounce to a gallon of juice, or from five to seven pints to a hundred gallons. Enough of the solution should be added to neutralize the lime in the juice, and this point can be determined by dipping a piece of blue litmus paper into the juice, when if enough of the solution has been added, the color of the paper will change to red.

Seventh—The juice must be rapidly evaporated and skimmed frequently to remove any scum from the surface, while small quantities of Solution B. must be added, if the boiling juice will not turn the blue litmus paper red.

Eighth—When the boiling syrup has attained a temperature of 235° Fah., as shown by a thermometer immersed in it, it must be removed from the fire, and kept to crystallize in a room whose temperature should be about 80 Fah. To promote crystallization a few grains of granulated sugar may be added to the cooling syrup when it has reached a temperature of 100° Fah.

Should this discovery prove as efficacious on a large scale as it is reported to have done on a small one, it will be of vast importance to the agricultural community, and consequently to the nation at large. The subject is, therefore, one in regard to which the RURAL will keep its readers constantly informed of the latest developments.

TEA CULTURE.

VIEWS FROM AN ADEPT IN BRITISH INDIA.

WE have just received from Gen. Le Duc, Commissioner of Agriculture, a copy of a letter treating on the prospects of tea culture in this country and written to him, on July 14, by Mr. James L. Forbes, an extensive tea grower of Burlate Luckipere, Bengal. From it we make the following extracts for the benefit of those interested in this prospective branch of industry, and for the satisfaction of those numerous newspaper scribes who have been contemptously sconting the idea of the possibility of tea culture in the United States.

"As regards Tea cultivation in America, I believe from what I know of the country, and my experience as a tea planter that it only requires capital and enterprise to make tea manufacture one of the industries of America. There is no difficulty about the mere growing of tea. You have the climate, soil, rain-fall, and every thing favorable for the growth of the tea plant. The question is, can the produce be manufactured at a cost that will give profitable results? America has a great advantage over India and China in the possession of skilled labor and mechanical appliances. Machinery can be applied to all departments of the manufacture and is working here with success. My rolling machine is worked by a twelve-horse-power engine and rolls off from 600 to 800 pounds of green-leaf per hour. We also have curing and sorting machines, but the great difficulty is the want of skilled labor and intelligence on the part of the natives. There is also a vast field for improvement in the mechanical appliances we have; and I have no doubt but that the inventive genius of the Americans would soon perfect a machine that would solve the labor question of tea manufacture.

The only difficulty that remains is the one of cultivation and plucking. As regards the former, the plants could be planted in rows four by four that would give sixteen square feet for every plant and would admit of using the hand cultivators so common in the States. During my late visit to America I purchased one of Rue's hand cultivators and, with a slight alteration, I find that it works admirably As regards the plucking, I do not see my way quite so clear; every one hundred acres of full-bearing plants require fifty women or boys and girls, and that number would have to be employed during the months of June, July, August and September; half that number would do for April, May, October and November. We pay half a cent a pound for green leaf and the Coolies average from 35 to 40 pounds a day and a good plucker will bring in as much as eighty pounds in a day. This applies to large plantations, Burlate having six hundred acres under the plant. Two hundred of this is quite young: the yearly product is about 240,000 lbs. per week. I think as you suggest in your circular on the China Tea Plant (page 12) that small patches of tea cultivated by the farmers throughout the district with large central factories to purchase the leaf and prepare it for the markets, would solve the problem. As regards tea seed, we have the China, Assam, Indigenous and Hybrid. The China variety is much more prolific in seed than the other kinds, and, as seed checks leaf, the China is inferior in this as in other respects. The China is by far the hardier plant; it is much easier to rear and it will grow in widely differing climates, which the Indigenous will not do. The plants between China and Indigenous are called Hybrid and are acknowleged by all to be the best class of plants for tea manufacture both as regards yield and strength; six to eight hundred pounds of tea is the yield per acre from Hybrid plants, whereas the China yield only from three to four hundred pounds per acre. The infusion of tea from the Hybrid species is far more rasping and pungent than that of the China plant and the tea commands a much higher price and is used in the English market for mixing with the weak China teas to give them strength and flavor.

Had China never been introduced into India a very different state of things would have existed now. The cultivation would not have been so large, but far more valuable; all persons interested in the introduction of tea cultivation into the States, should profit by our experience and avoid the mistakes we made, and above all things select only the best class of Hybrid seed for the plantations. No one thinks of putting out China seed now, and in many cases planters have abandoned their China gardens for Hybrid ones.

WHAT OTHERS SAY.

A NORTH RIVER APPLE ORCHARD.—We have recently had an opportunity, says a writer in the N. Y. Times, of inspecting an orchard of about 30,000 trees, which is managed on business principles, is kept healthy, free from vermin, disease, and any approach even to those defects which detract so much from the appearance and usefulness of the orchard as generally seen. This orchard is situated on the banks of the Hudson River, between Hudson and Catskill, in Columbia County, and is owned by Mr. Richard McKinstry, who has been engaged for 21 years in bringing it to perfection. * * * * It is a business orchard, run on business principles, and by no means for show. Indeed, any one visiting the place in the expectation of seeing anything but a wealth of fruit, borne upon healthy, vigorous trees, brilliant in depth and warmth of color, and of unusual fairness in quality, will be disappointed. * * * A line over four miles long, or more than 2,600 apple trees, standing each ten feet apart, mark the boundaries; and within this there are vistas checkered by golden yellow, bright crimson, and emerald green along the sides, and lengthening out as one passes them, until closed in by a pyramid of beautiful color from the laden, drooping branches of a King, a Wagener, or a Baldwin. There are about 100 varieties of apples grown; but, like all wise and experienced pomologists, the owner is gradually reducing these varieties to not more than ten of the most profitable and popular ones.

There are 7,000 Greenings, 6,000 Baldwins, 4,000 Kings, nearly as many Wageners, (this apple has the merit of bearing every year,) 600 Northern Spy, 800 Red Astrachan, 700 of a choice native variety known as "Derrick's Graft" or "Richard's Graft," and almost as luscious at this season as a peach, and often measuring 13 inches around each specimen, with hundreds of Newtown Pippins and other favorite kinds. There are Pound Sweets that bear seven barrels to a tree, and Kings, of which only 60 can be packed into a barrel.

A great many of these apples are shipped to English markets, and are very popular there. It is hardly known to us as yet what a vast opening is there for our best fruits. A small export business has been done for many years, and American apples, chiefly Newtown Pippins, could be recognized in the fruit shops and markets by American travelers for thirty years or more; but since 1865 the shipments have greatly increased. In 1875, 70,000 barrels were sent abroad; the next year nearly 500,000 barrels were exported, and last year, which was a poor year, the exports reached nearly 100,000. But this market is the most exacting in the world; only the best quality of the best varieties, free from blemish, and put up and packed by skillful hands, are wanted or can be sold there; so that this opening can only be supplied by those who grow their fruit in the very best manner.

In addition to all these apples, there are 1,700 pear trees, of which 500 are Bartletts, some thousands of Cherries, among which are 1,000 Black Tartarian, 500 Governor Wood, and hundreds each of other valuable kinds. There are Peaches enough to make a decently large orchard of themselves, and, modestly hiding beneath the taller trees, are an immense number of red-currant bushes. The ground is plowed several times in the year, and when the wood growth promises to be excessive, the land is laid down to clover. That this management is successful is shown by the condition of the trees. It must not be supposed that the owner is free from the usual cares and troubles which beset mankind of the industrious sort; on the contrary, many men would have made firewood of their orchards had they less perseverance than Mr. McKinstry. One year over 8,000 trees, large and small, fell victims to the mice, and the disagreeable effect is still apparent in a large gap in the orchard not yet filled out. There are borers to pursue with wire, knife, gouge, and chisel; there are sun-scald and fungus to watch against; many trees are borne down with their loads, and crash into sad ruins. Storms may scatter the half-ripened harvest, and on the whole, "a heart bowed down with weight of woe" may very easily be found in a prosperous orchard as upon a farm where the bugs devour the potatoes and the sparrows carry off one's seed corn. The virtues of perseverance and patience, and a hopeful way of doing the best with things as they come to us, are certainly necessary to make a fruit-grower a happy man, if they are needed by any one.

SODA AND MILK.—"Jack reminded his mother that she had given him some tea instead of his usual allowance of bread and milk, and she explained that the milk was just on the turn from the hot weather, and so he could not have it. On Mr. Nicholson's suggestion, a few grains of carbonate of soda were added to some milk before it was boiled, and Jack's bread and milk was soon brought in as good as usual, much to the surprise of all.

'Well, Mrs. Forbes, that scores one for chemistry, anyhow.'

'Yes,' replied Mrs. Forbes, 'I must admit it does; so now, Mr. Nicholson, do please explain the matter.'

He did so by showing that fresh milk always contained some soda, but as the milk became changed some milk acid was formed, and this made a sort of flirtation with the soda, so that the soda could no longer do her proper work; but by putting some more soda into the milk, there was some one else provided to attend to the work, and thus the milk did not curdle.

'Very good,' said Mr. Forbes, 'but why cannot they do the same sort of thing with milk which is going to be sent away by railway.'

'So they do,' said Mr. Nicholson, 'and it saves a good deal of milk from being spoilt."—London Ag. Gazette.

BONE MEAL FOR SWINE.—The Indiana Farmer says that most farmers have noticed that in fattening swine, especially when they are crowded rapidly, they always appear weak in their hind legs, and sometimes lose the use of them entirely. An intelligent farmer says that he and his neighbors have made a practice of feeding bone meal in such cases, and find that a small quantity mixed with the daily feed will prevent any weakness, and strengthen the animals so as to admit of the most rapid forcing. As bone meal is known to be a preventive of crippled ail, and weakness in cows, it looks reasonable that it should also be a benefit to hogs, which are often confined to a diet containing but little or no bone-making material.

COAGULATION OF MILK.—The *Italia Agricola*, writing on the effect of thunderstorms on milk, states that it is a generally accepted belief that it is the lightning and electrical phenomena that accompany a thunderstorm, which cause the spontaneous coagulation of milk. Dr. Malhoern wished to test the idea, and for the purpose he filled a cylinder with freshly skimmed milk, and introduced into the same 100 centimeters cubes of pure oxygen, then allowing electrical sparks to pass into the apparatus for the space of 10 minutes, by means of the Rhumkorff machine, the effect being that the milk quickly coagulated, clearly proving that an acid reation had taken place, and after 20 minutes a firm cheese was produced.

CORN FODDER.—Where is the necessity of allowing corn to remain in shocks until the middle or end of November? asks the Germantown Telegraph. Corn should not be cut down until the stalks are dying and the grain is pretty hard, and then it should remain no longer in the field than is absolutely necessary for the drying of the grain. It should be husked as early as possible, and the fodder tied up in bundles, and either carefully stacked near the cattle stables or put under shelter in sheds.

SEEDLING SMALL FRUIT.—The Fruit Recorder says: To raise gooseberries, currants, or any other of the small fruit family from seed, make a low frame like a hot-bed frame, fill it up with rich earth to within a few inches of the top, and on this put about one inch of clear sand, and sow seed on this. Sprinkle sand over the seed, and keep it watered sufficiently to keep the surface just moist—*but not too wet.* In a few days the seed will germinate, and when plants get so large as to crowd, they may be transplanted.

CHERRIES.—The following is the list of cherries adopted by the editor of the Germantown Telegraph:—1. May Bigarreau; 2. Belle de Choisy; 3. Black Tartarian; 4. Black Eagle; 5. Black Hawk; 6. Elton; 7. Downer's Late; 8. Early Richmond; 9. Early Purple Guigne; 10. Del. Bleeding Heart. The ripening of the list will range from the earliest to the latest, thus carrying one through the whole cherry season. No one can go amiss in adopting this list.

ONLY TWO.—Professor H. Tanner, says: "The truth should be boldly acknowledged that for the attainment of a full success in agriculture there are two essentials—a thoroughly practical acquaintance with the business, and a previously cultivated mind, which shall enable the practice of farming to be more accurately and perfectly learnt."

NO YELLOW FEVER IN FLORIDA.—The Florida Agriculturist says, that in answer to several inquiries, it can assure those who wish to go there, that there has not been a case of yellow fever in Florida, and that the State has never been healthier than it is now. [We happen to know that this statement is correct.—EDS.]

MR. JOSIAH HOOPES, writing in the Weekly Tribune of "Hide-bound trees, says: "Like every other gardening operation, this too is liable to be overdone, but a slight cut merely through the outer layer of bark, when the tree is suffering, will bring relief, and so far as I have observed, does no evil.

CURRANT CUTTINGS.—Mr. Purdy says that currant cuttings should be taken off as soon as the leaf drops and burried a foot below the soil, in a sandy or dry place, with earth mixed all through them, and left there until early spring, when they can be taken up and set out in nursery rows.

Veterinary.

QUERIES ABOUT MALADIES OF STOCK.

ANSWERED BY D. E. SALMON, D. V. M.

Anon asks for some safe plan for removing from his horse's leg, just below the stifle, a hard bunch on the bone, caused by a kick.

ANS.—If the enlargement has been changed into bone, it will be impossible to remove it. If it still appears soft to the touch, a blister, consisting of one part cantharides to four of lard, may be applied with a probability of improvement.

J. C. Campbell, Licking Co., Ohio, says, I have a valuable cow; at intervals of two or three weeks one-quarter of her udder becomes swollen and it is with difficulty she can be milked. In twenty-four or thirty-six hours the swelling has disappeared, but at irregular intervals some other quarter will be affected. She is to all appearance healthy, has good pasture of timothy and clover, on dry, gravelly loam. What is the cause, and what will cure.

ANS.—The trouble is probably of a rheumatic nature. Would advise you to give one-half ounce of potassa and thirty drops tincture of aconite root, three times a day, commencing with the first appearance of an attack and continuing a week. If this is unsuccessful, you may add two drachms of chinoidine, or one ounce of tincture muriate of iron at a dose; or you may replace the nitrate of potassa with one drachm of colchicum. This disease sometimes readily yields to treatment, while in other cases it is very obstinate.

Industrial Societies.

QUEENS CO. (L. I.) FAIR.

The Queens Co. Agricultural Society should invest a part of its surplus funds in a brace of sprinkling-carts, abolish the trotting-track and extend its carriage accommodations. The fair would then be a model County Fair. As it is, it far surpasses in point of attendance and number of interesting exhibits, many State fairs. I had almost forgotten to animadvert on the execrable quality of the music; next to the dust, that brass-band was the most annoying feature of the fair.

There was a full representation in all departments, but the poultry was especially noteworthy as regards quality and numbers, surpassing in all respects the show at the New York and the New Jersey State fairs. The geese and ducks were excellent. Space precludes a detailed account of the birds, but we cannot forbear complimenting Messrs. Magrane & Fairservice, Newark, N. J.; Barr Bros, Bayshore; J. H. Perkins, Flushing, and N. W. Shutt, Brentwood, for their poultry.

The cattle were numerous and excellent, as was to be expected, considering the number of wealthy gentlemen on the Island who ride this hobby with increasing enthusiasm. Mr. Crozier was conspicuous by the absence of his usual fine herd, but Beacon Farm was represented by a herd of Holsteins,—a new departure in that quarter. One cow, Katenka, averaged 30 pounds of milk per day for 359 days. Certainly a handsome record. I noticed a number of fine grade cows—T. Treadwell, of Mineola, and Joseph L. Townsend, of Old Westbury, taking honors in this class. B. S. Swan, Oyster Bay, had his usual high-class Jerseys, and W. P. Douglass, Little Neck, competed on even terms with the same breed. W. Willetts, Roslyn, seems to be the only breeder of Devons—more's the pity, as these serviceable animals do not seem to be held in proper estimation.

Wm. Kloenne, of Hicksville, had expended no end of trouble and soap on his Angora goats, and they repaid the trouble by appropriating a large share of the visitors' attention. Thos. Mott, Port Washington, and D. Brinkerhoff & Son, Manhasset, were strong in Southdowns, while S. L. Albertson, Roslyn, and W. A. Willis, Mineola, monopolized the long-wools. W. H. Bowker & Co., and the Mapes' Formula & Guano Co. had the fertilizers all to themselves. The former had their samples tastefully arranged in glass jars and bottles, and the latter had a crescent-shaped exhibit. One side showed their complete manures in bags, just as they leave the factory, and the opposite row of sacks contained the crude materials from which the manures are compounded, thus showing at a glance just how the ingredients are combined.

R. H. Allen & Co., and A. B. Cohu, had agricultural implements in great variety. Philips's Spiral Corn-husker was in operation, worked by Minard Hardor's, "Fearless," horse-power. The Eureka Mower, Foust's Hay Loader, Noyes' Hay Carrier, the Champion and Centennial Drills, Deere's Gang Plow, and Corn Cultivator, as well as other implements of established reputation, were represented. The Dairy Supply Co. had their Monitor Churn, Cooley's Apparatus, and a new Milk Pail on exhibition, and, to make things interesting, entered into a churning contest.

The floricultural display was very generally confined to cut flowers, and horticulture ranged from apples to hot-house lemons and pine-apples. The grapes and apples were noteworthy. The mammoth pumpkins, turnips and beets were out in force, flanked by an appetizing collection of bread and cake, the pride of premium housewives. A tether, shown by Mr. Rook of Glen's Head, was one of the novelties of the Fair, and well worthy the attention it received.

The arrangements of the exhibits, and the thorough way in which the officers of the Society discharged their onerous duties, lent a completeness to the occasion that all will remember with pleasure. R.

THE MONTREAL HORTICULTURAL SHOW.

The "Montreal Horticultural Society and Fruit Growers' Association of the Province of Quebec"—a pretty long title!—held their annual exhibition at the Victoria Skating Rink in Montreal, Sept. 17, 18 and 19. Your correspondent had the pleasure of being present during each day of the show, and can testify to its entire success, both as an exposition of fruit, vegetables, flowers and ornamental plants, and also financially, the attendance being very full, both day and evening. This society is an example of what can be done by energy and skill on the part of its managers, and especially of its Secretary, Henry S. Evans, Esq., whose untiring zeal has been effective in placing the Montreal Society in the front rank among American societies of its class. The membership is, I believe, over 700, and all classes, from the cottage gardener to the wealthiest citizen, take active part and deep personal interest in the success of its meetings and exhibitions.

The display of floral treasures, both pot-plants and cut flowers, was simply immense, the great building being transformed into an enormous conservatory, in which every person's best was collected together to constitute a sight rarely to be seen. The labor and skill thus represented can hardly be estimated. Montreal and its outlying villages contain a great number of wealthy people, who themselves, as amateurs, and whose skilled gardeners, together, are able to present as great attractions in this line as any city on the continent. There were, in addition, many fine contributions from Quebec and other places within the province at a distance from Montreal, which, altogether, produced such a *tout ensemble* as is rarely equaled and still more rarely, if ever, surpassed.

The show of hot-house grapes was especially fair and extensive. Peaches, Nectarines, and other orchard-house products were shown, while plums and pears were in abundance and the show of apples profuse.

This latter portion of the exhibition was the one most interesting to the writer, as displaying the degree of success that may be reached in orcharding, even in so cold a climate as that of Lower Canada. This is obtained, and is being developed and advanced in a most gratifying degree, by the diffusion of varieties of which almost nothing is known elsewhere. Excepting the Fameuse, itself a Canadian apple, hardly a variety exhibited at this great show of apples, is cultivated or known outside of the province. I am convinced that this is a great loss to our fruit-growers, especially to amateurs, for many of these Canadian apples excel, both in beauty and spicy piquancy of flavor and aroma, any sorts in common cultivation in the States. It may be that they would not preserve all their excellence when transferred to a warmer climate, but at least they would prove treasures in those colder sections of the Union, such as northern Maine, New Hampshire and Vermont, Wisconsin and Minnesota, where good apples are scarce and all the standard varieties refuse to grow.

The county exhibits of apples were especially interesting, as showing the relative hardiness of different varieties, displayed by their presence or absence from the tables of each county. The county of Huntingdon, lying at the extreme western corner of the province, between New York and the St. Lawrence River, showed its milder climate by the exhibition of apples like the Baldwin and Rhode Island Greening; while the show of the Abbottsford Fruit-growers' Association from the County of Trowville (which took the second prize, Huntingdon getting the first), demonstrated what can be done by skill in the choice of the right varieties where even the Fameuse is not entirely hardy.

I will close this brief notice of a most noteworthy exhibition by naming the varieties of apples exhibited which have proved the hardiest, most productive, and of the highest quality. For summer apples there were the Blinkbonny, the Peach of Montreal, and the Roseau. For autumn, the Alexander, the Cellini, the Hawthornden, the King of the Pippins, the St. Lawrence, the Fameuse Sucre, the Mountain Beet, the Autumn Strawberry, the Bourassa and the Docarie. For winter, the Famense, Canada Baldwin, White Winter Calville, Pomme Grise.

It should be noted that though the names of some of these, as the Cellini, the King of the Pippins and the White Winter Calville, are found in our works on pomology, yet competent authorities, Mr. Downing among them, decide that the Canada apples thus named are not the same. Of others, and these among the choicest, and only lately brought to notice through the efforts of this society—the Fameuse Sucre, Mountain Beet and Decarie—it should also be said that they have not yet been propagated by nurserymen to any great extent. The Pomme Grise and Alexander, named above, are the same as grown elsewhere.

T. H. Hoskins, M. D.

Orleans Co., Vt., Sept. 21.

NOTES AT THE N. Y. HORT. SOCIETY.

Mr. Thomas Hogg sent a Chestnut from Japan, some years ago, which is now being propagated by the Kissena Nurseries of Flushing, L. I. One specimen is here exhibited, five feet high, bearing a dozen burs or cupules. The leaf is much smaller than our Chestnut and narrower. It is not more than six years old—is perfectly hardy. The seed is much larger than our Chestnut, though we know not as to the flavor. But the size of the Chestnut, and its early coming in fruit, must render it a valuable acquisition.

The vegetable and fruit display of this well-conducted exhibition is alone worth a visit.

Ellwanger & Barry take a silver medal for Grapes beside the exhibit of Mr. Ricketts—while Mr. Ricketts takes a gold medal for pears, beside the display of E. & B., which is somewhat reversing the usual order. Peter Henderson takes a silver medal for best collection of cut flowers.

In a large glass case we find bundles of Champlain and Defiance Wheat—the size and beauty of which make one envious of those who raised it. Whatever these varieties may ultimately prove to the spring wheat cultivator at large, these specimens are at least remarkable.

The floricultural display is arranged with exceeding taste—the plants are choice, and the entire exhibition, to say in a word what we should like to devote a page to, is of rare merit.

Rochester, N. Y., Sept. 26, 1878.

At our recent western New York Fair, which by-the-by has been a great success, I was interested more particularly in Floral Hall than in other departments. Here the display of exotic plants was unusually fine. Messrs. Ellwanger & Barry, J. Charlton, and J. B. Keller, deserve great credit for their large and varied collections. The display of fruits, though good, was not superior to that of other years. Among the novelties exhibited I noted the Early Dawn, a new early, black grape, being propagated by H. E. Hooker, but which is not yet put on the market. The bunches were medium in size, handsome, berry small and of excellent quality.

The Monroe, a new grape exhibited by Ellwanger & Barry; very compact bunch, handsome appearance and fine quality.

The Pocklington, a green grape from Sandy Hill, N. Y.; the finest of its class exhibited, and if we may believe of it one-half that is claimed, it is certainly the greatest acquisition that horticulture has had for years. In other departments the entries were full—there being some 3,500 entries, all told.

Stock was fairly represented; some very fine animals being present. Among farm implements worthy of notice I would mention the new harness for plowing orchards, which does away with traces and whiffletrees; and by the use of which the most careless person is competent to plow in young orchards without danger of barking the trees. Of other time and labor-saving machines, time will not permit an account.

H. T. J.

The Somerset County Fair at Somerville, N. J. will be held on Tuesday, Wednesday and Thursday, Oct. 1st, 2d and 3d. This old-established institution is yearly growing more and more popular, and this year the inducements are greater than ever. Excursion tickets will be sold by the railroads at reduced rates. W. S. Potter, Secretary.

The Poultry Yard.

PROFIT COMBINED WITH AMUSEMENT

In a poultry establishment the ornamental can be adopted with the useful, and profit can accompany the pleasure and recreation of attending to fowls, but silly people imagine, because some gentle-people have fine poultry houses with compartments for various kinds all under one roof and have yards attached to prevent the fowls roaming in their ill-fenced gardens or their exposed pleasure-grounds, &c., that they can shut up fowls and continue to keep them in confinement so as to make them pay for feeding and attendance. By having unlimited range, fowls can easily be made profitable; for they will pick up at least half a living, and they do not then require one-tenth as much attention as those kept in a yard which always has a bad oder, however often it is cleaned.

It is extraordinary to find there are men so weak as to attempt to keep great numbers of fowls together with limited range when, time after time, the folly of all attempts of the kind has been demonstrated. But although no sensible business man will again confine hundreds of fowls in any inadequate space, yet great numbers can be kept on one farm and profit be combined with amusement by making tasty ornamental little roosts, and placing them at such distances apart as to prevent any intermixing. These roosts might be made and painted so as to have the appearance of miniature cottages, and so placed about an estate as to be exceedingly picturesque.

I have in mind at the present moment an island, the property of one proprietor, whose residence stands on an elevated position commanding a view of the whole, with the exception of portions hidden by trees. What a very pretty effect some of these poultry houses would have if interspersed among laborers' cottages and other buildings used as shelter for farm stock, and these also could be made to have such an appearance as would be in unison with the erections all over the island. Imagine a farm neither round nor square but tolerably compact, with a hundred or more roosts, sheds for cattle and for sheep to resort to in stormy weather, and here and there interminglod with these, a cottage prettily adorned with vines, and a handsomely laid-out garden. Then suppose the whole painted alike and, as near as usefulness combined with the ornamental and uniformity will permit, all showing doors and windows and all having ivy or vines of some kind running about or trained around them, so as to give the best effect. If an island, all the outside poultry houses might be for water-fowls and, sweeping down from the mansion, might be a well kept beautiful carriage road which could take a circuit of the farm so arranged that it would be a delightful pleasure drive, and at the same time it could be used to go round to the different buildings which would be on the right and left all the way along.

Profit could all the while be combined with the ornamental and the useful, and good fine square fields could be arranged so that they would not interfere with the buildings or any of these structures or impede cultivation. If wealthy people, when they retire from cities to the country, would first of all lay out their farms so as to have them one beautiful scene of variety with perfect utility, how ornamental would not the arrangement be to the country!

An Old Hand.

The Vineyard.

GRAPE LEAVES.—No. 1.

W. C. BELLAMY.

Omitting, in this communication, any reference to the undeveloped resources of the South, in mines, minerals, water power, and other natural advantages, I give here a few practical hints on Grape Culture.

It is a lamentable fact that, although a large proportion of the South is as well adapted to the growth of the Grape as the sunny slopes of the vine-clad hills of France and Spain, there are but few localities south of the Ohio River, except in California, where grape culture has been conducted to any extent and with any degree of success or profit. Hundreds of vineyards have been planted in the South, and, after several years, plowed up, the land planted in cotton, and the "ipse dixit" of the ruined owners added to confirm the generally received, but grossly erroneous verdict, that Grapes can not be successfully raised in the South. But because some—yea, even most who have tried it—have failed, it does not follow necessarily that all will fail. We must take into account those who *have* succeeded as well as those who *have not*—and "*quod homo fecit, homo faciat*,"—"What a man has done, a man may do"—and if a man can have fifty vines bearing good fruit, why may he not have fifty thousand? The failure has not been from defects in climate or soil, nor perhaps, in most cases, for want of proper care, but from errors in selecting the varieties, and also, to a great extent, from the lack of a proper study of the wants and habits of the vine.

The varieties of the Grape are almost innumerable, and, while one might do well in a certain locality, another would as certainly fail. Experience alone can teach what particular Grape will suit a given locality. Longworth's success with the Catawba, in his singularly fortunate locality on the Ohio, created, some years ago, a perfect furor in the South, and many—believing if Longworth could succeed with the Catawba they could—planted large vineyards, and waited anxiously and patiently several years to gather, instead of a rich vintage of generous wine, only their utter pecuniary ruin. I instance one man who planted thirty thousand Catawba vines, who, after waiting several years for his profits, was sold out of house and home and vineyard by the sheriff, while his vine-dresser, who had received but small wages, is now possessed of a portion of the same land—has it planted in a variety suited to the locality, and is realizing handsome profits from the sale of grapes and wine.

It is a matter of wonder that our people should be so blind to the munificent gifts of a benevolent Creator, and waste their time and substance in pursuit of what they can never attain. I refer to the fact that the South abounds in native Grapes, some of which can not be excelled either for table use or for wine. Perhaps our very best is the Scuppernong, first discovered, growing wild, on Scuppernong River, North Carolina—whence its name—and it is not known to exist much north of that locality. Both the fruit and its peculiar flavor are truly *sui generis*—but it is so universally distributed over the entire South, I will not (unless your *Northern* readers desire it) describe it, except to remark that aside from its color—a brownish yellow—and its fine wine-making properties, it possesses a peculiar and most delightful fragrance—delicate and yet so diffusible that a pint of the fruit will emit a delicious perfume throughout the whole of a large apartment, and a basket in which they have been gathered will retain their odor for weeks afterwards, like Moore's "Vase in which roses have once been distilled."

The seedling of the Scuppernong is invariably a perfectly black grape, and a *coarser edition* of its parent in every thing except in that peculiar, lasting odor and wine-making properties—and is known by the several names of "Bullace," "Muscadine," etc.—the origin of which I can not give. In this last respect, it makes a wine in every respect equal to the parent grape, and by many considered far superior. Its wine is a deep purple, while that of the Scuppernong is a rich clear amber. This seedling has been so disseminated that, except in the pine barrens, one can hardly ride a mile in any direction without seeing them in every jungle, on every hillside, gracefully festooning the forest trees,

and, in favorable situations, climbing to, and taking entire possession of the tops of the tallest trees, producing in their rich luxuriance a wild, weird and picturesque effect.

Fruiting in three or four years from a layer, it increases in fecundity with its age—is wonderfully prolific and subject to no disaster, never failing to bear good crops annually, blooms late, and consequently is not liable to injury by late frosts, and ripens its fruit in September, rendering the whole atmosphere around fragrant.

Catherine Co., Ala.

The Querist.

ANSWERS TO CORRESPONDENTS.

Sorghum Sugar Making.

C. J. Reynolds, Steuben Co., N. Y., asks how to manufacture sugar from the hybrid sorghum cane. He planted some at the same time he planted field corn, and both ripened nearly together. He wishes to learn the percentage of sugar it contains, etc.

ANS.—Sorghum saccharatum thrives best on rich land deeply plowed. Calcarious soils furnish the best syrup. It does not flourish on soils abounding in black muck, on soils standing over cold, wet sub-soils, upon undrained lands, or in soils rich in soluble saline matters. Well ripened stalks yield about half their weight in juice, of which from five to ten gallons are required for a gallon of syrup. The saccharine matter, after being evaporated, is mainly in the form of glucose, and produces only a very small percentage of crystalized sugar, so that the plant is cultivated chiefly for the syrup. A fair average yield is about 150 gallons to the acre. The syrup varies greatly in quality, according to the care and skill bestowed upon its manufacture, from a dark greenish-brown fluid, with an unpleasant, weedy flavor, to an amber-colored saccharine syrup, destitute of any characteristic flavor.

The process of manufacture is very simple. Before the seeds are fully ripe, the leaves of the plant are stripped off, from two and a half to three feet cut off the top, the stems cut six or eight inches above the ground, and brought to mill where the juice is extracted. The juice may be extracted by several methods; it is generally effected by pressure, for which purpose machinery may be used similar to that used in the South for the pressure of the sugar-cane.

This consists of three horizontal rollers, two below and the third above. The cane is carried by an endless feeder, and passes downward between the upper roller and the first lower, then upward between the upper and second side-roller, thus being squeezed twice.

The cost of an outfit, for the manufacture of syrup from the plants of 40 acres, is about as follows:

1.2-horse vertical mill	$100
3 Evaporators	80
Brick, etc., for furnaces	30
Skimmers, etc	30
Total	$240

The stalks yield about 65 to 70 per cent. of juice. According to Dr. C. A. Goessmann (*Trans. N. Y. State Ag. Soc.* 1861), the fresh cane has the following composition:

Water	78.94
Sugar	9.25
Gum, salts and other soluble matter	0.97
Albuminous matter	1.40
Cerosine (wax) and insoluble earthy compounds	1.24
Cellulose	8.20
Total	100.00

The leaves contain of dry matter, 73 per cent., water, 27 per cent.; 100 pounds of fresh leaves are equivalent as food for cattle to 80 or 85 pounds of hay.

The albuminous compounds have the power of converting the cane sugar into glucose, which is uncrystallizable, and again to resolve the glucose into alcohol and carbonic anhydride.

The fresh juice is greenish-yellow, and exhibits a slight acid reaction. On standing, it deposits a voluminous, slimy sediment, consisting of torn cells, chlorophyl, wax, etc.

According to Goessmann, the composition of the juice is as follows:

Cane-sugar	9.950
Gum, albumen, etc	1.510
Acids	Not determined.
Ash	0.309
Water	88.231
Total	100.000

The juice is neutralized by slacked lime, and boiled in evaporators with constant skimming to a density of 18° Baume. It is then drawn off into a tank and allowed to deposit suspended impurities, and then introduced into a second evaporator and boiled down to from 35° to 40° B.

If the herbaceous flavor has not disappeared, a fresh addition of slacked lime is made and boiling repeated. The yield of syrup may vary from 60 to 180 gallons per acre.

[In our answer to *H. C. Smith*, on page 442, we said that his specimen of the gigantic Rhinoceros Beetle—Dynastes tityus—if sound, might bring five cents. We should have said that, in its damaged condition, it might bring that price. A perfect specimen is worth considerably more to a collector of beetles who has none.—EDS.]

Choice Roses.

C. J. S., Fowler, St. Lawrence Co., N. Y., asks, 1, whether there is a white Rose or one of any color that will stand the winter there and blossom monthly during the summer; 2, also which two varieties of Roses are the most desirable for winter-blooming.

ANS.—The only winter-blooming Rose that is hardy here is La France. Whether it would be equally hardy in St. Lawrence Co. is doubtful. The best white Rose, Madame Plantin, blooms only in June. A good Remontant, blooming two or three times in the season, is Madame Gustave Bonnett.

Miscellaneous.

T. G., Naples, N. Y., asks (1). Whether there are in this country any establishments for dying silk skeins, and if so, is the operation performed by hand or machine. (2). How will apple and pear tree cuttings have to be handled to insure success in making them strike root? (3). When should these cuttings be made? (4). Have they to be preserved in dry sand wholly, or partly? (5). Which variety of pear brings the highest market price.

ANS.—(1). It is the practice of some dyers in this country to dye silk skeins by hand and wring them out by machine. We would refer to Jacob New, 448 Broome St., of this city, for full particulars of his practice, and that of the large factories in Paterson, N. J.

(2). Make cuttings the same as from any other plants and strike them in sand.

(3). Now, if you have bottom heat—in the spring if you have not.

(4). The cuttings may be made in the spring.

(5). Bartlett, in its season.

G. P., Sturgeon Bay, Wis., asks (1.) Will Jerusalem Artichoke succeed as far north as Green Bay, Wis., latitude 45°? Our winters are usually very severe, but the ground is well covered with snow. We do not raise corn, except the earlier varieties. Our seasons are too short and cool. (2). Would the tubers of the Artichoke winter safely in the ground? (3). When and (4). how should they be planted? (5). Where can seed be obtained?

ANS.—(1). Yes. (2). Yes. (3). As early as the ground can be worked. (4). Plant in rows three or four feet apart and two feet apart in the row. (5). Of any prominent seedsmen of Chicago or New York.

G. N. P., Akron, O., asks how and at what season he can straighten the leader of a young Weeping Spruce which is bent over towards the ground.

ANS.—It ought to have been straightened in the summer of the first year of its growth. We know of no other way than by placing a stake behind it and, by a thick cord, drawing it up gradually. Or, the buds of this leader may be rubbed off so as to induce another to start, leaving the first to form a part of the body of the tree.

A. L. S., Queens Co., L. I., says:—"You have said that the Thwack Raspberry is among the promising new varieties. In a late RURAL you say that Mr. Ree denounces it as a weed. I should like to know which to believe.

ANS.—The RURAL of next week will have much to say respecting Raspberries. We shall tell all we know of the Thwack.

D. Foote, Geneva, Ohio, asks for the names of the best works on the care and culture of fruit both large and small.

ANS.—Barry's Fruit Garden, $2 50; Thomas' Amer. Fruit Culturist, $3.75. For small fruit, Fuller's, $1.50. All to be had at this office.

RURAL SPECIAL REPORTS.

Alachua Co., Fla., Sept. 20, 1878.

WHY do not some of the well-to-do, yet consumptive, asthmatic, or bronchitic readers come to this section of Florida—South and West Alachua County—and engage in sheep-raising? Why go to the wilds of the far West, upon barren wastes lacking water and fuel, braving the wintry cold, the wolves and Indians, when here, only a few miles from a railroad, are extensive prairies covered with rich grasses, well watered, plenty of timber, cheap labor, and in a climate unapproachable in America or elsewhere. With but little expense, sheep may be kept here. They need no shelter, and, doubling in numbers frequently every second year, they soon become a source of revenue. One gentleman in twelve years raised 1,400 from the small beginning of ten, and that with very slight attention, and he told me that he has never seen the least sign of scab, rot or other disease.

Let us compare our climate, 29° north, and that of Australia, 28° South, and all will admit that Australia is the greatest sheep country of the world. I would refer the reader to Department of Agriculture's Report for 1864, pp. 204-223. In Australia we find: Price of land, $5 to $50 per acre. Cost of herder $200 per annum. Cost of rations, $130 per annum. Yield of wool, three to five pounds per sheep. Nine months of dry season, and range of temperature, 100° to 120°. The land an arid, treeless plain, brackish water, often only obtainable by expensive wells, costing over $1,000 each, and so little grass that "the piny barrens of the North are gardens in comparison," and "sheep are compelled to subsist for weeks and months on the remains of the parched up grass."

Land here rates from $1.25 to $2.50 per acre. Herders $150 per annum. Rations $50 per annum. Yield of wool, two shearings, four to ten pounds per sheep. Lands heavily timbered, well-watered, and permanent grasses. All the facts and reasons for sheep-raising so ably given by the Commissioner of Agriculture of Georgia, apply with equal or even greater force to Florida, as our climate is superior. If a permanent pasture is wanted, Bermuda-grass, at a trifling cost, will soon supply it, and so will peas. Florida clover and turnips make an agreeable change. If fat sheep are required, a few bushels of cotton-seed can be used. No expensive sheds, racks or barns are ever needed. We are only a few days from the metropolis, and freights by rail and water are quite low.

Medical and ailing readers are interested in the healthfulness of this region, and when I say that I can conceive of no place where medication is less needed, they may perhaps understand its salubrity. The winters are dry, the temperature from 45° to 70°. The summers, during June, July, August and September, have almost daily showers, and the day temperature ranges from 75° to 95°; night temperature from 65° to 75°, and there is a constant sea or Gulf breeze. The barometric pressure is peculiarly stable. There are often days or even weeks during which the variation will not reach 3-10 inch of mercury. This fact renders this region particularly suitable for asthmatic, bronchitic or hemorrhagic invalids. Let the invalid try the sheep industry on some of our beautiful prairies, living mostly out-of-doors, enjoying the 240 clear days of our year, inhaling the warm sea-breeze, and the pure air. These, together with sunlight, even temperature and air-pressure, will bring the boon of health and a certain income from his flock.

The wonder is, how sadly neglected this pleasant branch of industry has been.

JAS. C. NEAL, M. D.

MIDDLEBURY, Vt., Sept. 23, 1878.

ALTOGETHER we have had a singular season. First, the spring was cold and dry and backward; then, extremely wet, till the hay crop was assured; then, severe drought till the eclipse of the sun; then, rain and thunder almost incessantly, till within a short time back; and now, as delightfully dry weather as any one could ask for. Hay crop heavy; potatoes almost a failure, early ones rotting badly on moist land; corn a medium crop, and is ripening off nicely; wheat and oats pretty fair, especially winter wheat; fall feed never better. Apples plentiful; in short, we have much cause for gratitude for a bountiful harvest; and while many places have been devastated by severe storms, we have been spared—not even a hail-storm of any severity having visited us just here. Severe frost this morning—the first one here this fall. M. H. A.

DOOR CO., WIS., Sept. 21, 1878.

THE season has been unusually dry until recently. Wheat, oats and barley are not yielding more than half the usual crop. Potatoes are almost a failure. They are worth now 85c. in market. Corn was never better. Fruit is grown only on a small scale, but the crop of apples is good. Winter wheat was much better this season than usual, and in consequence, a larger breadth than usual is being sown. A very wet spring gave us a good hay crop, and recent rains give promise of an abundance of fall feed.

G. P.

ATHENS CO., Ohio, Sept. 24th, 1878.

THE hay crop in this county is good and has been saved in fine condition. Of peaches and plums there is an immense crop. Apples are falling and rotting badly. Wheat is above an average in quality. Corn will be a short crop, especially in hills. It was badly injured by the storm of the 12th and the previous night. At least six inches of water fell within twenty-four hours. DAVID PUTNAM.

ARGYLE, Washington Co., N. Y., Sept. 18.

I FEAR that the failure of the potato crop in this section will cause a scarcity of money during the coming winter, as farmers now are poorer hereabouts than I have ever seen them. The white worms have done more damage than the potato bug. J. J. McN.

NAPLES, Scott Co., Ill., Sept. 27, 1878.

OUR crops here were very good with the exception of corn and late potatoes. Wheat averaged about 25 bushels per acre and hay about two and a half to three tons. Whoat-sowing is progressing rapidly, some sown the first of this month, is already looking green. E. M.

Industrial Implements.

THE PACIFIC RURAL PRESS has been piqued by the inefficient buzz of a puny railroad journal, the Railway Age, that assumes to shed a glimmering light on the subject of plows. The Age says: "The largest plow in the world, singularly enough, is one just built, not for a "large farmer" but for the granger's *bete noir*, a railway company. The Chicago, Milwaukee and St. Paul has ordered it to use in ditching for railway construction in Iowa, and it is to be drawn neither by horse, ox nor mule, but by a locomotive. The dimensions of this steam-pulled ditcher are given as follows: The share weighs 382 pounds, the mold-board, 180 pounds; the beam, 900 pounds; the coulter and clasp, 180 pounds; the clevis, 60 pounds; the standard, 134 pounds. The sizes of the principal parts are: Beam, 16½ feet long, 10 inches wide, and 19 inches thick; land slide, 9 feet by 5x2 inches, standard, 40 inches by 7x1½ inches; mold board, 8 feet by 26 inches; share, 5½ feet by 12 inches. It will cut a furrow 37 inches wide.

And is handsomely taken up by the Press as follows:

"This puny, one locomotive implement is then put forth as "the largest plow in the world," and the agriculture of the country seems to have kneeled in silent acquiescence in the railroad's claim! We have waited in the hope that California prowess would not be needed to crush such a tiny upstart, but if the rest of the country holds its peace, California does not. The fact is that California agriculture can so far overlie this mooted monster in the plow line, that if the Iowa plow should fall into the California furrow, they would have to get a lantern to find it with.

A few years ago a plow was built on the Livermore ranch in Kern County, according to the design and under the supervision of Mr. W. H. Souther, which, if it should meet this Iowa plow, it would serve it as a locomotive might a handcar. It is called the "Great Western," and these are its weights and measurements: Beam, 18 feet long, 18 inches deep, and 10 inches thick; landslide, 17 feet long, 5 inches wide, and 1 and 1½ inches thick; standard, 3 feet high; mold board, 12 feet long, and 3 feet high. This plow weighs one ton, and is swung by a heavily ironed wooden arch, between two wheels eight feet in diameter, and with tires six inches wide. The attaching of the body of the plow to this arched axle of the wheels is accomplished by running two heavy fenders back from the arch, and fastening them to the back ends of the beam and mold board. A 14-foot lever runs from the mold board across the back end of the beam, and on this a man stands to adjust the plow as to depth of cut, etc. The "Great Western" cuts a furrow four feet wide, and three feet deep, and is drawn by 80 oxen, yoked to a wire cable one inch thick. This cable weighs 1,140 pounds.

There follows the plow an A shaped scraper, drawn by a chain from its apex by 80 mules. It is 12 feet wide, and 3 feet high at the open end. The sides are heavy iron. This, following the plow, shoves the furrow out 10 feet from the place where it is left by the plow.

With the 'Great Western' and its scraping follower, the Kern Island canal and many of its branches or sub-canals were built in one quarter the time in which it could be done with any other machine now in use, and for a much less sum of money.

Such are the facts in brief, for we have not aimed to describe the machinery in full. The lesson which our Chicago contemporary should draw, is the beauty of speaking with becoming modesty, and when an Iowa railroad constructs a little cultivator to scratch along the sides of its tracks, do not again call it "the largest plow in the world."

A WORKSHOP is as indispensable on a farm as a repair shop is to a railroad. Tools and farm machinery are constantly breaking and getting out of repair. How often do we hear the farmer say, as he hitches up his team to go to town, perhaps some five or ten miles distant, for some trifling job either to the carpenter or more likely to the blacksmith, "If I only had the tools, I could fix this myself in a few minutes."

The Empire Portable Forge Co., Cohoes, N.Y., has perfected a forge designed especially for farm use. It is guaranteed to weld three-inch iron, and as it has no belts or bellows, and is made of iron and brass entirely, it must be very durable. This company now offers the farmer, at small cost, just the "kit of tools" he most needs to keep up his repairs. The illustrated catalogue is sent free to applicants.

THE Towanda Eureka Mower Co. has sold to Knapp, Stout & Co., Menominee, Wis., thirty-one of their six-foot Eureka mowers for use on their farm. This firm is one of the largest farmers of the north-west, and this sale is a solid recognition of the merits of the Eureka, and a pleasant introduction to north-western territory.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY OCT. 5, 1878.

NEXT week's RURAL will give much space to the Raspberry; in a week or so thereafter we shall give special consideration to hardy Grapes: then in a week or so to the Apple, Pear etc. Original engravings will be presented in each issue. We mention it so that any of our readers may communicate the results of their experience, if so disposed. We are also preparing several articles upon Millet in general and upon "Pearl Millet" in particular, which we believe will prove, as forage plants, of great value to the farmer.

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

AFTER-CULTURE OF WHEAT.

The practice of using the drill and the cultivator in growing the wheat crop, is evidently and rapidly winning the approval of practical men, as it may with good reason, for it has all the previous presumptions clearly in its favor, as well as the analogy of other crops, and is also sustained by the conclusions of science, and the testimony of advanced farmers. There is so much to be said in favor of this plan, that every wheat grower in the country ought at least to give it a fair trial.

It is recommended not merely by the saving of seed, and the uniform depth of planting secured by the drill, (which is a great security against freezing out,) but equally by the trifling cost of cultivation, as compared with the result, and by the surprising increase of yield, when the process is rightly managed.

In all the trials of this plan that have come to our knowledge, we have heard of but one that did not succeed, and in that case a better result is confidently expected at the next trial. In truth, the only surprise is, that a mode of culture so evidently sound, and so decidedly profitable as this has thus far proved to be, should have been so long neglected. If the extermination of weeds, and the development of latent fertility by pulverizing and aerating the soil are found, as a general rule, both useful and necessary in promoting the yield of crops, then so much the more are they needed in the case of this cereal, not only on account of its vast importance, but from the fact of its serious decline in recent years over large areas of country.

Here then we have, within easy reach, one of the most reliable means of reviving and restoring to its ancient affluence, a crop which though of great value and national importance, is, in some sections of the country, gradually disappearing from our husbandry, in consequence of inexcusable neglect. A process that is found to increase the yield of a great national food staple from fifty to one hundred per cent, at a cost of five or six dollars per acre, is not a matter to be overlooked by intelligent farmers, and there is no reason why this method of treatment for wheat, should not be universally adopted before the close of another decade, if not even at the beginning. This method is largely practiced in England, and their average yearly product is more than double our own. In this country some enterprising farmers have already reached results quite equal to those of our English cousins, and which, when compared with our general average, are simply amazing, and quite sufficient to prove the necessity of abandoning the old method.

Mr. J. M. Heiges, of York County, Pa., who was a successful wheat grower, even by the ordinary method, found by repeated trials that the yield could be increased by hoeing from twenty-three bushels per acre, to fifty-five bushels, and in one case, by judicious manuring, he reached a product of seventy-one bushels.

L. W. Groff, of Lancaster Co., Pa., has lately given much study and attention to this subject. He finds that a drill of six feet between the wheels, and with four tubes, instead of eight, gives space sufficient for the horse-hoe in cultivating, and has produced by this method sixty-one bushels per acre, which is more than double the normal yield of his land.

Mr. A. E. Blunt, of the Tennessee Agricultural Station, finds sixteen inches between the drills the best distance for after-culture, and obtained in 1877 (with a top dressing of salt and ashes,) a yield of sixty-seven bushels per acre. Though it is true that these figures are exceptional, yet they can nearly always be approximated by intelligent farmers, and the contrast they present to the current average yield is something more than remarkable, it is positively startling.

May we not then confidently expect to see this mode of culture very promptly and generally adopted by our farmers? If it is not, the fault and the loss will be their own. If, on the other hand, this reformed culture should be at once accepted as the general rule of our practice, the effect would be to nearly double the capacity of production for every acre of this cereal in the country, and the wheat crop of the new decade, now near at hand, would probably show a yield of over seven hundred million bushels.

THE FUTURE OF CATTLE FEEDING.

IT takes time to perfect any industry. The progress made in the manufacture of cotton prints has been very remarkable during the last twenty years in this country. We are able now to compete with the English print manufacturer at his own door. The difference between the cost and quality of our lean steers of thirty years ago and the average of those we now send to market, is nearly as great as between our prints then and now. Then little attention was paid to breeding, four or more years were taken to mature steers for market, and their weight only averaged about 1,100 pounds. Now a large class of the cattle sent to market are Short-horn grades, about three years is their average age, and from twelve to fourteen hundred pounds their average weight. Here is an increase of 25 per cent. in weight and a saving of 25 per cent. in time of feeding. This amounts to a reduction of fifty per cent. in the amount of food required to grow and fatten a steer. This is a long stride to make in thirty years, and we expect the improvement to be still greater in the next thirty.

As the fertility of the soil in the older States lost its virgin freshness, cattle-feeding receded to the new lands of the West where corn grew almost spontaneously, and cattle were produced in millions. But these western cattle were grown under most unfavorable circumstances during winter, exposed to all the inclemency of the weather, and consequently they made much slower progress than if the corn had been fed under shelter. Yet the improved blood—mostly from Short-horn crosses,—the fine summer pasture and the abundance of corn in cold weather, made a very rapid improvement. The calves had also a long period of suckling—milk there being of little value—which assisted much in shortening the period of maturity. The finest class of cattle coming from the West to the Eastern markets stimulated a desire for better feeding in the older States, and this is now gradually changing the system of grain raising in those States into a mixed husbandry, with a great increase in cattle raising. They are just beginning fairly to understand that the more cattle they raise the greater their capacity for grain and other crops. The Eastern and Middle States, thirty years ago, seemed to regard cattle and grain raising as antagonistic, instead of as complimentary to each other.

But this view of the matter is now rapidly changing, and the time is probably not far distant when New York will carry as many cattle to the hundred cultivated acres as England does now. This State now carries about 2,200,000 cattle of all kinds, dairy cows being about two-thirds of this number, whilst the United Kingdom of Great Britain and Ireland is credited, in 1877, with only 5,844,141 cattle of all kinds. The cattle disease has reduced the number nearly 2,000,000 within the last six or eight years. The farmers of the Eastern and Middle States have, to some extent, purchased cattle raised at the West, and sometimes from Kansas and Texas, thin animals two and one-half to three years old, denominated "stockers," and fattened them on grass and grain. But this system has not proved very profitable; for the difficulty that confronts the feeder is the general unthrifty condition of these steers. They have, in a great proportion of cases, been kept in such a state of suspended growth as to lessen the normal capacity of the digestive system and the powers of assimilation. It requires from one to three months before these animals enter upon a stage of thrifty growth, and this time and the food consumed are practically sacrificed, as compared with animals that have been kept in a thrifty condition.

The most experienced feeders prefer, therefore, to purchase only those animals whose digestive organs are all in an active state, and capable of assimilating large amounts of food. Such animals, having been constantly growing since calfhood, will continue this growth and rapidly increase in weight and quality under good feeding. The difficulty of finding such feeding steers in market has led the best farmers to raise their own stock, having thus the control of the animal from calfhood till ripened for market. Here food may be turned to the best account, as the intelligent feeder selects good blood in his breeding male animals, such as have been bred to early maturity, and he is able to grow steers of 1300 to 1500 pounds, when 30 months old. This grade of stock will sell for $80 to $90 per head on any average of ten years. The future of cattle feeding will show a constant increase in the number and quality of beef cattle raised in all the older States, as well as in the great West.

SAVING BY HANDFULS.

ONE handful of hay is not much, nor, for the matter of that, are twenty handfuls; the saving or wasting of so much would neither make nor break a man. But with twenty head of cattle to feed twice or thrice a day, the saving of a handful apiece, every time, would amount to something before the pastures are green again upon our frost-bitten hills. Do you ever think of it? We are not hinting at stinting the cattle. But how many of us allow animals to waste a handful each at every feed, for want of a little attention to feeding arrangements? How many head of stock on our northern farms require a handful more of hay at every feed to keep up the animal heat, than they would require if their stables had all the cracks stopped, that let in the cold winds of winter?

A handful of manure is but a trifle; yet the addition of a single handful in a hill of corn may make the difference between long, full ears and stinted nubbins, when the harvest comes. How many handfuls of manure are going to waste every day about our yards and buildings? Could you not save half a bushel a day, by being careful? And the liquid manure—is there not enough lost every day to make a good many long ears where we shall probably find only nubbins next fall?

Handfuls of hay; handfuls of manure!—these are small matters, say you? Yet upon just such small matters depends many a man's success or failure in life. Here is one man that attends to them carefully, and at the end of twenty or thirty years he has a competency for old age; another neglects them as beneath his notice, and is always behind hand; he lives and dies short in pocket and short in comfort. We do not preach niggardliness; it is by saving when we may that we prepare ourselves to be liberal when we will. Save the handfuls!

Beauty of Hebron.—The Weekly Tribune says that the RURAL NEW-YORKER has dropped into prophecy in a friendly way to the extent of venturing the opinion that the Beauty of Hebron potato, planted side by side with Early Rose, will prove more prolific, at least ten days earlier and be found of better quality. We did so prophesy and we are as confident as one well can be in such matters. But to prove the correctness of our faith and enable our subscribers to judge for themselves, we propose to include this variety in our free seed distribution, the particulars of which as has been before stated, we shall announce some time in November.

Protection against Mice.—Many fine fruit-trees are destroyed in the winter by mice, perhaps just as they are coming to yield something to repay years of care. Let us tell our friends that at the cost of one cent a tree they may rest easy about the mice every night in the winter. Cut common plasterer's laths just long enough to reach the lowest limb, and tie around each tree enough to protect the trunk. Common cotton twine is sufficient; one tie near the top and one near the bottom.

BREVITIES.

CLEAN your cider barrels.

RURAL Grounds, Sept. 28. First frost—a light one.

ATTEND to your poultry houses before cold weather.

OUR readers may look for a raspberry paper next week.

THE FROST OF MAY 14.—Dr. Hexamer tells us that this has been a hard year for him. He lost half of his Strawberries, nearly all of his Raspberries, nearly all of his Grapes, and half of his Apples, all owing to the frost of May 14.

WE publish by request of the distinguished Secretary an address of the Farmers' Alliance, to the farmers of New York. The RURAL NEW-YORKER is no more interested in the farmers of N. Y. State than in those of any other. We hope all may read it with profit.

ICE HOUSES.—We need not again give detailed descriptions of how to build ice-houses. Those intending to build them this fall need only to bear in mind, 1, Perfect drainage; 2, Ample ventilation; 3, A good non-conducting substance between the ice and the air. An ice-house costing $50, that meets the above requirements, will keep ice as long as if ten times that amount were expended.

MUCH has been said of late years by quasi-scientists about the dire impoverishment of land caused by the waste of sewage, but among practical experimenters there has been a good deal of doubt as to the value of this species of fertilizer. Dr. Voelcker, in a recent publication says that in his opinion the most economical treatment of sewage, is to carry it bodily far enough to the open sea to destroy any chance of its ever being brought back to land by the tide.

THE INTERNATIONAL DAIRY FAIR.—A meeting of the Executive Committee of the International Dairy Fair, was lately held in this city. From the treasurer's report it appears, that the total subscriptions thus far amount to $2,800. Hitherto no single subscription had been received for less than $100, and it was proposed henceforth, to start a list of smaller donations. Arrangements have been made with the proprietors of Gilmore's Garden here, for leasing that building on favorable terms, and it is intended to open the Fair on December the 4th, the earliest date at which the place could be hired. It is proposed to charge two dollars for every entry made, and it is expected that there will be at least 1,000 of them.

THE Vermont Watchman and State Journal has for its agricultural editor our occasional contributor, Dr. T. H. Hoskins. We know him only as the agricultural and horticultural world have long known him—through his able and versatile pen. We take occasion to speak of him as an exception to the rule of which Dr. Sturtevant complains, viz., that prominent agriculturists are too chary of their praise of others who are laboring in the same field. Dr. Sturtevant, who, generously consistent with his complaint, seems to derive much pleasure in recognizing worthy efforts wherever he sees them, bestows very emphatic words of praise in the September number of his Scientific Farmer, upon an agricultural contemporary. Dr. Hoskins quotes this in *his* journal, and adds: "But the Scientific Farmer can afford to be appreciative of the work of others, having so much merit of its own. We are glad that it, too, finds its field of usefulness widening, through the appreciation it receives from the more studious and progressive farmers of the nation."

Literary Miscellany.

THE STORY OF THE TILES.

Before a quaint old fire-place
Full fifty years ago,
Dear grandma and I, a child,
With locks of gold and snow,
Looked, our two heads together,—
She sitting in her chair
And I erect beside her,—
A comfortable pair.
For while within the fire-light our eyes were lit with smiles,
She told her little grandson the story of the tiles.

Here was a knight in armor,
A brave old lord was he!
He won full toilsome battles
In many a far countree;
And here, his lute, with ribbons
Trimmed bravely, fond and true,
Beneath his lady's casement,
Sang a troubadour in blue.
Now with pure fact or fancy dear grandma time beguiles,
Now fairy lore she weaveth in her stories of the tiles.

The stork with leg uplifted;
The windmill on the plain;
The sun with rays of azure;
The sheaf of ripened grain,
Were each a theme for story,
For song or comic verse,
And merrily and often
Did grandma these rehearse!
For quips and quirks were grandma's, and cranks and wanton wiles,
When once she got a-telling her stories of the tiles.

The fire-place stands unshaken;
The milkmaid trips so gay,
To meet the fat old beadle,
Who always looks her way;
The frog who went a-wooing
Still peeps out at the crane,
But grandma with her stories
Will never come again.
From that old English fire-place I've wandered many miles,
But still my heart remembers the stories of the tiles.

Like that old knight in armor
Brave must I be, she said,
And courteous as the singer
To every wife and maid;
Industrious and cheerful
As the milkmaid on the lea,
And prayerful and religious
As the beadle ought to be.
Alas! such spotless record how many a fault defiles!
I've proved a sorry hero for her stories of the tiles.

But still when night is falling,
And children's voices call
Across the pleasant play-room
And down the echoing hall,
I find myself while waiting
To catch them in my arms,
Thinking the stories over
With all their varied charms;
And then, when grouped around me, their lips are wreathed with smiles,
I tell their great-grandmother's sweet stories of the tiles.

[*Golden Age.*

COMMUNISTS AND CAPITALISTS.

A SKETCH FROM LIFE.

OCTAVE THANET.

The Countess von Arno was Mr. Seleigman's confidential clerk. Not that M—— smiled over any such paradox: the countess called herself simply Mrs. von Arno.

M—— is a picturesque town on the Mississippi, devoted in general to the manufacture of agricultural implements. The largest plow-factory is Seleigman's: he does business all over the world. A clerk who wrote French, German and Italian fluently was a godsend. This clerk, moreover, had an eminently concise and effective style, and displayed a business capacity which the old German admired immensely. As much because of her usefulness as the modest sum she was able to invest in the business, he offered her a small share in it four years after she first came to M——. She had come to M—— because Mrs. Greymer lived there. Therese Greymer had known the countess from her school-days. When Therese's husband died she came back to her father's house, but spent her summers in Germany. Then old Mr. Dare died suddenly, leaving Therese with her little brother to be cared for, and only a few thousand dollars in the world. About this time the countess separated from her husband. "So I am poor," said she, "but it will go hard if I can't take care of you, Therese." Thus she became Mr. Seleigman's clerk. M—— forgave her even her undoubted success in making money, on account of Mrs. Greymer. It had watched Therese grow from a slim girl, with black braids hanging down her white neck as she sat in the "minister's pew" of the old brick church, into a beautiful woman in a widow's bonnet. Therese went now every Sunday to the same church where her father used to preach. The countess accompanied her most decorously.

The countess had a day-dream: the dreams which most women have had long ago had been rudely broken for her, and the hopes which she cherished now had little romance about them. She knew her own powers and how necessary she was to Seleigman: some day she saw the firm becoming Seleigman & Von Arno, the business widening, and the plows, with the yellow eagle on them, in every great city of Europe. "Then," said the countess to herself, standing one March morning, four years after she had first come to M——, by the little dining-room window —" then we can perhaps persuade the workmen to buy stock in the concern and have a few gleams of sense about profits and wages."

She lifted one arm above her head and rested her cheek against it. She was of the goddess type, tall, fair-faced and stately, with thick, pale gold hair, and brown lashes lifted in level lines from steady, deep-gray eyes, "Pretty" seemed too small a word for such a woman yet "beautiful" conveys a hint of tenderness; and Mrs. von Arno's face—it might be because of those steady eyes—was rather a hard face, notwithstanding the soft pink and white of her skin, and even the dimples that dented her cheek when she smiled.

Now she was smiling. The air was heavy with the damp chill of early spring; and as the countess absently surveyed a gravel-walk bordered by limp brown grasses and a line of trees dripping last night's frost through the fog, she saw a woman's figure emerge from the shadows and come slowly up the walk. She was poorly dressed, and walked to the kitchen-door, where the countess could see her carefully wipe her feet before rapping.

"That must be Bailey's wife," she thought; "I saw her waiting for him yesterday when he came round to the shops for work. William, my friend, you are a nuisance."

With this comment she went to the kitchen. Lettice, the maid-of-all-work, was frying cakes in solitude. "Mrs. Greymer had taken Mrs. Bailey into the library," she told the countess with significant inflections.

The latter went to the library. It was a tiny, red-frescoed room fitted up in black-walnut. There were plants in the bay-window: Mrs. Greymer stood among them, her soft gray wrapper falling in straight and ample folds about her slender figure. Her face was turned toward the countess; a loosened lock of black hair brushed the blue vein on her cheek; she held some lilies-of-the-valley in her hand, and the gold of her wedding-ring shone against the dark green leaves.

"She looks like one of Fra Angelico's saints," thought the countess: "the crimson lights are good, too."

She stood unnoticed in the doorway, leisurely admiring the picture. Mrs. Bailey sat in the writing-chair on her right. Once, probably, she had been a pretty woman, and she still had abundant wavy brown hair and large dark-blue eyes with curling lashes; but she was too thin and faded and narrow-chested for any prettiness now. Her calico gown was unstarched, though scrupulously clean: she wore a thin blue-and-white summer shawl, and her old straw bonnet was trimmed with a narrow blue ribbon pieced in two places. Her voice was slightly monotonous, but low-keyed; as she spoke her hands clasped and unclasped each other. The veins stood out and the knuckles were enlarged, but they were rather white than otherwise.

She went on with her story: "The children are so good, Mrs. Greymer; but six of them, and me not over strong—makes it hard. We hain't had anything but corn meal in the house all this week, and the second-hand woman says our things ain't worth the carting. The children have got so shabby they hate to go to school, and the boys laugh at Willie 'cause his hat's his pa's old one and ain't got no brim, though I bound it with the best of the old braid, for I thought maybe they'd think it was a cap. And the worst was this morning, when there was nothin' but just mush: we hadn't even 'lasses, and the children cried. Oh, I didn't go to tell you all this: you know I ain't a beggar. I've tried to live decent. Oh dear! oh dear!" She tried to wipe away the tears which were running down her thin cheeks with the tips of her thin fingers, but they came too fast. Mechanically, she put her hand in her pocket, only to take it out empty.

Mrs. Greymer slipped her own dainty handkerchief, which the countess had embroidered, into the other's hand. "You ought to have come to me before, Martha," she said reproachfully—"such an old friend as I am!"

"'Tain't easy to have them as has known you when you lived like other folks see you without even a handkerchief to cry on," said Mrs. Bailey. "If I'd known where to turn for a loaf of bread, I'd not ha' come now; but I can't see my children starve. And I ain't come to beg now. All we want is honest work. William has been everywhere since they sent him away from Dorsey's just because the men talked about striking, though they didn't strike. He's been to all the machine shops, but they won't take him; they say he has too long a tongue for them, though he's as sober and steady a man as lives, and there ain't a better workman in M——, or D—— either. William is willing to do anything: he tried to get work on the streets, but the street commissioner said he'd more men he'd employed for years asking for work than he knew what to do with. And I thought—I thought, Mrs. Greymer, if you would only speak to Mrs. von Arno—"

"Good morning, Mrs. Bailey," said the countess, advancing. She had a musical voice, clear and full, with a vibrating quality like the notes of a violin—a very pleasant voice to hear, yet it hardly seemed reassuring to the visitor. Unconsciously, she sat up straighter in her chair, her nervous fingers plaiting the fringe of her shawl.

"I heard you mention my name," the countess continued: "is there anything you wish of me?"

Therese came to Mrs Bailey's assistance: "Her husband is out of work: can't you do something with Mr. Seleigman, Helen? Bally is a good workman."

"He is indeed, ma'am," added Bailey's wife eagerly, "and as sober and faithful to his work; he never slights one bit."

"I don't doubt it," said the countess gravely; "but, Mrs Bally, if we were to take your husband on, and the union were to order a strike, even though he were perfectly satisfied with his own wages, would'nt he strike himself, and do all he could to make the others strike?" Mrs. Bailey was silent.

"A strike might cost us thousands of dollars. Naturally, we don't want to risk one; so we have no union-men. If Bailey will leave the union he may go to hammering ploughshares for us to morrow, and earn with his skill, twenty dollars a week."

Mrs. Bailey's face worked. "'Tain't no use ma'am," she said desperately: "he won't go back on his principles. He says it's the cause of Labor and he'll stick to it till he dies. You can't blame him, ma'am, for doing what he thinks is right."

"Perhaps not. But you see that it is impossible for us to employ your husband. Isn't there something I can do for you yourself, though? Mrs. Greymer tells me you sew very neatly."

"Yes, I sew," said Mrs. Bailey in a dull tone. "but I'd be obliged to you, ma'am, if you'd give me the work soon; I've a machine now, and I'll likely not have it next week. There's ten dollars due on it, and the agent says he'll have to take it back. I've paid fifty dollars on it, but this month and last times was so hard I could'nt pay."

The countess put a ten-dollar bill in her hand. "Let me lend you this, then," she said, unheeding the half shrinking of Mrs. Bailey's face and attitude; and then she avoided all thanks by answering Lettice's summons at the door.

"Poor little woman!" she said to Mrs. Greymer at breakfast—"she did'nt half like to take it. She looked nearly starved too, though she ate so little breakfast. How did you manage to persuade her to take that bundle?"

"She is a very brave little woman, Helen. I should like to tell you about her," said Mrs. Greymer.

"Until a quarter of eight my time is yours, and my sympathy, as usual, is boundless."

Mrs. Greymer smiled slightly. "I have known her for a great many years," she said, disregarding the countess's last speech: "she went to school with me, in fact. She was such a pretty girl then! Somehow, she took a fancy to me, and used to help me with my Practical Arithmetic—"

"So called because it is written in the most unpractical and incomprehensible style; yes, I know it," interrupted the countess.

"Martha was much brighter than I at it, anyhow, and used to do my examples. I remember I cried when her people moved to Chicago and she left school. I did'nt see her for almost ten years; then I met her accidentally on Randolph street in Chicago. She knew me, and insisted on my going out with her to see her home. It was in the suburbs, and was a very pretty, tidy little place, with a garden in front, where Martha raised vegetables, and a little plot for flowers. She was so proud of it all and of her two pretty babies, and showed me her chickens and her furniture and a picture of her husband. They had bought the house, and were to pay for it in six years, but William was getting high wages, and she had no fears. Poor Martha!"

"Their Arcadia did'nt last?"

"No. William got interested in trades-union; there was a strike, and he was very prominent. He was out of work a long time, and Martha supported the family by taking in sewing and selling the vegetables. Then her third child was born, and she was sick for a long time afterward; she had been working too hard, poor thing! His old employers took William on with the rest of the men when the strike ended, but very soon found a pretext for discharging him; and in short they used up all their little savings, and the house went. William thought he had been ill-used, and became more violent in his opinions."

"A Communist, is'nt he?"

"I believe so. Martha with her three children could'nt go out to work, but she is a model housekeeper, and she opened a little laundry with the money she got from the sale of some of their furniture. William got work, but lost it again, but Martha managed in a humble way to support the family until William had an offer to come here; so they sold out the laundry to get money to move."

"Very idiotic of them,"

"After they came here they at first lived on Front street, which is near the river, and Martha caught the chills and fever. William soon lost his place, and they moved across the river to D——. He became known as a speaker and things have been going from bad to worse; the children have come fast, and Martha has never really recovered from her fever; and they have had simply an awfully hard time. I have'nt seen Martha for three months, and have tried in vain to find out where she lived. Poor Martha! she has never complained, but it has been a hard life for her."

"Yes, a hard life," repeated the countess, rising and putting on her jacket; "but it seems to me she has chiefly her own husband to thank for it. And six children! I have my opinion of Mr. William Bailey."

"You are hardly just to Bailey, Helen; he has sacrificed his own interests to his principles. He is as honest—as honest as the Christian martyrs, though he *is* an infidel."

"Helen, you and the people like you laugh at Communism and the complaints of the laboring classes, but it's like Samson, blind though he is, the communist will one day, unless we do something beside laugh, pull the pillars down on his head—and on ours."

"He will *try*," said the countess; "if we are wise, we shall be ready and shoot him dead." She kissed Mrs. Greymer smilingly, and went away. Her friend, watching her from the window, saw her stop to pat a great dog on the head and give a little boy a nickel piece.

One Sunday afternoon, two weeks later, the two friends crossed the bridge to D——to visit the Baileys. When they reached the end of the bridge they paused a moment to rest.

The countess drew a long breath; she had a keen feeling for beauty. "Yes, it is a lovely place," she said. "The hills are not high enough but the river makes amends for everything. But what are those hideous shanties, Therese?"

Are they not hideous?" said Mrs. Greymer. "They are all pine, and it gets such an ugly dirt-black when it isn't painted. The glass is broken out of the windows and the shingles have peeled off the roofs. When it rains the water drips through. In spring, when the river rises, it comes up to their very doors; one spring it came in. It is not a nice place to live in."

"Not exactly: still, I suppose people do live there,"

"Yes, the Baileys live there. You see, the rent is low."

The countess lifted her eyebrows and followed Mrs. Greymer without answering. Some sulky-looking men were smoking pipes on the door-steps, and a few women, whose only Sunday adorning seemed to have been plastering their hair down over their cheeks with a great deal of water, gossiped at the corner. Half-a-dozen children were playing on the river-bank.

"They fall in every little while," Therese explained, "they are so small, and most of the mothers here go out washing. This is the Bailey's."

William Bailey answered the knock. He was a tall man, who carried his large frame with a kind of muscular ease. He had a square, gray-whiskered face with firm jaws and mild light-blue eyes. The hair being worn away from his forehead made it seem higher than it really was. He wore his working clothes and a pair of very old boots cut down into slippers. The only stocking he had was in his hand, and he appeared to have been darning it. Close behind him came his wife, holding the baby. The bright look of recognition on her face at the sight of Mrs. Greymer faded when she perceived the countess. Rather stiffly she invited them to enter.

The room was small and most meanly furnished, but it was clean. The walls were dingy beyond the power of soap and water to change, but the floor had been scrubbed, and what glass there was in the windows had been washed. There were occasional holes in the ceiling and walls where the plaster had given way: out of one of these peered the pointed nose and gleaming eyes of a rat. Judging from sundry noises she heard, the countess concluded there were many of these animals under the house, though what they found to live on was a puzzle; but they ate a little of the children now and then, and perhaps the hope of more sustained them. A pale little boy was lying on a mattress in the corner covered with a faded blue-and-white shawl.

Therese had mysteriously managed to dispose of the basket she had brought before she went up to him and kissed him, saying, "I am sorry to see Willie is so sick."

"Yes," said Bailey, smiling bitterly. "The doctor says he needs dry air and exercise: it's damp here."

"Tommy More has promised to lend us his cart, and Susie will take him on the island," Mrs. Bailey said hastily; "it's real country there."

"But you have to have a pass," answered Bailey in a low tone.

"Anyone can get a pass," said the countess, "but if you prefer I will ask the colonel to-day, and he will send you one to-morrow."

For the first time Bailey looked the countess in the face: his brows contracted, he opened his lips to speak.

"Oh, papa," cried the boy in a weak voice trembling with eagerness, "the island is splendid! Tommy's father works there, and they's cannon and a foundry and a live eagle!"

"Yes, Willie dear," said his father as he laid his brown hand gently on the boy's curls. He inclined his head toward the countess. "I'll thank you," he said gravely.

The countess picked up a pamphlet from the table, more to break the uncomfortable pause which followed than for any other reason. "Do you like this?" she said, hardly reading the title.

"I believe it," said Bailey; "I am a Communist myself." He drew himself up to his full hight as he spoke; there was a certain suppressed defiance in his attitude and expression.

"Are you?" said the countess. "Why?"

"Why?" cried Bailey. "Look at me! I'm a strong man, and willing to do any kind of work. I've worked hard for sixteen years; I've been sober and steady and saving. Look what all that work and saving has brought me! This is a nice place for a decent man and his family to live in, ain't it? Them walls ain't clean? No, because scrubbing can't make 'em. The grime's in the plaster; yes, and worse than grime—vermin and disease sech as 'tain't right for me to mention even to ladies like you, but it's right enough for sech as us to live in. Yes, by G——! to *die* in!" He was a man who spoke habitually in a low voice, and it had not grown louder, but the veins on his forehead swelled and his eyes began to glow.

"It is hard, truly," said the countess. "Whose fault is it?"

"Whose fault?" Bailey repeated her words vehemently, yet with something of bewilderment. "Society's fault, which grinds a poor man to powder, so as to make a rich man richer. But the people won't stand this sort of thing for ever."

"You would have a general division of property, then?"

"Indirectly, yes. Power must be taken from bloated corporations and given to the people; the railroads must be taken by government; the accumulation of capital over a limited amount must be forbidden; men must work for Humanity, and not for their selfish interests."

"Do you know any men who are working so?"

"I know a few."

"Mostly workingmen?"

"All workingmen."

"Don't you think a general division of property would be for *their* selfish interests?"

"I don't call it selfish to ask for just a decent living."

"I fancy the chiefs of your party would demand a great deal more than a decent living. Mr. Bailey, the rights of property rest on just this fact in human nature: A man will work better for himself than he will for somebody else. And you can't get him to work unless he is guaranteed the

fruits of his labor. Capital is brain, and Labor is muscle, but the brain has as much to do with the creation of wealth as muscle; more, for it can invent machines and do without muscle, while muscle cannot do without brain. You can't alter human nature, Mr. Bailey. If you had a Commune, every man would be for himself there as he is here; the weak would have less protection than even now, for all the restraints of morality, which are bound up inseperably with rights of property, would have been thrown aside. Marx and Lasalles and Bradlaugh, clever as they are, can't prevent the survival of the fittest. You knock your head against a stone wall, Mr. Bailey, when you fight society. You have been knocking it all your life, and now you are angry because your head is hurt. If you had never tried to strip other men of their earnings because you fancied you ought to have more, as skillful a blacksmith as you would have saved money and been a capitalist himself. Supposing you give it up? Our firm will give you a chance to make ploughshares and earn twenty dollars a week if you will only promise not to to strike us in return the first chance you get."

The workingman had listened with a curling lip. "Do you mean that for an offer?" he said, in a smothered voice.

"I mean it for an offer, certainly."

"Oh, William!" cried his wife, turning appealing eyes up to his face.

He grew suddenly white, and brought his clenched hand heavily down on the table. The dishes rattled with the jar, and the baby, scared at the noise, began to scream. "Then," said Bailey, "you may just understand that a man ain't always a sneak if he *is* poor; and you can be glad you ain't a man that's tempting me to turn traitor."

"I am sure my friend didn't mean to hurt your feelings," Mrs. Greymer explained quickly, giving the countess that expressive side-glance which much more plainly than words says, "Now you *have* done it!" Mrs. Bailey was walking up and down soothing the baby: the little boy looked on open-eyed.

"I am sorry if I have said anything which has seemed like an insult," said the countess: "I certainly didn't intend one. Perhaps after you have thought it all over you will feel differently. You know where to find me. Good-evening."

She held out her hand, which Bailey did not seem to see, smiled on the little boy and went out, leaving Mrs. Greymer behind.

A little girl with pretty brown curls and deep-blue eyes was making sand-caves on the shore. The countess spoke to her in passing, and left her staring at her two hands, which were full of silver coin. At the bridge the countess paused to wait for her friend. She saw her come out, attended by Mrs. Bailey: she saw Mrs. Bailey watch her, saw the little girl give her mother the money, and then saw the woman, still carrying her baby in her arms, walk slowly down the river-bank to where a boat lay keel uppermost like a great black arrowhead on the sand. Here she sat down, and, clasping the child closer, hid her face in its white hair.

On Monday, Mrs. Greymer proposed asking little Willie Bailey to spend a week with them. The countess assented, merely saying, "You must take the little fellow to drive every day, and send the livery-bills to me."

"Then I shall drive over this afternoon if Freddy's sore throat is better," said Mrs. Greymer.

But she did not go: Freddy's sore throat was worse instead of better, and his sister had enough to do for some days fighting off diphtheria. So it happened that it was a week before she was able to go to D——. She found the Baileys' door swinging on its hinges, and a high-stepping hen of inquisitive disposition investigating the front room: the Baileys had gone.

"They went to Chicago four days ago," an amiable neighbor explained: "they didn't say what for. The little boy he cried 'cause he wanted to go on the island fust. Guess *he* ain't like to live long: he's a weak, pinin' little chap."

Only once did Therese hear from Mrs. Bailey. The letter came a few days after her useless drive to D——. It was dated Chicago, and expressed simply but fervently her gratitude for all Mrs Greymer's kindness. Inclosed were three one-dollar bills, part payment, the writer said, "of my debt to Mrs. von Arno, and I hope she won't think I meant to run away from it because I can't just now send more." There was no allusion to her present condition or her prospects for the future. Mrs. Greymer read the letter aloud, then held out the bills to the countess.

She pushed them aside as if they stung her. "What does the woman think I am made of?" she exclaimed. "Why, it's hideous, Therese! Write and tell her I never meant her to pay me."

"I am afraid the letter won't reach her," said Mrs. Greymer.

Nor did it: in due course of time Therese received her own letter back from the Dead-Letter Office. The words of interest and sympathy, the plans and encouragement, sounded very oddly to her then, for, as far as they were concerned, Martha Bailey's history was ended. It was in July the countess had met them again. She was in Chicago. Otto Von Arno was dead. He had given back to his wife by his will the property which had come to him through her; whether because of a late sense of justice or a dislike to his heir, a distant cousin who wrote theological works and ate with his knife, the countess never ventured to decide. The condition of part of this property, which was in Chicago, had obliged her to go there. She arrived on the evening of the fifteenth of July—a day Chicago people remember because the great railroad strike of 1877 reached the city that day.

The countess found the air full of wild rumors. Stories of shops closed by armed men, of vast gatherings of Communists on the North Side, of robbery, bloodshed and to a Chicago ear most blood-curdling whisper of all—of a contemplated second burning of the city, flew like prairie-fire through the streets.

The countess' lawyer, whom she had visited very early on Thursday morning, insisted on accompanying her from his office to her friend's house on the North Side. On Halsted street their carriage suddenly stopped. Putting her head out of the window, the countess perceived that the coachman had drawn up close to the curbstone to avoid the onset of a yelling mob of boys and men armed with every description of weapon, from laths and brickbats to old muskets. The boys appeared to regard the whole affair as merely a gigantic "spree," and shouted "Bread or Blood!" with the heartiest enthusiasm; but the men marched closer, in silence and with set faces. The gleaming black eyes, sharp features and tangled black hair of half of them showed their Polish or Bohemian blood. The others were Norwegians and Germans, with a sprinkling of Irish and Americans. Their leader was a tall man whom the countess knew. He had turned to give an order when she saw him. At that same instant a shabby woman ran swiftly from a side street and tried to throw her arms about the man's neck. He pushed her aside, and the crowd swept them both out of sight.

"I think I have seen a woman I know," said the countess composedly; "and do you know, Mr. Wilder, that our horses have gone? Our Communist friends prefer riding to walking, it seems." They were obliged to get out of the carriage. The countess looked up and down the street, but saw no trace of the woman. Apparently, she had followed the mob.

By this time some small boys, inspired by the occasion, had begun to show their sympathy with oppressed labor by pelting the two well-dressed strangers with potatoes and radishes, which they confiscated from a bloated capitalist of a grocer on the corner. The shower was so thick that Mr. Wilder was relieved when they reached the Halsted street police-station, where they sought refuge. Here they passed a sufficiently exciting hour. They could hear plainly the sharp crack of revolvers and the yells and shouts of the angry mob blending in one indistinguishable roar. Once a barefooted boy ran by, screaming that the police were driven back and the Communists were coming. Then a troop of cavalry rode up the street on a sharp trot, their bridles jingling and horses' hoofs clattering. The roar grew louder, ebbed, swelled again, then broke into a multitude of sounds—screams, shouts and the tumultuous rush of many feet.

A police sergeant opened the door of the little room where the countess was sitting to inform her the riot was over. They were just bringing in some prisoners: he was very sorry, but one of them would have to come in there. He was a prominent rioter whom they had captured trying to bring off the body of his wife, who had been killed by a chance shot. It would be only for a short time: the gentleman had gone for a carriage. He hoped the lady wouldn't mind.

The lady, who had changed color slightly, said she should not mind. The sergeant held the door back, and some men brought in something over which had been flung an old blue-and-white shawl. They carried it on a shutter, and the folds of a calico dress, torn and trampled, hung down over the side.

Then came two policemen, pushing, after the official manner, a man covered with dust and blood.

"Bailey!" exclaimed the countess. Their eyes met.

Bailey bent his head toward the table where the men had laid their burden. "Lift that," he said hoarsely.

The countess lifted the shawl with a steady hand. There was an old white straw bonnet flattened down over the forehead; a wisp of blue ribbon string was blown across the face and over the red smear between the eyebrow and the hair; the eyes stared wide and glassy. But it was the same soft brown hair. The countess knew Martha Bailey.

"There was women and children on the sidewalk, but they fired right into us," said Bailey. He spoke in a monotonous, dragging voice, as though every word were an effort. "They killed her. I asked you to give me work in your shop, and you wouldn't do it. Here's the end of it. Now you can go home and say your prayers."

"Ain't you satisfied with what you have done already?" continued Bailey. "Leave me alone: you'd better."

"Gently now!" said one of the policemen.

"Whatever you may think of me," said the countess, quietly, "you know Mrs. Greymer was always your wife's friend. We only wanted to help her."

Bailey shook off the grasp of the policemen as though it had been a feather: with one great stride he reached the countess and caught her roughly by the wrist. "Look at *her*, will you?" he cried: "you and the likes of you, with your smooth cant, have killed her! You crush us and starve us till we turn, and then you shoot us down like dogs. Leave my children alone."

"None of that, my man!" said the sergeant.

The two policemen would have pulled Bailey away, but the countess stopped them. She had turned pale even to her lips, but she did not wince.

"Curse you!" groaned the Communist, flinging his arms above his head; "curse a society which lets such things be! curse a religion——"

The policemen dragged him back. "You'd better go, I think, ma'am," said the sergeant; "the man's half crazy with the sun and fighting and grief."

"You are right," said the countess. She stopped at the station-door to put a bill in the policeman's hands: "You will find out about the children and let me know, please."

Mr. Wilder, who had been standing in the doorway, an amazed witness of the whole scene, led her out to the carriage. "He's a bad fellow, that rioter," he said, as they drove along.

The countess pulled her cuff over a black mark on her wrist. "No, he is not half a bad fellow," she answered, "but for all that he has murdered his wife."

Nor has she ever changed her opinion on that point; neither, so far as is known, has William Bailey changed his.—*Lippincott's for October.*

SUTTEE.

THE position of widows among the Hindoos is one which, even at the present day, and with all the modifications introduced by European influence, is far from being a pleasant one. When the early age at which children are married in India is remembered, it will be seen that it is quite possible for a little girl seven or eight years old to be a widow. Until a very recent period a poor child, upon whom this affliction had fallen, had not the remotest chance of ever, during her life, leading anything but the most uncomfortable kind of existence. Re-marriage was quite out of the question; and the poor creature, during her whole life, could neither enjoy nor look forward to any of the pleasures or consideration accorded to a Hindoo woman. The barest subsistence was accorded to her, she was expected during her whole life to "efface" herself, and, when she was ill, was left to die alone and untended. That such a state of things is now only too prevalent in Hindoostan is unfortunately true, for the few re-marriages of widows of which we hear, take place in families that have much modified their religious beliefs, and that may be said to have outgrown in a great measure the power of old prejudice. Custom, which was so severe in the case of children left widows, was and is no less so in the case of women who have, as adults, been wives for many years. To them, the fall from the position of wife to that of widow was more painful than even that of the child, who had scarcely known what it was not to be in the widowed condition.

The old practice was—the hair of widows was cut off; they were not allowed to touch betel, to wear precious stones, or to marry again; they were incapacitated from enjoying even the smallest trifle; they were not allowed to have even the least honor paid to them; they inherited nothing of their husband's property, but were at the mercy of their eldest son (if they had one), or at that of their husband's brother, who was only obliged to afford them a bare maintenance. Is it to be wondered at that, while suttee was allowed in Hindoostan, a very large number of Hindoo women should avail themselves of what was a painful, but at least a rapid mode of getting rid of their miseries? or that every now and then we hear of an instance in which, even at the present day, suttee is attempted or perhaps carried out? The practice of suttee was formally abolished in the year 1829 in all those parts of Hindoostan over which England has power; and, as that is so great an area, people have almost begun to look upon the institution as a thing of the past.

It, therefore, comes upon the ordinary reader with something of a shock to read of the suttee of three ladies, at the time of the burning of the body of the late Sir Jung Bahadoor. A warm friend and staunch ally of England, a Knight of the Order of the Star of India, a man in many ways far above the prejudices of his nation, the real head of the Nepaulese State, which still jealously maintains its independence, Jung Bahadoor had been made much of in England and by English people. Nothing can give a more vivid idea of the vast differences that separate Hindoos from English people than the fact that at the performance of the last rites of such a man, suttee should have been made a part.

The whole account is just like that which we have read over and over again. The three principal ranees, his brother and son, arrived, and the ranees expressed their desire to sacrifice themselves. The brother tried to dissuade them, but he failed, and the funeral pyre was prepared with sandal-wood, resin and a large quantity of ghee. When the arrangements had been made, the ladies bathed, performed poojah, and made presents to the Brahmins. The next step was, they took measures for the government of the country and to maintain peace; then general directions were given to the brother-in-law. Their last act was to release some prisoners. They then entered the funeral pyre quite unconcernedly, muttering prayers. The corpse was then laid on its back, and the eldest ranee took its head in her lap, and the two others took the feet. They were then surrounded by odorous combustibles, and the ranees gazed upon the features of their husband, as if forgetful of every other consideration. The fire was then applied by the son, and, in a few minutes, all was over. To these poor ladies life must have had a dreary outlook, and the sense of fulfilling a high duty, both in expressing love for their deceased husband, and in performing what they had been taught to consider a religious act, doubtless sustained them to the end.

May the time be not far distant when the advent of a higher faith may direct the strong sense of duty and noble courage evinced by these Hindoo women to a better cause!

EUROPEAN TRADE NOTES.

THE French finance minister is about to refund a portion of the French debt at 3 per cent, less than $100,000,000 however. It is difficult to find employment for capital, and a reduction in the current rates of interest is inevitable. At the present moment the commercial situation is quite as favorable in Germany as in France. The German commercial spirit, so greatly developed in the last quarter of a century, has built up a great foreign market for German goods. The trade of Berlin in fine manufactures rivals that of Paris and London. The Berlin worsteds and hosiery are now matched with collars and cuffs and entire suits of dress goods. Says one letter, "retail shops in the west end of London are buying largely in Berlin and neglecting Paris." The German fine leathers have a steady sale, although the superiority of American goods of a certain class is acknowledged. The Germans are prospecting actively for petroleum and laboring to utilize their Westphalian coal deposits, so they will cease to be dependent in some measure on England for coal. The French and Spanish shipping interests are low. These countries are protected by a tariff, while the marine of Germany, which only touches the ocean on one side, has vastly expanded under free trade, and now carries her manufactures and products to every clime. The foreign commerce of Germany probably does not approach in magnitude that of France, because the natural recources of the former country do not command the homage of those of France. Sweden, also, another free-trade country, is growing vastly in her shipping and commercial interests. The extension of railways in France, which is about to be undertaken under the supervision of the state, is to be conducted with a prudent regard to the character of the roads as feeders and not main lines. They are to be of light structure, especially adapted to a small train service.—*Springfield Rep.*

IT is now said that the memoirs which Talleyrand left behind him, to be published 30 years after his death, will probably appear in Paris the coming winter, as it was determined in 1868 that the period should be extended 10 years, in consequence of certain persons nearly related to the events still surviving at that time. This work has been anxiously expected, and it can hardly fail to be of extraordinary interest, not to the French alone, but to Europe generally, and to America also. The limping devil, as the author has been called, lived through so many years—he was over 84 when he died—and played so active a part in the memorable things that happened, that his observations and recollections will pique, while they gratify, intellectual curiosity. He had, too, such a cool, deliberate, brilliant, bitter way of saying things that his recital must be materially enhanced. Nearly all French memoirs are more or less alluring, and Talleyrand's ought to be particularly so. An ecclesiastic, a rake, a diplomat, a wit, a financier, a statesman, a Prince of the oldest blood, a brilliant conversationalist, and always a man of the world in the largest and worst sense, living under Louis XVI. through the revolution, under the Empire, under Louis XVIII., his mind became a storehouse of important facts and reflections. He was on intimate terms with the Napoleon, with Voltaire, Rousseau, Mirabeau, Diderot, D'Alembert, Grimm, Mmes. Chatelet, Epinay, Stael, Recamier, all the celebrated men and women, indeed, of the eighteenth and the early part of the nineteenth century.

MAGAZINE NOTES.

SUNDAY AFTERNOON for October opens with A Workingman's Story. It is both a graphic account of personal experience as a tramp, and a forcible statement by an unemployed workingman of that problem which stares so many of his fellow laborers in the face now, viz: how to keep starvation from their families. It is timely and suggestive, and also *true*. In the form of a sketch about Mrs. Barnard's Church, Mary Wager-Fisher states the reason for and against women as ministers. Will or Environment? by Rev. Dr. J. T. Tucker of Boston, discusses in a readable way whether a person's will or his surroundings have most influence in shaping his character. The English Reformation is treated by the competent pen of Rev. Lyman Abbott. Mrs. Clara B. Martin of Boston, in Modecai Cohen and Emanuel Deutsch, sketches the original of the well-known Modecai in Daniel Deronda. He was a noble character. E. E. Hale's serial, the Chips from a North-western Log, and Fishers of Men are continued. Judith and Judiah, by the author of Tom's Heathen, is concluded. Mary A. P. Stansbury has a story, and there is another, 'Tramps and Agents.

The poets of the number are Paul H. Hayne, Lucy Larcom, Caroline Leslie, and M. E. Bennett.

In Preaching Honesty the editor urges the need that Thou shalt not Steal should be translated into the terms of modern commercial life. He also talks about Work for the Unemployed, and Expounding Providences, and has the usual Notes on Current Events.

THE DOMESTIC MONTHLY contains a large array of designs for costumes and individual garments, while an abundance of useful information is supplied in the articles on Seasonable Fabrics, Trimmings, Jewelry, Fashions, Domestic Art, etc. The colored plate is, as usual, very handsome, and represents several stylish street and house costumes.

The literary contents are an installment of Mary Cecil Hay's charming serial, Her Three Lovers; a clever sketch, entitled Dr. Carnigie's Inheritance; a second paper on household art by Mrs. Merighi, which is instructive, and No. 1 in a new series of Flower Talks, by Eben E. Rexford. In addition there is some choice poetry, the usual enjoyable Miscellany, engaging small Talk, instructive Household Department, Critiques o New Books, and the always entertaining contributions of the Mosaics Man.

APPLETONS' JOURNAL for October leads off with an illustrated paper under the Shakespearean title of The Multitudinous Seas. A new American novelette is begun in this number, written by Christian Reid, and bearing the title of A Hidden Treasure. A Leap-Year Romance is concluded. A story by Mrs. Stoddard, entitled The Swanstream Match, and one by Mrs. Amelia E. Barr, are given complete. There is a graphic paper, entitled A Motley University; the Azores are described; so is the Czardas, a Hungarian dance; American and English housekeeping are compared by Mrs. Sheldon; and Dr. George M. Beard's discourses on Consolation for the Nervous; Junius Henri Browne discusses French Memoirs; lastly, there are poems by Nora Perry, Constance Feni-

more Woolson, Edgar Fawcett, and others. The editorial departments are as full as usual.

THE ECLECTIC MAGAZINE for October contains fourteen well-selected articles, besides the editorial departments. Mr. Edmund Guerney has the first paper on Music and Musical Criticism; Anthony Trollope talks about Iceland; Prof. Proctor has an astronomical paper, and Sainte-Beuve's Critical Method is discussed by an appreciative writer. The Effects of Light on Plants is a paper that will be of interest to all engaged in horticulture; and the RURAL readers number many such. The Races of Asiatic Turkey is a timely contribution, and altogether the Eclectic is an interesting magazine.

BRIC-A-BRAC.

MARY'S LITTLE CORN.

MARY had a little corn
Upon her little toe,
And everywhere that Mary went
The corn was sure to go.
[*Camden Post.*

And to the cooling ocean's shore
It followed her one day:
But the little ache corn was so sore
She couldn't play croquet.
[*Island Review.*

"What makes the corn hurt Mary so?"
The other players cried.
"Because she wears her boots so tight,"
A looker-on replied.
[*Seaside Press.*

"And you a little lump upon
Your toe can grow to suit,
By putting on a 'five' sized foot
A number two sized boot."
[*Boston Traveller.*

And so the doctor dug it out,
Which made poor Mary sob;
And now no corn she knows about
Except what's on the cob.
[*N. Y. Graphic.*

A SINGULAR VENGEANCE UPON AN EXTORTIONATE LANDLORD was recently wreaked by an Englishman who, when traveling in Switzerland, had been charged by an innkeeper ten francs for a basin of *bouillon*. A few days after the landlord received an unpaid letter from another country, simply containing these ways:—"Dear Sir,—Your *bouillon* was good, but somewhat dear." In about a month came a hamper, with every appearance of being filled with unlimited *pates*, but in reality only containing a similar letter, the carriage of course not being defrayed. Then ensued a box, which arrived from the West Indies, labeled "Best Coffee." The landlord, delighted, pays the carriage, but only finds the inevitable epistle. Finally the joke became known, and was repeated at length in the journals, and the unfortunate landlord was compelled to sell out the hotel and to leave, to practice his wiles "in fields and pastures new." It is needless to say that the purchaser at once changed the name of the unfortunate inn.

TWO TRUTHS.

"DARLING," he said, "I never meant
To hurt you," and his eyes grew wet,
I would not hurt you for the world!
Am I to blame if I forget?"

Forgive my selfish tears," she cried,
"Forgive. I knew that it was not
That you would mean to hurt me, love;
I knew it was that you forgot!"

But all the same, deep in her heart
Rankled this thought, and rankles yet;
When love is at its best, one loves
So much that he cannot forget!

ONE Mrs. Van Auken installed a Chinaman in her kitchen. The following conversation took place:

"What is your name, sir?" asked Mrs. Van Auken.

"Oh, my name Ah Sin Foo."

"But I can't remember all that lingo, my man. I'll call you Jimmy."

"Velley welle. Now whachee namee I calle you?" asked Ah Sin, looking up in sweet simplicity.

"Well, my name is Mrs. Van Auken; call me that."

"Oh, me can no 'membel Misso Yanne Auken. Too big piecee namee. I calle you Tommy—Misse-Tommy."

KINKELY, winkely, kangeree,
Jujibi, jujubo, jujjburee,
Yawfully, yofull, yigo yum,
Florium, zorium, buckerabum,
Mufti, pufti, quilty seo,
Jiggelty, wiggelly, parchum pea,
You can't compare with a kalamazoo
Or an agilatorium kangaroo.

NOT ENGLAND'S QUEEN, BUT MINE.

God save my darling one,
Fairest beneath the sun,
God save my queen;
Vainly may ills molest,
Peace reign within her breast;
Ever by heaven blest,
God save my queen.

Beam on her, gentle skies,
Happiness be her prize,
God save my queen;
If clouds about her lower,
Harmless may prove their power
Joy gild each passing hour,
God save my queen.

When time is past and gone,
On angel pinions borne,
God save my queen;
There in yon heaven above,
Home of eternal love,
God bless my cherished dove,
God save my queen.

A CORRESPONDENT writes us as follows:

DEAR RURAL:—You say in your last issue that the word "smile" is the longest in the language, because there is a *mile* between the first and last letters; but here is a longer one, "incontinently." See the area between the first and last syllables.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

OLD LOVES.

TRANSLATION FROM HENRY MURGER.

LOUISE, have you forgotten yet
The corner of the flowery land,
The ancient garden where we met,
My hand that trembled in your hand?
Our lips found words scarce sweet enough,
As low beneath the willow trees
We sat. Have you forgotten, love?
Do you remember, love Louise?

Marie, have you forgotten yet
The loving barter that we made?
The rings we changed, the sun that set,
The woods full filled with sun and shade?
The fountains that were musical
By many an ancient trysting-tree—
Marie, have you forgotten all?
Do you remember, love Marie!

Christine, do you remember yet
Your room with scents and roses gay?
My garret—near the sky 'twas set—
The April hours, the nights of May?
The clear, calm nights, the stars above
That whispered? They were fairest seen
Through no cloud-veil. Remember, love!
Do you remember, love Christine?

Louise is dead, and—well-a-day!
Marie a sadder path has ta'en;
And pale Christine has passed away,
In southern suns to bloom again.
Alas! for one and all of us—
Marie, Louise, Christine forget!
Our bower of love is ruinous,
And I alone remember yet.

THE WOMAN'S CLUB.

TALKS WITH CHILDREN.

As I expect to gain useful information from the "Women's Club," I should like to be of some service, too, but feel diffident about my own ability.

I have noticed that writers in family papers for some time past, have been advising mothers in the country to adopt the Kindergarten system in their families. No one can doubt the benefit of the system, if properly carried out; but in many working families I believe this is simply impossible, for the mother cannot give the proper amount of time to it. There is a plan I followed many years in my own family, and I found it so pleasant and beneficial, that I thought I would suggest it to those who may not have thought of anything of the kind. The idea was suggested to me from noting the pleasure it gave the children at an infant school. I call them "Object Lessons." At home I gave one lesson each week, and often found myself better and brighter at the end of the half hour than when I sat down.

Select any object with which the children are familiar—Bread—Fruit—Iron—Tin—Horse-Hair—Wool—in fact, anything convenient. Have your slate in readiness, and having written the name of the article or object, upon it, ask the children its uses and various qualities—after a little practice I have often had the children find ten or twelve qualities in one object—each quality is set down upon the slate as soon as found, the children helping, as far as they are able, to spell the words. When no more qualities can be found, I question the children as to the meaning of the words written down, explaining what they do not understand. It is a very simple affair when once started, and sometimes the children would find articles and ask me to keep them for the next lesson.

It brings about many pleasant talks between mother and the children, and with the help of one or two of the good, yet cheap illustrated papers that are now so well adapted for family use, the time will pass pleasantly, and the children will learn to prefer instructive books to trashy literature.

M. J. T.

DRESS REFORM, AND TOMATO CATSUP.

EDS. RURAL: I agree with Lillian in regard to "Club" sounding fast, and as we wish to represent a quiet, practical class of women, would it not be well to change the name? "Corner," I think would be appropriate—it is suggestive of a cozy nook where we women get together and compare notes. I have no desire to advocate "Woman's Rights," though I do believe in independent womanhood, a womanhood that enables us to be self-supporting and as unlike a man as possible; and that brings up the question of costumes. I agree with Jacquelina that a change should be made, but where can we find a woman in society brave enough to adopt a sensible costume and wear it on all occasions. I don't wish it to be *a la* Dr. Mary Walker, for she tried to look like a man, but I think there might be a happy medium arrived at between her costume and the fashionable trailing skirts. As for me, I rejoice in calico and I don't think I was ever so comfortable or happy before.

As so many of the sisters are giving recipes, I would like to tell them how I made tomato catsup. I was out transplanting strawberries when I made the discovery that my tomatoes needed attending to. I gathered them (about a half bushel) and decided to make them into catsup. I cut them up, put them on the stove to cook, and as my life has been one that has never taken me into the mysteries of canning and preserving, I put on my hat and wended my way across lots to my nearest neighbor (who by the way is very obliging and saves me the expense of a cook-book), and asked her what I should do next. She very kindly stopped her work and gave directions: first strain, then add sugar, spices, mustard no salt but a little celery seed. I came home feeling that I was fully competent to make catsup. I strained the tomatoes when lo! I had forgotten to ask what quantity of spices to use. So back I went to my very amiable neighbor and succeeded in getting the correct quantity. I came home, finished my catsup, and decided then and there to own a cook-book, for if it was no advantage to me, I would at least be less of a nuisance to my neighbors. I don't like to cook anyhow, I think it is a nuisance. If food would only grow like fruit and berries, I would'nt object to cultivating it from morning 'till night. Truly, I never tire of out-door exercise. I can work among the fruits and flowers all day, and every weed that I pull I feel as though I had conquered an enemy.

The weather is just now delightful. Our lovely harvest moon is just beginning to wane, and the sighing of the winds among the pines reminds us that autumn is here. The other farmers are rejoicing in full crops, but I have reaped a full harvest of experience which I'm sure will be an advantage to me the coming season. The time for our fair is drawing near and if the ladies have to do all the work this year, I'll see to it that the gentleman don't get all the credit

H. B. N.

MUST WIVES CONFINE THEMSELVES TO HOUSEKEEPING?

THE letter in RURAL of 21st Sept., addressed to mothers, is full of excellent suggestions, and it is beside a timely contribution. I notice that the much-discussed question of the proper education for girls, has received a fresh impetus from an article published in the Nation a few weeks ago. The writer of the article in question wants women to be educated to be wives and mothers, and he rehearses all the old arguments; but one of his suggestions is quite novel and somewhat droll. He thinks it should be a part of a girl's educational course to be trained "to receive with equanimity in a faded calico gown, to a dinner of corned-beef and cabbage, the stranger whom a thoughtless husband has brought home unexpectedly to dinner." How delightful it would be to attend a calico—corned-beef rehearsal at a girls' college! I should suggest that the husband be educated to exercise some thought in the matter and not bring home guests at inopportune times; but it is noticeable that, while girls are always recommended to adapt themselves to the supposed wants of their prospective husbands, it is never so much as hinted that tastes and habits likely to add to the comfort or pleasure of the future wife should be developed in the boy.

How many houses would be more comfortable, how many husbands and wives happier, if women would only take a lesson from the young wife Mrs. Harbert writes about. Poetize over it as one will, the ugly fact remains that drudgery about the house tends to impair a woman's health, to diminish her attractiveness, to make her narrow and given to gossiping about the petty cares of her everyday life. If a woman is simply a servant the wear and tear is much less, but when beside housemaid, one has to be nurse, dressmaker, mother and hostess, it is little marvel that the average woman is old and faded at 40. All married women cannot of course teach, but there is usually some one thing they can do well: why not turn that one talent to account and make it the means of adding to the family fund and give over the dull routine of heavy housework to some one who has no ability to do anything else?

I know of a little woman in this city who is a tasteful, rapid sewer, and who, previous to her marriage, was an excellent dressmaker. She was married to a poor man, whose salary was then, and is now, less than twenty dollars a week. Seven children in all have been born to them, three of whom (all boys) are now living—of the folly and criminality of their having a family when so poorly off I shall have nothing to say. As may be imagined, they are not comfortably housed, or clothed, neither can they afford nutritious food. A friend suggested a few years ago, that as the children were all older than seven years, and attended school, the mother might "hang out her shingle" and establish herself as a dressmaker. The husband was outraged at the idea of his wife working "for her living," and so she continues to this day at the dreary round of housework, working beyond her strength, wearing shabby clothes, eating the poorest quality of food, and living in a pestilential neighborhood—because they are really too poor to afford to breathe pure air—and, worse than all, her eldest son a youth of eighteen, has been compelled to leave college, and is wasting his young life in the sub-cellar of a large wholesale dry-goods house for the merest pittance. Has this woman done the best that she could for herself, her children and her husband?

ELLEN HUNTER.

SOME OBJECTIONS TO "A LETTER TO YOUNG MOTHERS."

IN the RURAL of the 21st inst. there appeared an article addressed to mothers. I do not think it will have a good effect at all on young women. The lady whose letter was quoted says that housework was distasteful to her. Very few women do like to wash greasy dishes or cook in a hot kitchen, but they have to do it, nevertheless. I do not like it myself, but I believe it is woman's duty to be a good housekeeper. I do not mean she should know nothing beyond how to keep house. A good wife and mother needs the best education in the world. By all means let the women receive a good education, but let them be accomplished housewives as well.

The writer referred to tells how she engaged a girl to work for her, and gave music lessons herself. So far, well and good; but how many women are really competent to teach music? Not one in a dozen, perhaps.

Mrs. Harbert says that if a girl shows talent for designing, art or literature, no encouragement is given her. I think that is a mistake. Look at the number of women artists, poets and authors there are. As for women in the pulpit, I will only quote from the Bible—the highest authority on the question. St. Paul says: "Let your women keep silence in the churches."

As we have in the United States to-day women doctors, lawyers, telegraph operators, engravers, artists, poets, authors, editors and lecturers, I think women cannot complain of being kept down by those "tyrannies of custom" Mrs. Harbert so pathetically alludes to.

SAIREY GAMP.

THE WAIL OF A COUNTRY BOARDER.

I DON'T know that I am justly entitled to share in the benefits of the Club. I am, at present, one of that large class known as country boarders, and I have not the most overwhelming respect for my entertainers (for which entertainment I pay a round sum). I suppose myself and my class are the legitimate objects of extortion, but I do not know that because one is in sore need of leeching, leeches themselves are any the pleasanter. We were decoyed into the land of Goshen by fair promises. We panted for shady bowers, milk, chickens, fruit, eggs, and pastoral loveliness generally. But we got only the latter. I suppose I should warn the "Club" that I join merely for the luxury of a social grumble. I must tell somebody how I have been put upon, or expire! The idea! We pay twenty dollars per week for a fine prospect, and semi-starvation. When strawberries were ripe and plentiful, and we were counting on a feast of this luscious fruit, we barely had a taste, but were graciously allowed to *look at* the boxes upon boxes that were sent to market. I hope they sold for a song! And pork! I have had to eat enough to become possessed of an evil spirit,—and I'm in no hurry to have it cast out, at least not until I have relieved my feelings before the Club.

I think I could have submitted to all this, bad as it is, but to have one's new hat (a real love!) copied by the village Amaryllis, and then to have this frightful caricature appear in church contemporaneously with its prototype, is too much for feminine good nature. Altogether I hate the country; but I shall take the RURAL with me back to the city, as it was the only good thing, excepting the scenery, I enjoyed.

MRS. JAMES PRICE.

A PROTEST AGAINST DISH-WASHING.

YES, decidedly I shall join the Club, and indulge in a real good howl. Wonder why some one did not think of such a perfectly splendid escape-valve before. I have often wanted to "talk back," but never until now had just the opportunity I coveted.

My grievance is simple. I hate dish-washing. It is beyond everything repugnant to me after I have eaten a satisfactory dinner to rush i' th' imminent breach, grapple with a slimy, finger-eluding, dish-cloth, and proceed to demonstrate that tiresome fact that grease has an affinity for soap. Why cannot a patent dish-washer be invented, or why cannot the men be inducted into the business? If any one thing is calculated to make me regret that Herod confined his attentions to the male children of one feeble race, it is the picture of contentment in trowsers sitting behind an interesting book, and smoking a fragrant cigar while I am bending over the repuguant task. I become quite cannibalistic in feeling, and I'm sure the crockery suffers, else why should the lord and master look up with the mild-eyed wonder of a contented bovine and lazily drawl, "My dear, is it really necessary to make quite so much noise?" Heavens! I feel in a frame of mind equal to an atrocity. My only consolation is in the thought that Horatio will have to make the fire in the morning!

I am ready to make one of a society for the encouragement of a plan to abolish dish-washing, by the substitution of fig-leaves, bark, or paper dishes, or any other make-shift for crockery that can be sent to smash after having been once used, so that we may always use new material, and never have to wash a dish! Pots I will *not* wash: Horatio has to do them!

A SUFFERER.

AN "EDUCATIONAL" SUGGESTION.

I THINK the Club is a good idea, and it will be our fault if we do not make it our chief delight during the long winter evenings. I think it should be more or less educational in its scope, and Miss Ripley could aid us in shaping it to that end by suggesting some instructive topic, say a course of reading. Is a course of reading a topic, though? I know about what I would like to have, but am not sure I am ready enough with the pen to state it clearly. In fact, I am not good at writing at all; I can make butter, however, with the next one, and it is just because I am too familiar with the churn, that I want to churn up my ideas, and feel that there is something in life besides the mere satisfaction of material wants. Let us see if by discussion we cannot improve the social aspects of farm life.

JULIA B. A.

WANTED, TO EXCHANGE.

I HAVE for exchange designs and directions for fretwork in perforated card, worth $1; also fine garden flowers—Chrysanthemums, Phlox, blue and white Myrtles, herbaceous Spiræas, Physostegia, &c., &c.—beside many of our splendid wild plants,—Ferns, white and blue Violets, Burning Bush. My wants are: a pair of neatly-worked pillow shams, a tasteful cotton chair tidy, the poems of L. E. L. or the works of Dickens—in a readable condition. Will guarantee the senders full satisfaction. Address, for a few weeks,

M. M. B——,
Sycamore Dale, W. Va.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SOME DINING TABLE TALK.

MARY WAGER-FISHER.

"Smothering" Chicken.

THERE are ways and ways of cooking chicken, but for simplicity and deliciousness, I know of no method so good as the "smothering" mode. This, of course, for a tender fowl not over five or six months old.

First, catch your chicken. This should be done the night before; put it in a coop or barrel, and the morning will find it with an empty crop. The more fastidious way of cooping the fowl several days for cleansing purposes, is not always expedient; while to catch, kill, pluck, and have a chicken in the pot within an hour's time, is a haste that is both unseemly and disgusting. After the chicken is picked, singed and the entrails removed through an opening only large enough for so doing, wash clean, and place in a cool room until within one hour and a half to two hours prior to the dinner hour, as it requires that length of time to cook it. The exact time depends upon the size of the fowl and the heat of the oven. Lay out, on a board or dish, a tablespoonful of salt, with which rub the outside and inside of the chicken; add a little pepper. Butter two large soda crackers, put butter sides together, and place them inside the chicken; joint the legs and wings by cutting the joints on the top; press the chicken snugly together, lay on one side, put the gizzard, heart and liver with it in the dish (which should be a bake-pan or basin, having a close-fitting cover), add some hot water—half a coffee-cupful say—put in the oven tightly covered, and bake for half an hour; then remove the cover, return to the oven until one side of the chicken is nicely browned, then turn it over and brown the other side likewise; add more hot water, replace the cover, and leave it in the oven until done. Then place the fowl on a platter and thicken the gravy in the bake-pan with a little flour and cream; season to taste.

A poor substitute for the soda crackers, are water crackers, or bread. For a hasty luncheon, a small and tender chicken may be so prepared in an hour's time—if the oven is hot enough—and be so delicious, that the happy devourer of it will think it the most palatable dish in the world, and return thanks at the close of the meal, which would appear to be the most fitting time at all times for grace-saying.

Breakfast Dishes.

OAT-MEAL we are very fond of at "our house," and latterly have been using the Ohio oat-meal, with complete satisfaction. It costs but five cents a pound, in five-pound packages, and a package will last a long time. It is clean, very sweet, and when cooked, is free from the "stringiness" that frequently affects Irish oat-meal, especially if it is undercooked. It is easily prepared for breakfast, is so nutritious and healthful—all children ought to have it—that I urge its use upon all country housewives who are yet strangers to it. It is made precisely like any "mush," is better hot than cold, and may be eaten with a little sugar and milk, if one prefers the addition. Irish cooks, who have learned how to prepare it in Ireland, have always cooked it for me very nicely. I find that while these simple breakfast dishes are, and have been for years, constant dishes on the tables of city homes, very many farmers do not use them, but depend, as of yore, upon fried meat, fried potatoes, and griddle cakes. To such let me say, "try oat-meal! A little careful practice in cooking it, will readily lead to perfection, and you will soon wonder how you ever breakfasted so long without it."

BOILED CRACKED WHEAT is an unsurpassed breakfast dish, if *rightly cooked.* Every thing depends upon that. It is more economical for farmerines to use their own wheat, than to buy the prepared article. After the wheat is cleaned and dried, it may be coarsely ground in a coffee-mill. This also is made like a "mush," but should be cooked fully as long as corn mush—from two to four hours. It requires frequent stirring to be kept from burning. When done, fill a dozen—or less—tea-cups rather more than half full of the "mush;" let stand until cold; turn out of the molds, carefully, into dessert plates, or arrange all on a platter, which may be placed on the table, and served from that as desired. Eat with a sauce of sugar and cream. Delicious! Of course, all mushes require a seasoning of salt, while being cooked. Wheat, so prepared, forms also a nice dessert for dinner. A slice of jelly, served with it, adds to its delicacy, for some palates.

THE IMPORTANCE OF BREAKFAST is so great that of all the meals or the day I think it should receive special attention. It is, in a way, the key of the day. If it is fresh, wholesome, nicely cooked and served, it gives one a "push-off" for the day, that is full of vigor and good cheer. If it is dowdy, mussy and indigestible, it spoils the day, and one goes about work much as if a weight were tied to his heels. If one has fruit, it should always be on the breakfast table. You know the old Spanish proverb:

"FRUIT is gold in the morning, silver at noon and lead at night."

A plate of fine apples always exhales a fresh and wholesome atmosphere, and baked, stewed or uncooked, they are capital to begin a breakfast on.

CHOICE TOMATOES AND FANCY BEETS.

WE never had such fine and smooth tomatoes as this season affords from seed received last spring from the editor of the "Rural."

The Golden Trophy and Little Gem are greatly valued, while the Acme is indeed as near perfection as it is possible for a tomato to be. No matter how they are cooked, the usual remark among our friends at table is, "What a fine flavor your tomatoes have!"

I copy my recipe for catsup, which has been a success in the family for 16 years, and which, if faithfully followed, cannot possibly fail: For one gallon peeled tomatoes, one quart of vinegar, three tablespoonfuls of salt, three of ground pepper, half an ounce of ground allspice, three tablespoonfuls ground mustard, four red pepper-pods. Simmer slowly three or four hours, being careful not to scorch it; stir constantly; strain through a wire sieve. Put into common bottles; cork and seal.

Beets.

Our fancy beets are very much admired, and for them we have to thank the RURAL. They are quite an addition to a "foliage" bed, and we often smile as visitors pause and, after admiring the beautiful veined stems, say,—"They look a little like *beets*." The tender stems, stripped to the mid-rib and cooked like asparagus, are quite palatable. But we value them most for being a new sort of ornamental plant that is as yet rarely seen. ANNIE L. JACK.

DOMESTIC RECIPES.

To Make French Rolls.

After the dough has risen it may be made into many ways. By taking off a part and beating up an egg, and working it in with a little butter, you may have nice French rolls; just use flour enough to handle them well, dip your hand in the flour, and flour round the sides to make them break apart nicely; make off quickly, put close together and allow no room for them, or any other rolls, to run and get out of shape. When nearly done, wipe the tops over with milk without taking them from the stove.

ANOTHER WAY: Take a piece of dough the size of a loaf, beat two eggs light, half cup of milk, small spoonful of butter, and with the hand work altogether in a stiff batter; grease a pan (a round one is best), pour in an inch and a half thick, and bake in moderate oven till well done; split and butter; send to table hot. It should rise twice its original thickness. By adding a little more of the above ingredients, with a cup of sugar, and giving it a second rise before baking, you have a very good plain cake, especially for children.

Very Nice Fritters

may be made by simply rolling the plain dough (after it has risen, of course) and cutting and frying as doughnuts, to be eaten with syrup or sauce. By putting a lump of risen dough into a pudding-bag, tying, leaving room to swell, putting into a pot of boiling water, and boiling an hour or more, according to size, you have an excellent plain pudding, but it should be eaten with rich sauce.

News of the Week.

Monday, Sept. 30, 1878.

POLITICAL.

Indications all over the country show that there is a powerful disintegrating force at work breaking up the old political parties. It is widely felt that the issues on which they were founded are things of the past, and that they must either take vigorously in hand the live questions of the day or give place to other organizations specially formed to decide upon these issues. Of these, by far the most urgent and important is the financial question. This will not brook delay. The great strength the new greenback-labor party has unexpectedly displayed forces the old parties to take a decided stand in the matter. This is by no means an easy task, for prominent members of each of these old parties are directly at variance on the question. This difference of opinion is far more marked in the democratic camp than among the republicans, and, however pertinaciously the former may desire to cling to their time-honored name, it is hard to see how it can include men so diametrically opposed on this all-important matter as are such leaders as Tilden, Hewitt, Bayard and Lamar on on one side, and Thurman, Ewing, Voorhees and Bland on the other. These are so broadly at variance that it seems impossible they should work together. On secondary questions, of course, a compromise might be effected, but this is scarcely possible in the present instance. Hence the necessity for a distinctive greenback party to carry out a greenback platform and draw from each of the old parties those who favor "soft" money. Of these, most come from the democrats, while daily it is becoming more evident that to preserve its very existence the republican party must take the other side of the question and become the "hard"-money party.

On Wednesday last the Democratic Convention of this State met at Syracuse. The two chief factions were the Tilden-Robinson-anti-Tammany and the Tammany. The fight between them was bitter, and at one time the former withdrew from the Hall, and there was a prospect of a "bolt." John Kelly, the successor of Tweed as Tammany "boss," had secured the preliminary organization of the meeting in his own interests, and accordingly through the rulings of Laning, temporary chairman, Tammany won a solid triumph. Gov. Robinson was indorsed, a "hard" money platform adopted, and the republican party vigorously arraigned. Much discontent was expressed at the wholly partisan nature of many of the rulings made by Laning.

On Thursday the New York State Republican Convention met at Saratoga. The Conklingites were so vastly in the majority that their opponents thought it prudent to venture no opposition. Conkling made a vigorous hard-money speech, recapitulating in a forcible manner the arguments which have already been often urged in support of such views. The platform strongly supported "hard" money, a speedy return to a specie basis, and free elections—South as well as North. The democrats were, of course, bitterly arraigned; and while the action of the Electoral Commission was endorsed, not a word for or against the present administration was said. G. W. Curtis, while stoutly proclaiming himself an adherent of President Hayes, strongly approved of the platform, and made a very eloquent speech in favor of that and of the harmony Conkling had already advocated. On the whole, the meeting was a dignified, courteous, and harmonious gathering. Geo. F. Danforth, of Monroe, was nominated for Judge of the Court of Appeals, the chief office for which elections are to be held this year.

The anti-Butler democrats of Massachusetts met on Wednesday at Faneuil Hall, Boston, as per agreement. The assembly did not consist merely of the 500 bolters from Worcester, but of between 1,200 and 1,300 delegates, most of whom had been elected to supply the places of the supporters of Butler at Worcester, who, of course, did not put in an appearance at Boston. Judge Abbott was nominated for Governor by acclamation, and the whole ticket is strong and highly respectable. There is no prospect—no possibility indeed—of the election of the ticket, but it is hoped that the democratic organization in the State may thus be kept up, and that this action may help materially to defeat Butler. The latter, meanwhile, expresses himself confident, and is working like a Trojan to secure success.

MISCELLANEOUS.

President Hayes got back to Washington last Wednesday from his western tour. He was well received pretty nearly everywhere on the road. The new democratic Senator from Oregon, James H. Slater, is a native of Illinois, 52 years old, a lawyer, of course, and an ex-Congressman. Heavy frosts are reported from Eastern Massachusetts, Western and Southern Vermont, and portions of Connecticut, New Hampshire, Maine and New York. Vegetation has suffered but little. That permanent exhibition at Philadelphia has, within the year, reduced its debt from $273,500 to $43,900, with improving prospects for the future. Addison H. Laflin, Congressman in the 39th, 40th and 41st Congress, and Naval Officer at this port under Gen. Grant, committed suicide at Pittsfield, Mass., on Tuesday last; poor health and a morbid fear of poverty are assigned as motives for the deed. The Treasury authorities expect that a million and a half silver dollars will be placed in circulation monthly by the present system of transmitting them free of charge to points where there is a demand for them. Once more we are assured from all sides that business is recovering and prospects brightening—but the story is becoming a trifle stale and perhaps untrustworthy.

The' Allen, a greenback-labor leader of this city, a notorious gambler, member of a family every one of whom is a jail-bird, last week shot and killed an associate named Malloy. No one was present at the event except the principals. Allen surrendered himself, claimed that it was an accident and expressed much sorrow. A coroner's jury believed his statement and all except one brought in a verdict of accidental death. Allen was put under $1000 bail, furnished by the notorious Harry Hill. On Thursday the Nationals of this district held a meeting to vindicate the gambler, and received him back joyfully as their leader.

The Mexican government is sending 5,000 regular troops to the Rio Grande frontier to put an end to the raiding of "greasers" into Texas. There was a report that the movement was designed to check the pursuit, by U. S. troops, of cattle thieves who might cross into Mexico; but Diaz emphatically contradicts this rumor. Although recent attempts to upset the present Mexican government have all failed, it is said there is much discontent across the border, as money is so very scarce that the troops have not been paid for months, and discontent among the troops in Mexico means a revolution. On Monday evening last, while testimony was being taken at Marquette Michigan in the income tax suit of the United States against Mr. Tilden, a number of books relating to the accounts of mines in that neighborhood in which the defendant was interested, were taken from the court-room. Mr. Harlan, one of Tilden's lawyers placed the books on a chair near the door, when suddenly a man entered picked up the books, rushed out with them, jumped into a vehicle a confederate had ready, and disappeared. It is said the books showed that the Great Reformer's income from the mines was much heavier than was thought possible, and despite the theft of the inculpating books, the goverment officers say they expect a verdict On last Thursday Harlan, Tilden's lawyer, was arrested at Detroit on the charge of being an accomplice in the robbery, but was released on $10,000 bail. Ill-natured people—and perhaps a few others—hint that Uncle Samuel knows more about the rascality than it would be wise to tell—but then you know how people *will* talk, especially as the crime tends to benefit the statesman of Gramarcy Park—not a little.

The boat race between Courtney and Hanlan for the championship of America and a purse of $5,000 raised in Toronto, comes off next Wednesday. Both men are reported in excellent condition, confident of success, but discontented with the race course at Lachine, near Montreal, on account of its eddies. In his farewell speech, Lord Dufferin has very forcibly urged upon the Canadians the heinousness of religious faction fights and the absolute necessity for the future prosperity of the country, that Old-Country animosities should be buried in the Atlantic by those crossing over to this continent. The advice is timely and excellent—but the fanatics who in the name of religion violate the commands of the Saviour, are not very likely to be influenced by the words even of so popular a governor-general as Lord Dufferin. During the week there have been serious labor troubles at Washington. A Jewish demagogue named Cohen, at the head of a riotous rabble visited various places where men were at work in the city; forced those getting less than $1.50 a day to strike, and threatened to attack the government buildings. The police, however, vigorously attacked the mob and dispersed it. The government, nevertheless, as a precaution has armed the treasury clerks with revolvers of the heaviest caliber, to be kept at hand in their desks, so as to be prepared to aid in defending the building in case of emergency.

The ravages of yellow fever still continue in the South, the number of deaths being nearly as heavy as at any time during the continuance of the pestilence. In New Orleans there were yesterday 468 new cases against 410 on Saturday. The number of deaths was 52, a decrease of three from the previous day. In Memphis 32 deaths were officially reported for yesterday; nine in Vicksburgh, and a large number of others in smaller towns.

Condon and Melody, two Fenians, for the last eleven years held as prisoners in England, and recently released at the request of Mr. Welsh, our Minister to Great Britain, arrived in this city yesterday morning, and were enthusiastically greeted by a multitude of their compatriots. They are both, but especially the younger man, Melody, prematurely aged by the hardships they have undergone, herded together along with the vilest criminals, though their offense was certainly of a political nature.

FOREIGN.

San Domingo has just had another revolution. President Gonzalez has capitulated and left for the island of Curacoa; the triumphant revolutionists have entered the city of San Domingo and organized a provisional government, with Jacinto de Castro for temporary president. They have yellow fever raging over there also. Crops are said to be fair in Russia and Italy, good in Holland, England and Spain, and very fine in parts of Turkey. Dr. Petermann, the celebrated German geographer, died on Friday of apoplexy. The result of the late elections in Canada show a complete victory for the "outs." The government had a majority of sixty in the last Parliament, the opposition will have more than that number in the present. Besides the cry for protection of home manufactures, a great deal of effect was also produced by the general commercial depression, which everywhere seems to beget a desire for a change.

It is not at all unlikely that England will soon have on her hands a war with Afghanistan. Some time ago Lord Lytton, Governor-general of British India, wrote to Sher Ali, Ameer of Cabul, a couple of friendly letters which that potentate contemptuously neglected to answer. Later still Sir Neville Chamberlain was appointed envoy to the court of Cabul, but the Ameer refused him permission to advance, and sent a heavy force to block up the Sujah Pass, the route by which the embassy would have to travel. This is an insult which neither the home government of Great Britain nor that of India can put up with. Accordingly, unless the Ameer soon apologizes war will be declared by the Indian government. Already 10,000 water-proof sheets and 5,000 blankets have been sent towards the frontier, and troops are moving from all sides in the same direction. The Ameer was some time ago greatly encouraged in his present course by Russia, which has an ambassador at his court, and was anxious to embroil him with England in view of the war which was then imminent between the Lion and the Bear. The Czar, however, disclaims any agency in the present complications.

Afghanistan is probably the most powerful Mahommedan Power in Asia, next to Asiatic Turkey. It has an area of about 215,000 square miles, and a population estimated at from 5,000,000 to 9,000,000. HERMAN.

VARIOUS.

Grasshoppers in some parts of Nebraska destroyed the vegetables.

Nearly all the British East Indian troops have been sent home from Cyprus.

An unusually large amount of apple brandy will be made in Indiana this year.

Cattle dealers along the line of the Kansas Pacific are not anxious to ship their cattle at present prices.

Turkish refugees in the Rhodope Mountains live principally on soup made of refuse bones and watermelon rind.

A Nebraska farmer reports 600 pounds of bright sugar and 153 gallons of nice syrup from two acres of early sorghum.

A new phase of the hog cholera has broken out in portions of Sangamon county, Ill. The afflicted animals first become blind without any premonitory symptons.

Peaches in the South Haven region are only about half an average crop, but the quality is superior, and prices twice as large. In western Allegan, also, the same state of facts is reported.

Twenty-five thousand Russian medals have been sent to Bucharest for the Roumanian troops who were around Plevna. This figure, therefore, represents the number of survivors of the campaign in the Roumanian army which crossed the Danube.

The Ohio State Fair in Cleveland was kept open on Sunday for the benefit of the yellow fever sufferers, and the preachers of the city generally denounced the action. The relief committee in Chicago declined money taken in at a spiritualistic seance.

A Georgian returned to his home after an absence of two weeks. His eight-year old son loudly welcomed him. "Is everybody well, Willie?" the father asked. "The wellest kind," the boy replied. "And nothing has happened?" "Nothing at all. I've been good, Jennie's all right, and I never saw ma behave as well as she has this time."

A Georgia farmer bought a grand piano for his daughter. His house is small, and, to economize room, the lower part of the partition between the kitchen and the parlor was cut out, and the long end of the piano stuck through. Priscilla now sits at the keyboard, singing, "Who will care for mother now?" and the mother rolls out doughnuts on the other end of the piano in the kitchen.

Mexico has gone into the cattle exporting business. Four hundred and fifty-two head of cattle were landed at Havana on Aug. 9, from Alvarado, Mexico. Meanwhile the export trade between Florida and Cuba is flourishing. There are now five American and two Spanish schooners, and one American and one Spanish steamship constantly engaged in the cattle trade between south Florida and Havana.

The horses on the Philadelphia railways are not fed with oats, chopped corn and hay being found to be more desirable fodder. They fatten more rapidly on this food, which it is said gives them greater strength and endurance than any other. The cost, too, of corn is much less than oats. Fifty years ago the principal food for work horses was cut straw and bran, mixed and moistened, with the addition of corn in the ear.

Life is rather too cheap for comfort out in Illinois. The records show that within the last twenty years 314 murderers have been sent to the State prison—90 of them for life and the remainder for from one to twenty-five years. One hundred have been pardoned, 62 have been released in other ways, 21 have died or gone to asylums for the insane, and 131 are still in prison. Three years and six months, it is estimated, is the average term for a convicted murderer in Illinois.

The Mexican government has contracted with a capitalist for the colonization of government lands by immigrants from the Canaries. The government pays eighty dollars for every immigrant of twelve years and more, and forty dollars for children under twelve years. As soon as the immigrants are established on the lands assigned them, the said amounts will be paid by the Vera Cruz custom house, being the nearest to the settlement. Another contract has been concluded for the colonization of European immigrants on the government lands of "Mesa de Coroneles," fifty dollars being paid for each immigrant over four years of age, the contracts to last for ten years.

A Virginian writes in praise of corn not only as the best food for laboring men but for domestic animals of all kinds. He states that the usual rations for a negro laborer, for a week, is one and a half pecks of corn, three pounds of bacon, and a little molasses. They thrive on it and are healthy and strong. Southern horses and mules, as a rule, have only corn for grain, but they live longer and do more work than northern horses that feed on oats. In his part of the country dogs are fed almost exclusively on corn-meal, and they not unfrequently eat corn in the ear, while wandering curs devour it on the stalk. Even cats eat corn-meal stirred up with water, as is done in the case of chicken feed.

BEST THREAD FOR SEWING MACHINES.

The Jurors at the Paris Exposition agree with the Judges at the Centennial, and decide that it is the "Willimantic."

It appears from the Associated Press dispatches and from the lists of awards published in the Paris newspapers, that the jury on cotton textiles, yarns and thread at the Universal Exposition, have singled out the WILLIMANTIC COMPANY of Hartford, Conn., for a special distinction. They have decreed to that Company a *gold medal and the grand prize* for "*Spool Cotton especially adapted for use on Sewing Machines.*" Out of more than 50,000 medals and awards, there were only 100 grand prizes, and, although all the great thread manufacturers of the world competed, the WILLIMANTIC COMPANY alone receives the grand prize for Spool Cotton. This action of the Paris jury agrees with the opinion of the Judges at our Centennial Exposition, who decreed a medal, and strongly commended the Willimantic thread for its surpassing excellence. But perhaps the most significant indorsement of this Spool Cotton is that by the sewing-machine manufacturers and operators themselves. More than fifty of them, after having used the Willimantic thread on their machines during the Philadelphia and Paris Expositions, on all kinds of work, have signed certificates declaring that the WILLIMANTIC is the "*best thread they have ever used on sewing machines, on account of its strength, evenness, elasticity, finish and beautiful shades of color.*" The concurrent opinion of so many experts ought no longer to leave any room for doubt as to which thread is the best for sewing machines. It is not of British or foreign manufacture, but an American product, and made at the Willimantic Mills.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 23, 1878

BEANS AND PEAS.—With a light present stock of all kinds of beans, quotations are unsettled. New mediums, $1 65@1 70; old $1 55@1 60; new marrows, $1 70@1 75; old, $1 52½@1 55; new peas, $1 70@1 75; white kidney, $1 70@1 75; red kidneys have declined to a range of $2@2 50; black beans, $2 named. Green peas, $1 35; Southern B. E. peas, $3 per 2 bush. bag; Canadian peas in bulk and bond, 78@80c.

Receipts of beans, for week, 5,416 bush. Exports, 1,050 bbls.

BUTTER.—There has been quite a buoyant feeling since our last and prices have worked up to a comparatively strong scale. The demand as before is for fine to fancy table, and the deliveries include more attractive grades than for some time past. Much depends upon the amount of fall stock to come as to whether the new prices will be supported for State. Western is steady, and the average of prices is more satisfactory than they have been for several weeks. A few dairies with tubs in are showing; but most of these lines are firkins or Welsh as yet.

Dairy, pails, choice, 23@24c.; fair to prime, 17@22c. poor, 13@14c.; State, half-tubs, choice, 23@23c.; fair to prime, 17@21c.; poor, 13@14c.; entire dairies, 20@21c.; firkins, 18@20c.; Welsh, tubs, choice, 20@22c.; good to prime, 17@19c.; poor, 13@14c.; creamery, selected, 26@27c.; other, 23@25c.; Ohio and State, sweet, cream, 22@24c.; Western creamery, choice, 25@25c.; poor to prime, 19@22c.; Western dairy, choice, 17@18c.; other, 11@15c.; Western factory, ladle packed, 10@13c.; milled and common, 7@10c.

Receipts for the week, 38,030 pkgs.; exports, 3,908 pkgs.

BEESWAX.—There has been a meager business but prices steady; Western and Southern quoted 27@28c. Exports past week, 2,291 lbs.

CHEESE.—There have been taken 43,900 boxes this week by shippers. The demand has been almost entirely for fancy lots, and an advance of about ½c. has been made for these. The limited quantity of September make received had been pretty well engaged, and up to 9¾c. made for them. The late made August have gone at 9@9¼c. Leaving these lots there has been an irregular market. Good and lower grades are especially plenty, and shippers disinclined to take them materially.

Quotations are: 9¾c. for Fancy September, and 9@9½c. for August make; 7½@8¼c. for good and prime; 6@7c. for fair to good; 5@6¼c. for half-skimmed; 3@5c. for skimmed. State, farm dairy at 7½@8¼c. for good to choice, 6@7½c. for fair to good, and 3@5c. for poor skimmed. Wisconsin factory fine to fancy, 8½@8¾c.; do. good to prime, 7@8c.; do. fair to good, 6@7c.; Western factory fine, full cream, cheddar, 8½@8¾c.; do. fine, full cream, flat, 8½@8¾c.; do. good to prime, 6½@7½c.; do. half skimmed, 5@6c.; do. full skimmed, 3@5c.

Receipts for week, 91,135 boxes.

Gold closes at 100¾.

Liverpool cable quotation, 43s.

COTTON.—Large arrivals, a heavy movement forward at Southern points, lower English markets, and a tame export and spinning demand have caused lower prices. Latest prices are: for September, 10.82@10.83c.; October, 10.84@10.85c.; November, 10.75@10.76c.; December, 10.75c.; January, 10.79c.; February, 10.86@10.87c.; March, 10.95@10.96c.; April, 11.03@11.05c.; May, 11.13@11.15c.; June, 11.18@11.20c.; July, 11.23@11.26.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

CORN MEAL.—Is selling at $2.90@2.95 for Brandywine, and $2 50@2.75 for yellow Western.

BUCKWHEAT FLOUR.—Small lots of new arriving are being placed at $2.10@2.50.

FEED.—Sales of 40 lbs. at $13.50@14.50; 50 lbs. at $14@15; 60 lbs. at $14.50@15.50; 80 lbs. at $15.50@17; 100 lbs. at $18@20.

FLOUR.—Winter wheat grades of the new crop continue to arrive largely in excess of trade wants, and they are freely offered at concessions. Spring wheat stock has scarcely varied, having but little attention.

Latest sales are $3.60@4.00 for inferior to fancy superfine State; $4@4.20 for poor to good extra do., odd lots and lines; $4.20@4.45 for good to choice do., strictly choice and fancy lots above this; $3.35@4.00 for very poor to fancy superfine Indiana, Iowa, Michigan, Ohio, &c.; $4.00@4.20 for inferior to good shipping extra do. and $4.20@4.45 for good to choice extra do.; common to about choice white wheat extras, $4.15@5.25; choice to about fancy do. at $5.30@6.00; red and amber winter wheat, inferior to choice trade and family at $4.00@5.40; round hoop Ohio at $4.00@4.25, and trade and family brands of do. at $4.25@5.00, the latter rate for very choice. St. Louis, $4.10@4.90 for very poor to good extra, and $4.90@6 for good to very fancy; Minnesota clear, very inferior to very choice at $4@5.75. Minnesota "straight," inferior to very fancy at $5@6.75 and patent fair to strictly fancy at $6 25@8.25; unsound stock at from $2.00@5.00; city mill extra at $5 00@5.15 for West Indies (the latter rate for strictly choice in new packages); do. for England, 4@$4.10; do. trade and family extras, $5.50@6 50; do. for South America, $5.25@5 85 for fair to fancy; No. 2 at $2.60@3.50 for inferior to very fancy.

DRIED FRUITS.—In apples there are small lots of choice taken at full prices, but quarters accumulate and are hard to sell. Peeled peaches are in fair supply and the lower grades are easy in price. Small fruits hold steady.

New blackberries are quoted at 5½c. Peaches—Peeled, new Georgia, 5c. for poor, 7½@9c. for fair to good, and 9@9½c. for prime; choice North Carolina, 11@12c.; good do., 9@10c.; unpeeled new halves, 4c.; quarters, 3½c. Pitted cherries, 15@15½c.; southern plums, new, 11@12c. Apples—Old State quarters, 2½@3c.; do., sliced, prime, 4½c.; do., good, 3½@4c. New apples 3@3½c. for Southern quarters in bbls.; 4½@5½c. for prime sliced, and 6@7c. for fancy. New raspberries, 23@24c., and evaporated, 25@26c.

Exports past week 164 bbls. dried apples.

EGGS.—Receipts for week, 4,839 bbls.; do. last week, 6,461 do. Light receipts and cool weather have advanced prices and the market is pretty clear of stock. Near points, 22@23c.; State and Penn., 21½@22c.; Western and Canadian, 20½@21c. Limed have some inquiry at 16@17c. for stock strictly choice; other has no sale.

ESSENTIAL OILS.—Price for peppermint uncertain; crop heavy and much carried over from last year.

FRESH FRUITS.—Notwithstanding the cheapness of apples the exports are far below last year. There is a decided improvement in quality, and prices are better than for several weeks past. Selected and high-colored table stock, $1.75@2 bbl.; good, $1.50; mixed, $1.25@1.50; common, 75c.@$1 00; seckle pears, choice, $9@10; common sickles, B. Diel, Louise bonne, Duchess and Buffum, $4@5; Virgalieu have a wide range, $3@7; B. Bosc and Sheldon, $5@7; cooking, $2.50@3.50. Plums are scarce. Damson's $8 bbl.; Copper plums, half bush. crate, $2@2.50. Grapes are selling well. State Delawares, small boxes, $4@4.75 per case; Up-River Concords do., $2@2.50; State do., $1.50@3.25. Loose Del., 7@9c.; do. Concords, 4@7c. California pears expected next week. Boston Bartletts, $3.50@5.50 box. Peaches make a small showing, fancy Up-river, $3@4 basket; poor to good, $1.25@2.50. Cranberries are in stock. Eastern bbls., choice, $8; other, $5.50@7.50; N. J., bbl., $6@7; crates, $1.50@2.25 Watermelons, prime, $15@25 per 100; common, $8@10; nutmegs, $1.50@2.25. New hickory nuts quoted at $2 bush; do. chestnuts, $10@12. Peanuts, prime, at $1.50@1.75; hand-picked, good to fancy, $1.20@1.35.

Exports of apples, past week, 4,293 bbls.; since Jan. 1st, 19,300 do.; same time last year, 64,500.

GRAIN.—For wheat there has been a feverish and irregular market, fluctuating as the advices from abroad were favorable or otherwise, but closing firm. That the business has been active is shown in the export statement, which covers fully 2 100,000 bushels for continent and English markets.

Latest sales are of white State at $1.13@1.13¼; extra white, $1.14; No. 2 white at $1.08½@1.09; No. 3 white at $1.06; No. 1 white at $1.11½@1.12; ungraded white at $1 05@1.13½; No. 1 red at $1.07½; No. 2 red at $1.07@1.07½; do. steamer grade at $1.05½@1.05½; No. 3 red at $1.03; do. steamer grade at $1.03; ungraded red at 95c. @$1.07; No. 2 amber, at $1.05½@1.06; do. steamer grade at $1.03@1.03½; ungraded amber at $1.02@1.07½; No. 2 spring, at $1.02½@1.02½; No. 3 spring at 90c.; ungraded spring at 95c.; No. 1 white, deliveries in October, at $1.11½c.; do. delivery Oct. 25 to Nov. 15, at $1.12; No. 2 red, September option, at 1.03¾; do October option, at $1.07@1.07½; do. November option, at $1.06@1.06¾; No 2 amber, September option, at $1.05½@1.05¾; do. October option, at $1 05½@1.05¾; do. delivery by Oct 20, at $1.05¾; red Canada, in bond, to arrive, $1 03 New York No. 2 spring, September option, at $1.02½; do. October option, at $1.01½; do. November option, at $1.02¾. Rye at 58c. for No. 2 Western and 60@61½c. for State. Barley at $1.19@1.23 for six-rowed State. Corn has been active, but variable in price; latest sales are at steamer mixed, at 49@49½c; ungraded mixed at 48¾@50c.; New York No. 2 at 49½@50c.; No. 2 white at 53¾c.; New York No. 2, Sept. option, at 49¾@50c.; do. Oct. option, at 49¾@50c.; do. Nov. option, at 50¼@50¾c.; steamer mixed, Sept. option, at 49¾c.; do. Oct. option, at 49¼@49¾c.; do. Nov. option, at 50@50¼c. Oats have been active but in large supply and lower; latest sales are of New York No. 1 at 31c.; New York No. 2 at 29c.; New York No. 3 at 26c; white Western at 26½@35c.; mixed do. at 25@32½c.; white State at 28@35½c.; mixed State at 26½@32c; New York No. 1 white at 35c.; New York No. 2 do. at 29@29½c.; New York No. 3 do. at 27c.; New York rejected at 25½c.

HAY AND STRAW.—Prime hay is wanted, and brings very regular prices but common stock is in large supply and difficult to sell, except at easy prices. Sales at 45@85c. for shipping, and 65@80c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports for the week, 1,499 bales.

HONEY—Quiet at 16@18c., for single comb; 14@15c. for double do.; Buckwheat 10@12c.

HOPS.—Mr. Emmet Wells says: "Many bales of hops have changed hands this week. The arrivals continue small as compared with last year, which is pretty good evidence that growers are not satisfied with the present ruling figures, and are holding back their hops under the hope of better prices later on. Values here are now well established and more business on export account will be done as soon as the quality of the arrivals improves. We notice that some of our exchanges advise growers to keep their hops at home and wait for buyers to come round. A good many growers acted upon this advice last year and the year before and lost money by it. We would advise growers to use their own judgment in regard to holding or consigning, and not allow themselves to be influenced by anybody. There is a market here for good export hops at more money than buyers are offering in the country, and the grower who consigns early and takes advantage of a bare market will, in our opinion, do better than those who wait for buyers to come round.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, poor, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@8; Olds, all growth, 2@4.

PROVISIONS have been active at lower prices Mess pork quoted at $8 95@9 12½ for spot lots; $8 85 for September and October; $8 85@8.95 for November. Bacon at 6¾c. for long clear and 6¾ for short clear. Lard, western steam, at $6 85 for spot lots; $6 80 for October; $6.80 for November, and $6 80@6 82½ for December. Stearine at 7½@7¾ for prime. Tallow at 7¼@7¾ for prime. Beef hams at $18. Beef—extra mess, $10 50@11; plain mess, $10@10.50; packet, $11@12 for bbls.; extra India mess, $19@20 for city brands; do., Philadelphia, $18@19.

POULTRY AND GAME.—Supplies of live poultry have been large, but the demand for Jewish New Year has kept trade very active. There are nearly 100,000 Hebrews in New York city, and a national feast makes quite an item for the poultry trade.

Chickens, N. J., 12@12½c. lb; State and Penn., 11½@12c.; Southern and Western, 11@11½c. Fowls—N. J., 12@12½c.; State and Penn., 11½@12c.; Western, 11@11½c.; Southern, 10½@11c. Roosters, 5@6c. Turkeys, 9@12½c.: Ducks, fat, ₱ pair, poor to fair, $1@$1.12 as they run 10@80c. Geese, N. J., $1.25@1.75; W. & S., $1@1.25.

Dressed poultry is in full supply for the season; demand gradually increasing.

Turkeys, dry picked, 14@15c.; other, 11@13c. Pa. chickens, 15@17c.; N. J., 13@15c.; State, 13@14c.; Western, 12@13c. Pa. dry picked fowls, 14@15c.; N. J., 13@14c.; poor to fair other, 10@12c. Ducks, extra, 15@20c.; State, 13@15c.; poor, 8@11c. Geese, 6@10c.

Game is in larger supply, and holders meet the demand with easier rates. Venison has appeared: quoted whole deer, 15c.; short saddles, 20@22c.; long do., 18@20c.

Grouse, trapped, pair, 90c.@$1; Partridges 80c.@$1; Woodcock, 90c.@$1 doz.; pigeons, scarce. Mallards pair, 70@75c.; Teal, 40@50c.; common, 25@35c.

SEEDS.—New timothy is at $1.20@1.22½ for prime and freely offered. Clover at 8¼c. held for new western. Rough flax at $1.47½@1.52½.

TOBACCO.—Shippers have been taking fair quantities, and the home demand continues good with prices firm on most grades. Quotations are for

Georgia, Alabama, Mississippi and Louisiana—Fine unwashed, 27@30c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@16c.

LIVE STOCK MARKETS.

Saturday, Sept. 23, 1878.

BEEVES.—Receipts for the week, 11,739 head; do. last week, 11,805 do. The market opened with supplies detained. After a few sales equal to last Wednesday's rates, the yards at Jersey City were suddenly filled, and prices ruled very weak. At 60th Street the offering was moderate, and sold out early at ready prices. Prime to extra Kentucky steers, to dress, 56 lbs., 10@10¾c.; under grades, 8½@9¼c.; selected Ohio, 9½@10c.; common to good, natives, 8@8¾; a few at 9c; a few good Colorado, 9¼c.; other, 7¾@8½c. Texas and Cherokee, 7@7¾c. Buyers were favored in weight. Receipts largely of low grade stock, the latter part of the market handling many Texas, Coloradas and Cherokees

COWS AND CALVES.—The nominal range is 35@65 for common to good milkers, with calves by their sides.

VEAL CALVES.—Choice milk calves have been scarce, and prices have advanced to 7@7½c.; for grassers, 5c. Fed calves sold readily at 4c, owing to the light supply of choice. Fair to good, milk, 6@6½c.

SHEEP AND LAMBS.—Receipts for the week, 29,815 head; do. last week, 36,864 do. Market slow; low prices for sheep obtained with difficulty, quoted, 4@4¾c.; choice wethers for export will not exceed 5c Lambs, 4¾@5¾c.

SWINE.—Receipts for the week, 25,218 head; do last week, 18,024 do. Cool weather improves the demand, and prices are a trifle better; quoted 4¾c. lb. to $4.40 per 100, the latter for Ohio. N. J. dressed, 5¾@6¾c.

INDEX TO NEW ADVERTISEMENTS.

Barrows Savery Co.—Prindle Food Steamer.

A GREAT OFFER!! We will during these Hard Times dispose of 100 NEW PIANOS and ORGANS of first-class makers at lower prices for cash or instalments than ever before offered. WATERS' PIANOS & ORGANS are the BEST MADE, warranted for 6 years. Illustrated Catalogues Mailed. PIANOS, 7 octave $125, 7 1-3 octave $135. ORGANS, 7 stops $60, 8 stops $65, 12 stops $80 cash, in perfect order, not used a year. Sheet Music at half price; some at 1c. a page. HORACE WATERS & SONS, Man'f'rs and Dealers, 40 East 14th St., N. Y.

Halladay Standard.

The only Wind Mill awarded

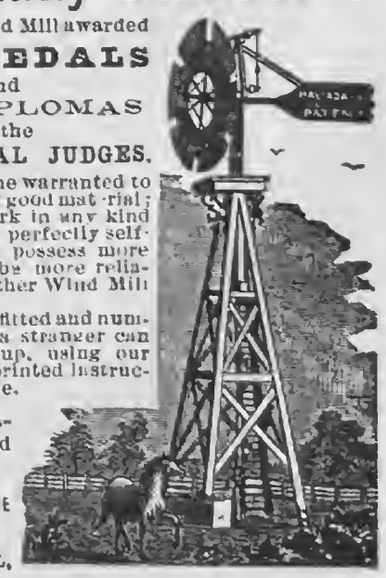
TWO MEDALS

and

TWO DIPLOMAS

by the

CENTENNIAL JUDGES.



Every machine warranted to be well made or good material; to do good work in any kind of wind; to be perfectly self-regulating; to possess more power and to be more reliable than any other Wind Mill made.

Each piece is fitted and numbered so that a stranger can put the Mill up, using our drawings and printed instructions for a guide.

Send for Catalogue "B" and Price List.

U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

Reading for the Young.

MAKE CHILDHOOD SWEET.

WAIT not till the little hands are at rest
Ere you fill them full of flowers;
Wait not for the crowning tuberose
To make sweet the last sad hours;
But while in the busy household band,
Your darlings still need your guiding hand,
Oh, fill their lives with sweetness.

Wait not till the little hearts are still,
For the loving look and phrase;
But while you gently chide a fault
The good deed kindly praise.
The word you would speak beside the bier
Falls sweeter far on the living ear;
Oh, fill young lives with sweetness.

Ah! what are kisses on clay cold lips
To the rosy mouth we press,
When our wee ones fly to their mother's arms,
For love's tenderest caress!
Let never a worldly bauble keep
Your heart from the joy each day should reap,
Circling young lives with sweetness.

Give thanks each morn for the sturdy boys,
Give thanks for the fairy girls;
With a dower of wealth like this at home,
Would you rifle the earth for pearls?
Wait not for death to gem love's crown,
But daily shower life's blessings down,
And fill young hearts with sweetness.

Remember the home where the light has fled,
Where the rose has faded away;
And the love that glows in youthful hearts,
Oh! cherish it while you may!
And make your home a garden of flowers,
Where joy shall bloom through childhood's hours,
And fill young hearts with sweetness.

[*Christian Register.*

SMALL COURTESIES AT HOME.

MARGARET B. HARVEY.

THERE is a great lack of minor refined habits in some places—especially in the arrangement of the table. Setting a table is pre-eminently a lady's work. It should not be left to any frowsy Gretchen, or blundering Biddy, or shiftless Dinah. A woman, with any of the instincts of a lady, however dormant, ought to want to see her table beautiful, and attend to it herself, or give her girl special training in this department.

Country housekeepers, alas! while too solicitous of the substance, often completely ignore the symbol. In most cases their cloths are clean,—usually in some districts, that is all. They are often wrinkled, frequently there are no napkins, the glass is dingy, the knives unpolished, the food arrayed more as regards quantity than appearance, and altogether, to sit at such a board long, would effectually check any attempt to rise above the gross materiality of the subject.

There is scarcely a woman who in her secret heart would not desire better. But the thought of a set of hungry, impatient, dusty, sweaty, farm hands hangs upon her like a millstone. Perhaps she has read Mrs. Diaz's excellent little book, "The School-master's Trunk," and from it has learned,—or perhaps not, and some one has told her,—that rich cakes and pies and hot bread are abominations; in despair, she remembers that she still has this famishing crowd to feed. She may herself believe that plain bread, light cakes, uncooked fruit, and simpler meals, would be wholesome;—but, oh, the "men-folks!" Above all, to imagine *them* brushing their hair and putting on their coats and sitting down to smooth, snowy linen, glittering glass, sparkling silver, shining steel and fresh flowers,—no more!

I might tell you to determine to have plain white dishes, uniform if not priceless; glass like crystal; silver reduced to absolutely solid spoons, forks and butter-knives (more if you can afford it), and the money saved from the shams of plated pitchers and sugar-bowls, going to enrich your damask and then your china,—but I know I should frighten you, were I to add, "Use them every day, arrange them with exquisite care, and embellish them with fragrant flowers."

I know, I am familiar with every difficulty which can beset the mistress of a farm-house. Yet think what cause you have to hope. Your men and boys all go to the pump and splash themselves plentifully with water as though by instinct. If they knew that you sincerely desired it, they would soon form the habit of taking just a minute or two more to arrange their toilets. It is pretty safe to say that if the table invariably presented an exquisite appearance for two weeks, they would be sorry to see a relapse the third. You may not be able to reform the food itself,—but the accessories, with patience, you may.

There is no use in talking. Hard labor, *as* hard labor, in itself is degrading. It is constantly encroaching upon and threatening previous qualities of mind and heart. It is false morality to try and teach otherwise, and it is well for all, especially the greatest toilers, to look this matter squarely in the face. Once warned of the danger, they can study intelligently to avoid it. The end of living is not to labor, but labor is the means of living. High above it and beyond it and jealously guarded from its spoiling influences must be kept *life itself*. Not until we comprehend, as we should in this enlightened age, that since the days of our ancestors the world has wakened to the grand truth that we, ourselves, and our souls, are our true inheritance, to which all external things are to be subordinated, will we understand the real mission of labor,—that is, it is a useful machine, which we must rule and which must not be permitted to rule us. In order to derive permanent benefit from it, we must believe that we owe to ourselves as much rest and recreation, and refinement and culture, as possible. What folly to work so hard for temporal riches that may never come, and neglect daily opportunities to live intelligently in the present!

Would it not be a constant delight, a favorable occasion for the steady conquest of coarseness, this simple matter of the family meal? With carefully arranged appointments, agreeably disposed viands, presentable toilets, combined with seemly leisure, as though a company of Christians (not a herd of famished animals), gathered, and afterwards lingered for the sprightly jest and pleasant chat, what other influences could follow than good ones?

I know a family whose man-of-the-house hearing the dinner-bell as he works among his cabbage plants and tomato vines in the exposed garden, the perspiration pouring down under his broad straw hat and drenching his shirt sleeves, while the broiling sun glows fiercely overhead, places his hoes and rakes under the pear-tree, wipes his streaming face with a snowy handkerchief, and as he leisurely saunters towards the house to give himself an opportunity to cool off somewhat, he frees his hands and nails from temporary lodgments, now and then shaking from his clothes loose particles of dirt. On a bench at the kitchen door is a basin and a blacking-brush, while overhead hang a light coat, a whisk and his cuffs. In a very few minutes the transformation is complete,—hair, boots, nails, necktie, and all are just right. You are soon aware that he changes often enough and is careful enough to keep his shirt-bosom, with his gold studs, immaculate, and the rest is easy. He presents himself in the dining-room,—whether his mother and sister only are with him, or whether there is a large company gathered—the perfect gentleman, whose appearance, except for a little flush of face and hands, perhaps these unmarked, indicates nothing different than it might if he had passed the morning on the piazza with his favorite books. It is the same in the winter,—only then he goes from the chicken-house and corn-crib to his room for a little while. I will add, lest some may whisper, "fancy chap," that he is accounted one of the most successful managers in that place. His vegetables and his poultry are his pride and they might be known anywhere.

Begin, mother, with the little boys, if the big ones are beyond you. Teach them the small proprieties, such as coming to the table neat, eating with their forks, using their napkins properly, etc. The older may make all these things habits, but the younger will grow with them so. I have heard of farmers' boys who have said and felt that they are not treated and considered as gentlemen, because they had to work hard. They were wrong. It was not the work, but because they did not hold themselves above the work. To them I would say, "*Be* gentlemen, and the reputation will follow." There is no reason whatever why you should not. You are, or will be, your own masters. Kings of your own domain. Your position is secure, adorn it. Work, and receive its benefits, but religiously efface its deleterious effects, both in your minds and bodies. Read, study, think, observe, travel, be considerate of women, respect yourselves and your vocation, seek to improve your manners, tastes and habits, and by the time you reach the State or National Legislature, you will find that in the world's great arena you are worth as much as the best of men.

The Puzzler.

CROSS-WORD ENIGMA.

My first is in Robert but not in Abel,
My second is in Homer but not in Mabel;
My third is in Cyrus but not in Mary,
My fourth is in Oscar and also in Sarah;
My fifth is in Alfred but not in Bert,
My sixth is in Cora and also in Gert;
My seventh is in Horace and also in Nora,
My eighth is in Esther but not in Flora;
My ninth is in Tommie but not in Fannie.
My whole is my own name,
If you do not guess it I'll not be to blame.

☞ Answer in two weeks.

HOUR-GLASS PUZZLE.

1. A CHURCH of New York. 2. A State of New England. 3. A city of Louisiana. 4. A town of Maryland. 5. A Southern sound. 6. A county of Kentucky. 7. The goddess of evil. 8. A consonant. 9. A city of Asia. 10. A city of China. 11. A river of Hindoostan. 12. A city of Greenland. 13. A city of Greece. 14. A native of a Middle State. 15. A stream of water in New York. Centrals form a city of Virginia.

☞ Answer in two weeks. LITTLE ONE.

CHARADE.

A MAN came to my first
When at the county fair,
And lounging around and in the dirt
He saw my second there.
"Now water from my whole," he said,
"To quench my second's thirst,"
And this he got without delay,
And brought it to my first.

☞ Answer in two weeks. MERMAID.

PUZZLER ANSWERS.—Sept. 21.

HIDDEN TREES.—1, Catalpa; 2, Poplar; 3, Hemlock; 4, Papaw; 5, Baobob; 6, Buttonwood; 7, Butternut; 8, Arbor-vitæ; 9, Rosewood; 10, Linden; 11, Agave; 12, Alder; 13, Almond; 14, Hazel; 15, Birch; 16, Bamboo; 17, Mistletoe; 18, Banian.

ENIGMA.—
Cares is a noun of plural number,
Foe to sleep and quiet slumber;
Now, any other name you take,
By adding "s" you plural make.
But if to this you add an "s,"
'Tis *cares* no more, but now *caress*;
Plural is plural now no more,
And sweet what bitter was before.

TRANSPOSITION.—
Fair Luna travels into view,
Diffusing many a silver ray,
And twinkling stars are coming too,
In troops across the milky-way.

Sabbath Reading.

THE TRIAL OF JESUS CHRIST.

MEN have too much forgotten that the central event in history assumed the form of a judicial trial. The prodigious influence of the life and personality of Jesus of Nazareth is admitted by all. And his tragical death, early and passionately accepted by Christianity as the significant fact of his career, has become more than any other incident the starting-point of modern history—his tomb, as Lamartine put it, was the grave of the old world and the cradle of the new. But that memorable transaction was the execution of a capital sentence, proceeding upon a two-fold criminal trial—upon one process conducted according to Hebrew and one according to Roman law.

In its judicial aspect, as some others, it is peculiar—perhaps unique. There have been many judicial tragedies recorded in history. Capital trials, like those of Socrates, of King Charles and of Mary of Scotland, have always had a fascination for men. And this trial has impressed and attracted the world more than any or all of these. But I wish to point out that it has in addition a purely legal interest which no one of them possesses.

The questions, for example, are at once raised, Were there two trials or only one? What was the crime for which the accused died? Was the decision in either case right in form, and attained by steps in conformity with the process binding or observed at the time?

These questions of law proceed of course upon an assumed history of fact. This history is abundantly familiar; and, fortunately, there is no special necessity that we should commence this inquiry by an examination of the sources. Men are not agreed how far back they can exactly trace the three earlier Gospels on the one hand, or the later Gospel of John on the other. But the detail, verisimilitude, and authorative calm of these documents impress the reader with a sense of the closest proximity to the life whose course is narrated. And they have no competitors. To some readers it will appear a singular advantage that in the documents on this special subject there is no reference to a miracle. In none of the four records of the trial is there (after the first arrest) any touch of the supernatural in *that* sense of the word. The whole narrative of external fact might have been told of any morning's work of the Sanhedrim, of any forenoon condemnation by the procurator. In truth the incidents of the trial are most natural and probable, and in so far as the four traditions agree there seems no excuse for doubting the history.

All readers know that the Hebrew commonwealth, and the institutions which regulated it, were pervaded by a deep sentiment of justice, righteousness, and law. But all are not aware of the extent to which that sentiment was developed in the later history of the people. In the more ancient part of the traditions of the fathers we read, "When a judge decides not according to truth, he makes the majesty of God to depart from Israel. But if he judges according to truth, were it only for one hour, it is as if he established the whole world, for it is in judgment that the divine presence in Israel has its habitation." It has recently been pointed out that that whole vast later literature of the Jews which we call the Talmud is "emphatically a cyclopædia of all law," which may best be judged by analogy and comparison with other legal codes, more especially with that of Rome and its commentaries. It contains many other things, but this is its basis. And what is more important for us to notice is that this legal basis is the older part.

Accordingly, while portions of the general Talmud commentary did not come into existence for centuries after the introduction of Christianity, the Mishna or central portion is generally admitted to have been compiled by Rabbi Judah, somewhere about A.D. 200. But it was compiled as an oral law which had been growing in use and authority ever since the return of the nation from Babylon—as a "brief extract of about eight hundred years' legal production." Hence, modern Jewish writers refer to it without hesitation as including the code of criminal law which was in existence at the date of the high-priestship of Annas and Caiaphas.

What have been called the four great rules of their criminal jurisprudence—"strictness in the accusation, publicity in the discussion, full freedom granted to the accused, and assurance against all dangers or errors of testimony"—are carried out even in the Mishna in minute and scrupulous rules, leaning almost ostentatiously in every point to the side of the accused, and having force most of all in the case of a trial for life. Indeed, so far does this go, that modern Jews have been disposed to represent capital punishment as abhorrent to the whole genius of Hebrew jurisprudence.

The question whether the Hebrew trial was according to their own rules of law has perhaps not been exhaustively considered by any one writer, though it has been touched upon by many.

On a Thursday night in that month of March, the Thursday towards the end of the passover week, unquestionably took place the *arrest*—the first step before most modern trials. The question has been raised whether the arrest was legal. There is no reason to doubt that it was by authority of the high priest; and the addition of a Roman *speira* to the officers of the temple must have been procured by Jewish authority, and thus tends rather to favor legality. But was arrest before trial at all lawful by Jewish law? It seems not to have been so unless resistance or escape was apprehended. In this case no escape was intended, but resistance, though not intended, was looked for; and the lawfulness of the arrest really turns on the question whether it was to be the preface to a regular trial or not. If so the legal course after it was that followed a little later by the captors of Peter and John, who "put them in ward until the next day, because it was eventide." It was to be otherwise here.

An examination by night followed the arrest. Jesus was first led by his armed escort to the presence of Annas, by far the most influential member of the Sanhedrim.

By Annas Jesus was sent bound to Caiaphas, perhaps only to another department of the sacerdotal palace. But before one or other of these princes of the Church the accused was certainly subjected to a preliminary investigation before any witnesses were called. It is extremely difficult to decide whether this examination by "the high priest," recorded by John alone, was made by Annas or Caiaphas—so difficult that it is fortunate that scarcely any legal question turns upon the point.

But the main point with regard to the high priest's examination is independent of the question who the examiner was. It appears in any case to have been wholly illegal. It was there the right of the accused to be free from all such personal investigation until he was brought for trial before his congregated brethren. This rule of publicity seems to have been derived from principles both as to judges and witnesses. "Be not a sole judge," was one of the most famous aphorisms, "for there is no sole judge but One." Still more clear was it, not from the Mishna only, but from the Pentateuch, that there was to be no such thing as a sole witness; and that the "two or three witnesses" at whose mouth every matter must be established must appear publicly to give their testimony. Their deposition was the beginning of every proceeding; and until it was publicly given against a man, he was held to be in the judgment of law not merely innocent, but scarcely accused. It is this principle which gives the fullest explanation of the answers of Jesus of Nazareth to the midnight questions of the high priest. The ecclesiastical magistrate, probably sitting privately, and certainly before witnesses were called, asked Jesus of his disciples and of his doctrine.

"Jesus answered him, "I spake openly to the world; I ever taught in the synagogue, and in the temple, whither the Jews always resort; and in secret have I said nothing. Why askest thou me? ask them which heard me, what I have said unto them: behold, they know what I said."

It was in every word the voice of pure Hebrew justice, founded upon the broad principle of their judicial procedure, and recalling an unjust judge to the first duty of his great office. But, as one who studied that nation in older times observed, "When a vile man is exalted, the wicked walk on every side" around him; and when the accused had thus claimed his rights, one of the officers of court—a class usually especially alive to the observance of form and of that alone—struck Jesus with the palm of his hand, saying, "Answerest thou the high priest so?" The reply of Jesus is exceedingly striking. In it he again resolutely took his stand on the platform of the legal rights of a Hebrew—a ground from which he afterwards no doubt rose to a higher, but which he certainly never abandoned: "If I have spoken evil, bear witness of the evil: but if well, why smitest thou me?"

The words are no doubt a protest for freedom of speech and liberty to the accused. But they appeal again to the same principle of the Hebrew law—that by which *witnesses* took upon themselves the whole burden of responsibility, and especially the whole initiative of every accusation, even as they were obliged to appear at the close, and with their own hands to hurl the stones. And the renewed protest was so far effectual. For now the witnesses came forward, or, at least, they were summoned to bear their testimony; and only when they came forward can a formal trial be said to have commenced.

But did all this not take place by night? And was a trial by night legal?

On the question of fact, it is well known that the four Evangelists give a confused account of what took place. Matthew and Mark, omitting the seemingly private interrogation of which we have already spoken, distinctly narrate a double and very striking trial by night—first by witnesses, and then by an attempt to obtain a confession; but all before the high priest, the scribes, and the elders, to whom Mark adds, "all the chief priests." Their narrative reads as if the first part of this trial might have taken place almost as soon as the prisoner was brought from the Mount of Olives. At all events, in their narrative it took place by night, while in the morning there was a second and separate "consultation" of a similar, but seemingly larger and more authoritative meeting. John, on the other hand, narrates the interrogation by the high priest, the transfer from Annas to Caiaphas, and the delivery to Pilate in the morning, but does not allude to any trial before the council. These two representations, though not contradictory, are unsatisfactory and inconsistent; and the tradition of Luke which differs from both, completes the confusion, but helps us to a result. He omits the earlier part of the alleged trial—the interrogation of witnesses; but narrates the confession and condemnation as at one meeting of the council, which took place "as soon as it was day," and after which the whole multitude "led him to Pilate." Putting all these representations together, there was no difficulty in arriving at the order of the historical transactions, though there will always be insuperable difficulty to those who insist on their legal validity and regularity. The visit to Annas and the transfer to Caiaphas came first, with the interrogation of the accused by one or other of the high priests. About this earlier hour certainly took place the denial of Peter related by all the Evangelists, while some time must have been consumed in sending for witnesses and summoning either the whole council or its members.—[To be continued.

PERSONAL ITEMS.

James Gorden Bennett is forty-two.

Senator Bayard of Delaware has originated a new peach.

Potter, the wheelbarrow lunatic, has reached San Francisco.

The widow of Daniel Webster, now in feeble health, is at New Rochelle.

Marshal P. Wilder, the veteran Boston pomologist, has reached his eightieth year.

The Countess of Ariosto, the last descendant of the poet, has just died at Ravenna, aged ninety.

Marshal and Mme. McMahon lately sent to Minister Noyes 6,000 francs for the yellow fever sufferers.

Thomas Carlyle has begun his autobiography, which he intends to be his last work, and which is to be published after his death.

Garibaldi is in excellent health and spends most of his leisure hours in stimulating the "Unredeemed Italy" movement. He is soon to receive a visit from Victor Hugo.

Mrs. Dennis Kearney, wife of the California agitator, while en route East the other day, was the victim of an assault by a party of roughs, who broke into the second-class coach where she was sleeping.

Maria Grace Washburn, of New Haven, though younger than many who will read this—being in fact only nine years of age—has read the Bible through eight times and not skipped any of the tough names.

The Hon. Caleb Cushing, lately nominated candidate for State Attorney-general of Mass. on the Butler ticket, has been suffering from erysipelas in the head for two months past. It has compelled him to suspend all literary work.

People blessed with fine voices generally take great delight in sweet sounds. This trait accounts for the fact that the great Prima Donna, Patti, is said by a Cardiff paper to have purchased Craig-y-nos Castle, near Istradynglais.

There are four candidates for the Bulgarian throne—the Prince von Battenberg of the family of Hesse, who is the Russian candidate; General Ignatieff, the Panslavic candidate; Prince Emmanuel Vogorides and Prince Karageorgevitch.

"The Claimant," Orton, alias Sir Roger Tichborne, is now employed at Portsmouth Dockyard, sawing timber. He is much thinner than he was. At first they set him to brick making, but he attracted too much attention from the curious visitors.

Some memoirs, about to be published in Paris, state that Thiers was so small a baby that he could have been put into a wooden shoe. He was baptized in a cellar, since the reign of terror had but just come to a close, and the priests were all afraid to perform the ceremony in a church.

The Pope is, they say, a most indefatigable letter writer. He has taken it in hand to reform the regular clergy, beginning at Rome, and has had furnished to him a list of all the priests resident, with particulars as to their private lives and the manner in which they discharge their duties.

The Duke of Devonshire, by two successive flukes, though born a simple squire, became first an Earl, and then what he now is. His Grace is the possessor of an enormous fortune, has six country seats distributed in the three kingdoms, and the historical mansion known as Devonshire House.

Butler is worth three millions; Butler is worth two millions; Old Ben Butler is worth fully a million and a half; Cross-eyed Ben, the representative of labor, is worth at least a million of dollars. Infallible newspaper scribes make these statements. You pay no money, but you take your choice.

Mr. Tennyson has obtained an injunction against the Christian Signal, an English weekly, restraining it from interfering with his productions. Notice had been given in the paper that it would shortly print an unpublished poem of 200 lines by Mr. Tennyson, entitled "Confessions of a Scientific Mind."

The death of millionaire Reese, according to the San Francisco Argonaut, came about in the meanest kind of a manner. He was trying to steal out of a Paris cemetery without paying the fee, and when caught by the irate sexton the blood rushed to his head, causing death. He lived to save $10,000,000, and died to save a silver groschen.

Congressman-elect Murch, the greenback-labor representative of Maine, is a tall, good-looking and well-proportioned man of forty, a blonde, with blue eyes and light-brown mustache and hair sprinkled with gray. He has been a sailor, lumberman, dairy-farmer, rigger, stone-mason and granite-cutter, has never saved a dollar and is proud of his improvidence.

Queen Victoria travels in a railway carriage which cost $30,000. A correspondent of the Chicago Times says that its windows are shaded with green silk curtains, trimmed with costly white lace. Its ottomans are covered with cream-colored silk, embroidered with the royal arms and monogram in purple and gold, and a carpet which cost over $500 covers the floor.

Sir Garnet Wolsely, the ruler of Cyprus, has a good hand at description. He was in this country during the Civil War, and thus wrote of Stonewall Jackson: "A broad, open forehead, from which the hair is well brushed back; his shapely nose, straight and long; thin, colorless cheeks, with only a very small allowance of whisker; cleanly shaved upper lip and chin; a pair of fine grayish blue eyes, rather sunken, with overhanging brows, which intensify the keenness of his gaze, but without imparting any fierceness to it, * * * and a smile that seems always lurking about his mouth when he speaks."

Ex-Queen Isabella of Spain, though she has not kept all the commandments, is represented as very kind-hearted. In Paris, where she generally lives, her name is associated with many acts of generosity. She does good whenever opportunity offers, and always, if possible, in a purely private way. When money is needed, she is one of the first called upon, and she never refuses to give—and give liberally. Her gross figure hides, but does not interfere with, a very sympathetic and tender heart. The late sale of her jewels brought some $400,000 more than it was thought they would bring, and she intends to devote the whole of this sum to a tomb for the young Queen Mercedes, her daughter-in-law, of whom she was very fond.

Of Prince Bismarck at home, a correspondent of the London Times writes:—"Nothing is more simple and touching than the respectful and silent enthusiasm with which his wife and children surround him, and the devotedness they show to him. In his family circle he lets himself be governed by their anxious tenderness. When he leaves the table his wife or son brings him his long clay pipe and lights it for him. This first pipe smoked, a second, all ready, is handed to him, and this is afterward gently taken from him without a third being brought. The prince yields to this silent tyranny, which relieves him of a portion of his personal cares. His son Herbert told me, 'I have put my father to bed, for he, too, you see, ends by being tired.' He is treated, indeed, by his family as a demi-god, and cared for as an infant. On hearing him chat with his family one is struck by the clearness with which he stoops to familiarity, and also by the feeling of irresistible force which he inspires, so that when once he has said anything it becomes law."

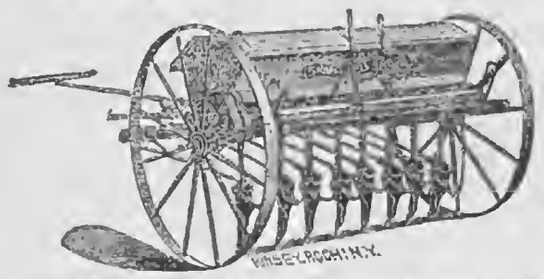
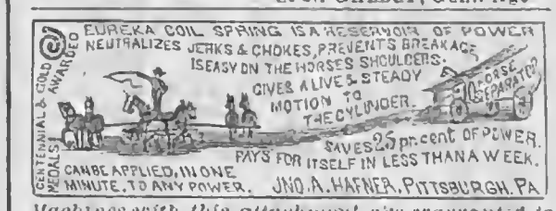
EDWIN ALLEN.

Implements and Machinery.

FACTS FOR FARMERS.


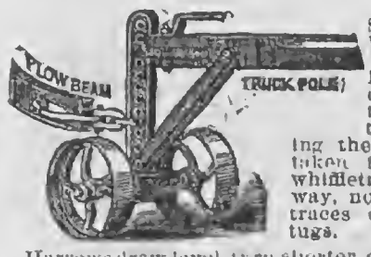
1st.—The Centennial Commission MADE BUT FIVE AWARDS to Grain Drills and Fertilizer Attachments.
2d.—Of these five, TWO were given Bickford & Huffman. One on the FARMER'S FAVORITE and one on Fertilizer Attachment.
3d.—NO OTHER MANUFACTURERS RECEIVED AN AWARD ON A FERTILIZER ATTACHMENT!
4th.—The award to the "Champion," built by Johnson, Gere and Truman, was "for a machine with attachable manure distributer;" an implement they did *not* exhibit and *do not offer for sale*, as their "manure distributer" is neither "attachable" nor detachable. The report does *not* commend this drill or its "manure distributer," for a single quality of work.
5th.—The award to the Farmer's Friend pronounces it defective by saying *it is capable of further improvement, as regards delivery up and down hill*; and also to the McSherry drill in these words: "*Some further adjustment appears desirable to enable this drill to deliver with equal equality up and down hill.*"
6th.—The Empire, Buckeye Hoosier, Superior and Hagerstown drills were *refused* EITHER AWARD OR REPORT, because of great "irregularities" or "variations" in the tests.
7th.—The variation of our nearest competitor, The Champion, *from its own distribution*, was MORE THAN 237 PER CENT. of that shown by the FARMER'S FAVORITE.
8th.—The award to the FARMER'S FAVORITE, distinguished it by commending it for "ACCURACY OF DELIVERY, AND REGULARITY OF DISCHARGE UNDER DIFFERENT CONDITIONS," and "REGULARITY OF DELIVERY UNDER ALL CONDITIONS." Qualities conspicuously lacking in its competitors.
We challenge contradiction of a single feature of the above statements.
Fully 80 per cent. of all the Fertilizer drills in use on the American Continent are built under our patents,—a fact that tersely and undisputably establishes superiority. For circulars, prices of information see our agents, or address **Buckford & Huffman, Macedon, N. Y.**
S. N. GALLUP, Genl. Agt



Machines with this attachment are warranted to thrash at least one-third faster with the same power.
Price only $15.

PENNSYLVANIA AGRICULTURAL WORKS,
YORK, Pa., August 26, 1878.
MR. JNO. A. HAFNER—*Dear Sir:* Your favor received. I have sold several of your Springs with engines to drive separator by tumbling rods, and they answer first-class purpose. My *Six-horse Engine will run a Ten-horse Separator* by gear without difficulty. I will send your Spring with all geared machines and engines free of charge, next year, which I think will thoroughly introduce them in the country. Truly yours, A. B. FARQUHAR.

IMMENSE SUCCESS.
The HARRIS Farm Truck!



Saves the Gage Wheel, half the labor of holding, 12 to 15 per cent. of the draft, team can back the plow, no riding the beam, plow taken to the field, whiffletrees out of the way, no stepping over traces or letting out tugs.
Harrows draw level, turn shorter, do ¼ more work. Holds Shovel Plow, prevents jumping and dodging. On Scraper saves man and team. Handles never get muddy. Will pay its cost in one week.
Just the thing on Stone Boat, Horse Fork, etc., etc.
Hon. Harris Lewis, Pres. N. Y. D. A., says: "The best farm implement for the money, he ever owned."
Prof. Arnold, Sec. A. D. A., says: "It will be considered an indispensable addition to the list of farm implements when once tried."
Hon. T. F. Randolph, U. S. Sen. from N. J., says: "It is desirable because of its simplicity, effectiveness and economy."
Great Inducements to one responsible Canvasser or Agricultural Dealer in each town.
Where no agency is established a Truck will be sent freight prepaid, upon receipt of price. Send for testimonials. Price, Farm Truck, $6; Thills, extra, $2.
SAXTON & AMIDON, Manufacturers,
MILO HARRIS, Gen. Agt. Buffalo, N. Y.

Implements and Machinery.

Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one.
Address, P. K. DEDERICK & CO., Albany, N. Y.

New Publications.

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose, WE ISSUE SEMI-ANNUAL EDITIONS OF
AYER & SON'S MANUAL
FOR ADVERTISERS. 184 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of 25 cents by N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

Wit and Humor.

"Don't give it a whey" is a parallel expression to "cheese it."—*Reynolds Herald.*

You never see a dark-complexioned dumb man, because a dumb man can't tan, sir.

When Mr. Thomas hears the squeak of a young porker, he remarks, kindly, "A good voice, but needs cultivation; we'll fix all that."—*N. Y. Commercial Advertiser.*

"Oh, why should the spirit of mortal be proud?" is often asked. Well, really, we don't know, unless it is because he can climb a tree and a mule can't.—*Philadelphia Chronicle-Herald.*

This country is terribly demoralized, and soon the greatest crimes will excite no wonder. We should not be surprised to hear of a young man we know of sleighing his girl before the year is out.—*Fond du Lac Reporter.*

Oh the corn, the horrible corn,
Burning at night and aching at morn;
Under somebody's foot half of the time,
Throbbing with misery almost sublime,
Paining,
Inflaming,
Big as your fist—
Show me the sign of the chi-rop-o-dist!

Some one has at last discovered the tendency of the average milkman to water his milk. His instinctive desire that his milk shall be pure, impels him to wash it carefully before delivering it to his customers, and some of the water is apt to get left in.

"Beaconsfield wears his garter on the left breast," an English paper says. His stockings haven't been sent from the wash, we suppose; or is the old boy's left leg like a Dutch churn, bigger at the bottom than the top.—*Cincinnati Breakfast Table.*

Said an aristocratic little Miss "Ma, if I were to die and go to heaven, should I wear my moire-antique dress?" "No, dear, in the next world we shall not wear the attire of this." "Then, ma, how will the Lord know I belonged to the best society?"

A member of a church being particular about the new minister, is said to have prayed alond at the late meeting of the kirk elders, "Send us not an old man in his dotage, nor a young man in his goslinghood, but a man with all the modern improvements."

In England, correspondents are dismissed by editors but with scanty courtesy. A shrinking maiden forwards some verses upon a "Bunch of Violets." The composition is thus acknowledged: "Your poem has seen the light. We lit our cigar with it."—*Exchange.*

"Of all the poets, darling one,
Who've rhapsodized of love,
Which one evokes your ardent praise
All other bards above?"
And as he took her in his arms
And kissed her o'er and o'er,
She spake, in tones of ecstasy,
"O, Tommy, give me Moore!"

[*Yonkers Gazette.*

Dog-seller: "That 'ere hanimal's the real stock, mum, and dog cheap at five pounds." Young widow: "It's a sweet, pretty darling, black and white; but in my present state of bereavement you procure me one entirely black. This will do very well for half-mourning in about six months."

The Rev. Henry Ward Beecher, a while ago went to a hotel in a city of New Jersey for a night's stay. He ordered supper, and after taking a few sips of coffee, called the colored waiter and said: "Can you give me your service this evening?" "Yes, sah," said the waiter briskly. "The matter is one of importance," said Mr Beecher, solemnly. "Perhaps I had better speak to the landlord myself about it." "Oh, no, sah," said the sable attendant, fearful of losing the thumping fee that the preacher's earnestness foreshadowed. "I can give you all the time you need." "Well then," said Mr. Beecher, with added solemnity, "I want you to sit up to-night with this coffee. It is so weak it is going to die before morning." There was a moment of pathetic silence, and the waiter withdrew.

The Irrepressible.—They were all out at the springs—father, mother, and the five-year old boy. After an invigorating bath they went up on to the hill to the "chicken-soup" spring, and while regaling themselves with the delightful drink, the little one looked at the bubbling, steaming water a moment, and then asked:

"Mamma, what makes that water boil so?"

"God does, my son."

"How does he do it?"

"Oh! he builds a big fire under it."

"Does he build the fire his own self?"

"Yes, I suppose so."

The little one reflected a moment, then asked:

"Mamma, does God kick over the chairs and swear at Mrs. God when he has to get up and build the fire?"

The wife glanced suggestively at her husband, but his eyes were fixed intently upon some object away down the river. The silence for a minute was absolutely painful, and then the man softly remarked,

"I never before knew the Humboldt to be so low at this time o' year."—*Elko Post.*

IN FASHION JOURNALS.

IN REALITY.

Nothing but a steady dye-it will preserve the reputation of a moustache on the face of a red-haired man.—*Danielsonville Sentinel.*

A writer mentions the fact that "it is a general custom not to use napkins at luncheon in England." If John Bull thinks he is ahead of Uncle Sam in such matters of etiquette, he is sadly mistaken. Tramps, in this country use neither napkins nor forks at either breakfast, dinner or luncheon. But we don't deem it worth bragging about.—*Norristown Herald.*

A clever youth, according to the Hartford Times, is a little five-year-old boy, residing with his parents in the Cheney block. He was asked by a lady, a few days since, for a kiss, and immediately complied; but the lady, noticing that the little fellow drew his hand across his lips, remarked: "Ah, but you are rubbing it off." "No, I ain't," was the quick rejoinder; "I'm rubbing it in!"

"Let me look at your dictionary a minute," a polite, well-dressed stranger asked, bowing into the sanctum in some haste yesterday morning. "Certainly," and we shoved Noah W.'s charming novelette, unexpunged edition, over to his side of the table. Long and earnestly looked the man. Then a dark frown settled down on his brow like a winter cloud. He banged the book down on the floor and kicked it. "Blame such a dictionary!" he roared, "I would n't give a cent a thousand for such a book! It 's got Independence and Homestead and Crescent and Pilot and Sandwich and a whole host of them little towns in it, and never a mention of Burlington or Keokuk or Des Moines or Chicago or any big town in the whole book!" And he gave it a parting kick and was gone.—*Burlington Hawkeye.*

A Word of Warning to Counterfeiters.

The wide-spread fame of Hostetter's Stomach Bitters causes a necessity on our part to remind, from time to time, whom it may concern, of the fact that imitating said article is a punishable offence, and we now give this word of caution, that we will most assuredly have all those persons engaged in re-filling our second-hand bottles, selling by the gallon or barrel, or in any manner whatsoever palming off on the public a spurious article purporting to be our preparation, punished to the full extent of the law. Penalty for counterfeiting, or dealing in counterfeit trade-mark goods, as set forth in a law recently passed by Congress:—"Fine not exceeding $1,000, or imprisonment not more than two years, or both such fine and imprisonment." We never fail to convict.

Notice to Dealers and Purchasers.—Hostetter's Bitters *are never, under any circumstances, sold in bulk*, but always in bottles, with a finely engraved U. S. Internal Revenue (special proprietary) Stamp covering the cork of each bottle, fastened to both sides of the neck of same. All Bitters purporting to be Hostetter's, without this stamp, are counterfeit. Hostetter & Smith.

$57.60 AGENT'S profits per week. Will prove it or forfeit $500. New articles, just patented. Samples sent free to all. Address W. H. Chidester, 218 Fulton St., N. Y.

CIDER PRESERVATIVE. The use of this ANTI-FERMENT keeps Cider sweet, or sparkling and bright. It *immediately arrests all fermentation*, and keeps it just where it is wanted. *Perfectly harmless and tasteless*, and the unpleasant odor of Sulphite of Lime is avoided. One package (sufficient for 40 gallons) sent by mail for 35 cts. Six packages for $1.75. Send for Circular. H. & J. Brewer, Springfield, Mass.

USE THE PERFECT BUTTER COLOR! Wells, Richardson & Co.'s Perfected Butter Color is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. Wells, Richardson & Co., Prop's, Burlington, Vt.

EMPIRE FARM FORGES & TOOLS, THE BEST. THE CHEAPEST. Thousands in use. Send 3 cents for Circular to EMPIRE FORGE CO., COHOES, N. Y.

The Herdsman.

LADY CAREW 3d.

THE London Agricultural Gazette is doing good service to the cause of animal portraiture, to say nothing of the pleasure it gives its readers, and sometimes *ours*, in that it is accustoming them to see and value good portraits made by first photographing the animal and then having the picture sketched with an accurate hand, yet with artistic freedom.

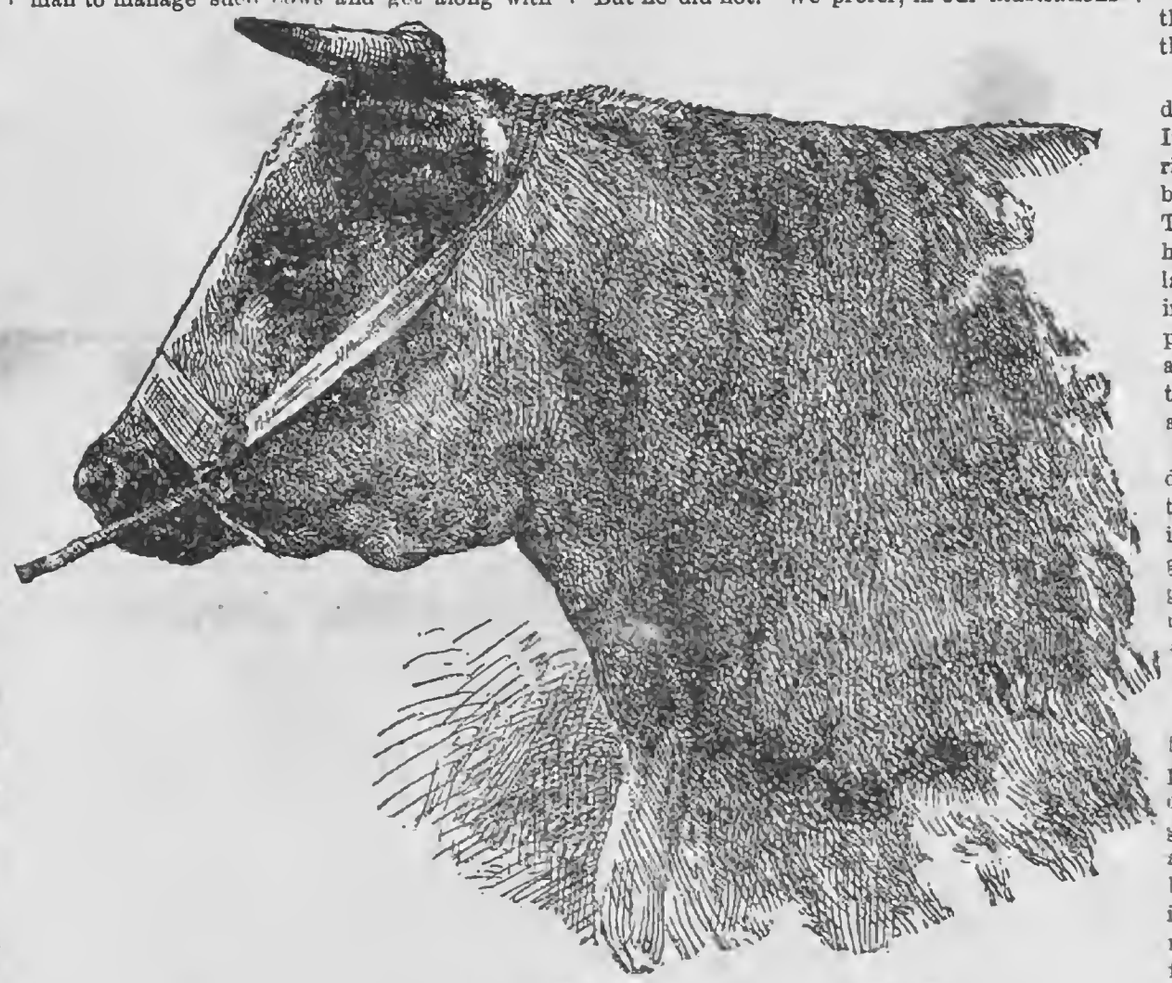
The Ladies Carew 1st, 2d and 3d are sisters and all prize-winners at the English shows. They are described as having been as heifers "somewhat small, with very fine bone and on very short legs" with the silkiest of hair, long and even in carcass, "somewhat unduly weighted with flesh, and fat at both ends." The one pictured has a bosom "wonderful to see," and inherits the blood of several leading fashionable strains, not the least notable of which is that received from her sire, which is "the purest Warlaby." Now these wonderfully perfect Shorthorns are discussed editorially as if they exhibited the results of deep-laid plans made when their great-great-grand-dam was bred; for the editor says: "Say not that an experiment in breeding has failed until you see the second and third generations." Now we take it the breeding of these heifers was somewhat in this wise:

Farewell was a rather famous cow of the Warlaby herd, and after she had, to all appearance, nearly passed her usefulness (being, however, in calf to Rubens, a justly famous bull) she was brought to the hammer. Her daughter, *Fanny*, was also sold in her old age "for a song," and a daughter of hers, *Heather Bell*, by a Bates bull, when a very old cow and supposed to be past breeding, dropped a calf, by a Booth bull, so little expected that it was called "*Miracle*." One of her numerous daughters, a blood-red cow called *Lady Jane*, by a Bracelet bull, "was one of the cheapest lots at the famous Beeston sale in 1872." She, in the hands of Mr. St. John Ackers, has produced these three heifers by *County Member*, a bull of the Christon tribe, of the Warlaby Herd.

Here we have breeding entirely without system, so far as we can see, except the system of all breeders of fair observation, namely, that of matching animals by external form, style and character. The ancestors of these heifers, in the dam's line for generations, were all cheap cows, hardly worth the consideration of breeders except for the good they had done perhaps—"knocked down for a song," one after the other, simply because they were of no particular strain, though the blood was good. They presented with rather growing intensity, one after the other, the results of such breeding. Now, in these beautiful creatures, rolling in fat, smooth, fine, delicate in form and bone, *touchingly* good handlers and walking off with medals and ribbons, we have the legitimate result of putting a bull of strong blood upon a cow from whose breeding we should expect no *strength* (prepotency) but only excellence. Of course, his good qualities tell as surely upon such a pedigree as if he were bred to a good grade cow, and this indicates clearly the way to breed prize-winners, and a possible fault in the way we award prizes without reference to breeding, except so far as to assure purity of blood.

NERVOUS COWS.

No observing person can have the care of a herd of cows long, without noting a great variance in the character and disposition of the different animals. The famous Mrs. Partington once remarked, that "there is as much difference in folks as there is in anybody,"—and it is just so with cows. The feminine peculiarities that we are apt to note in our own kind may, many of them, be detected among the domestic animals. Some cows are so phlegmatic and good-natured that a moderate amount of ill-treatment does not seem to disturb their equanimity. Others are naturally vicious, and will kick and hook without provocation. There is another class that, while not vicious, are so nervous that they may easily be made to appear ugly, and in time really become so, in consequence of rough handling or carelessness. It requires a considerate and good dispositioned man to manage such cows and get along with them. They must be humored, spoken kindly to, and gently handled in milking. Swearing at them, or beating them, demoralizes them fearfully, and makes them almost useless in a short time. It is often among the very best milkers and butter-makers that these nervous animals occur, and we cannot afford to have their value thus impaired. No violence should be allowed among the cows at any time; but if you have impatient help, or are quick-tempered yourself, let some person who doesn't get mad so easily, milk the nervous cows. A cruel man ought never to have charge of any stock whatever.



MR. ST. JOHN ACKER'S LADY CAREW 3d.

OUR RASPBERRY FESTIVAL.

MONTCLAIR RASPBERRY.

OUR engraving of the Montclair Raspberry is an accurate portrait of a branch brought to this office by Mr. Williams, not with any view to having it engraved. Many of the berries had been shaken off which our artist *might* have replaced. But he did not. We prefer, in our illustrations whenever we feel at liberty to do so, to present our readers with illustrations which the plants, if purchased and cultivated, will more than verify.

THE MONTCLAIR AND OTHER RASPBERRIES.

J. C. WILLIAMS.

THE Montclair Raspberry is doubtless an accidental seedling. We found it growing and fruiting well in a neglected corner of our vineyard. A casual taste of the fruit awakened us to the fact that it was far better than the Philadelphia and indnced us to take up the dozen or 20 plants which were struggling for existence in the grass and weeds, and to put them out under more favorable conditions. This was in '72. The fruit has continned to grow in favor yearly since then, but has never attained the size it did in '73. That year the berries were enormous, exceeding in size any we ever saw before or since, and we have always regretted we did not take some measurements. Had we done so they might have been questioned, so I will leave this point for the future.

We suppose it to be a seedling of the Philadelphia, which it resembles in wood and foliage. It is fully as hardy and productive as that variety, while the fruit is larger, firmer and much better in quality, with no tendency to crumble. The color is rather dark when fully ripe. It has always stood exposed without injury till last winter or spring; then, but few canes were injured more than was necessary to remove at pruning time. It usually commences to ripen about the 4th of July and is in season about three weeks. It is a strong, vigorous grower and multiplies rather sparingly from the roots.

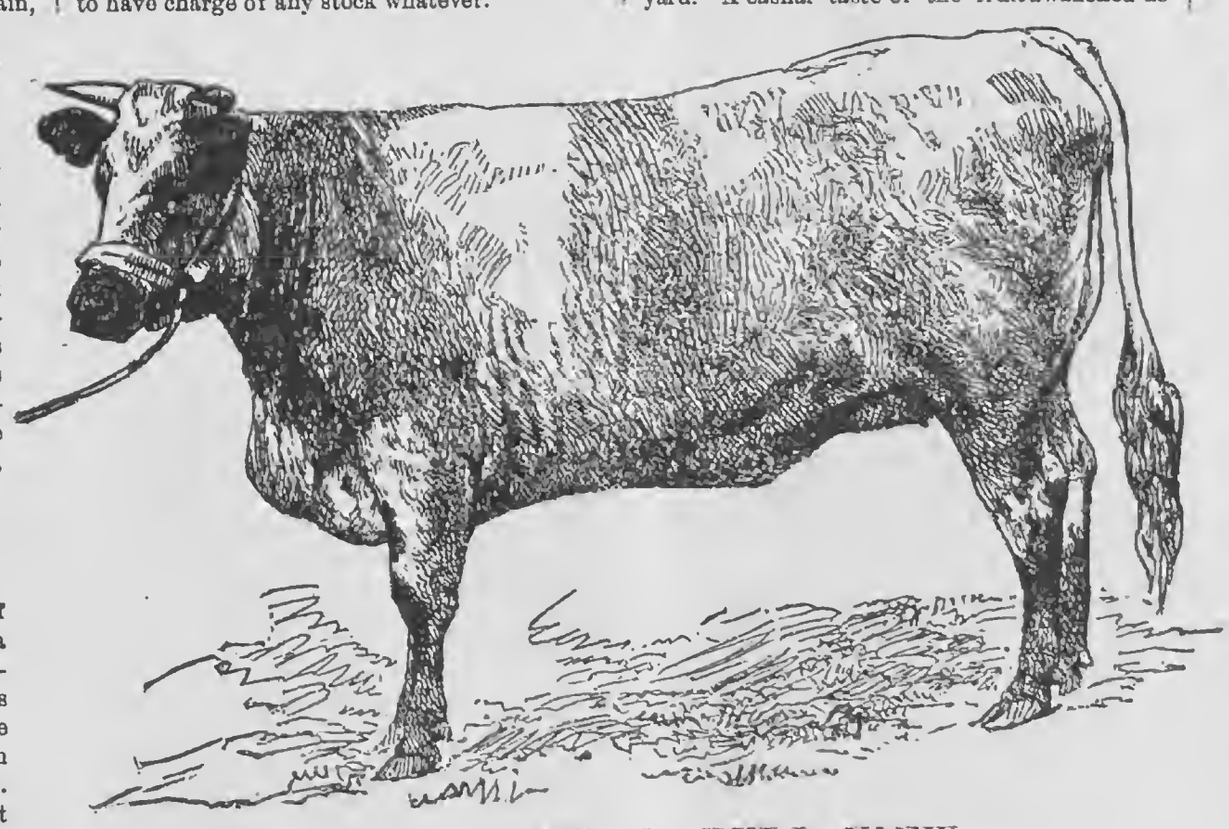
With regard to its quality, people will and do differ, I do not hesitate to say I have eaten better berries. We have never claimed superiority in this respect for it, but if its habits can be regarded as fixed, we do claim, in brief, that in point of hardiness, productiveness, size, firmness and quality combined, it is for us, on our soil,—a stiff red clay loam—head and shoulders above any other variety we have ever cultivated.

THE HIGHLAND HARDY, growing in the same field under like conditions we commenced to pick this season on June 26th, before the close of the strawberry season. The fruit is of a good quality, very abundant, but rather small, and valuable for its earliness. This is said to be the old Kirtland under a new name, but, if it is so, is it not strange our fruit-growers and nurserymen have not discovered this fact before? We grew the Kirtland nearly 20 years ago, but my recollection will not allow me to judge intelligently on the question of identity. The nurseryman and fruit-growers of Western New York, who still retain the Kirtland, could easily determine this matter.

THE BRANDYWINE, in the same field with the above, proves more productive of suckers than of fruit, and, to my taste, it is below medium. I can fully indorse the remark with regard to it, made by Mr. Collins at the last meeting of the N. J. Hort. Soc'y "It is of poor quality, firm and bears transportation well; but it is the color of the fruit that sells it." The suckering propensity of the Highland Hardy is objectionable but in this the Brandywine will exceed it three to one, while its fruitfulness as compared with our seedling, it is about as one to five.

We have grown Arnold's Red and Yellow, Allen's, Belle De Fontenay, Elm City, Philadelphia, Clarke, Hudson River Antwerp, Franconia, Naomi, Brinckle's Orange and others, and though the last five named are fine in size and quality, they lack hardiness, an indispensable quality with us. We have a number of more recent introductions, on trial. If among them we shall find the Raspberry, *par excellence*, we are all looking for, we shall cheerfully and unhesitatingly say so; but at this date Montclair is ahead. We await the returns from other districts, with no small degree of interest. Another season they will be forthcoming, meanwhile the future destiny of the "Montclair" rests on the verdict of a discriminating public.

As an illustration of the difference of people's views on the raspberry question, as well as on others, I record the following: Two or three years ago, a friend said he had a hardy Orange Raspberry, a seedling of Brinckle's Orange, fully as good and large. In fact, one could not tell the difference in the fruit, and it was perfectly hardy, and as we were in the business he would let us have a few plants for trial and dissemination. We accepted



LADY CAREW 3d.—FULL VIEW.
After a Drawing from Life.

the offer, not, however, with implicit confidence that a "big bonanza" was in store for us, but a hardy Brinckle's Orange was a desirable thing. We have grown and fruited the "foundling" for two seasons. The plant in foliage resembles its parent, but it is more vigorous and nearly hardy; but, alas! the fruit no more resembles it than does the old White Antwerp. In fact, it is a dull white berry, with no orange color about it. Now, we have no reason to doubt that our friend thought his representation correct. He is probably afflicted with what is known as color blindness, and his taste may also be at fault, for naturally there is a wide difference in tastes, and when tastes are educated this difference is none the less apparent.

A gentlemen visiting us during the last raspberry season, after tasting the different kinds, asked me if I could tell any difference in the red ones save in color? On replying that I would name each of the three or four kinds just shown him by tasting without seeing them, he was surprised. He could see and taste a difference between the red and black ones, but all the red ones were alike in taste to him. And thus it is with some people; yes, with a great many. A raspberry is only a raspberry and a strawberry a strawberry, no matter how high or low its position in point of quality.

In conclusion, I would remind the reader that the above convictions are founded on our experience on our own soil. This is an important consideration for many people. New Jersey is regarded as nothing but a sandy loam or drift, which is far from the truth. Under different conditions these views would be subject to modification and change.

Montclair, N. J. July 20 1878.

HERSTINE—(See Illustration, next page.)

This now well-known variety, as will be seen, has become popular in many parts of the country. It is generally considered hardy in this climate, though from our reports it seems not to be so in even warmer sections. The Herstine is one of several seedlings, which, when first introduced, were considered promising, but which time and trial have driven into disgrace. The illustration is from life, though it is but fair to add that so fruitful a branch and one bearing berries of so large a size is of rare occurrence.

THE CUTHBERT AND BELLE DE FONTENAY.

J. T. LOVETT.

THE CUTHBERT RASPBERRY.

The writer, in the RURAL of August 18th, 1877, states this Raspberry to be the best new variety, all things considered, that he fruited in 1877. I now esteem it, after a thorough trial, the best Raspberry, new or old, that I have ever seen. Turner is hardy and productive enough and of good quality, but it is too small and not sufficiently firm to bear shipment. Brandywine is of a bright and attractive color, and firm enough to be transported almost any desired distance. It is comparatively hardy—although not entirely so—but it is not productive enough, while it is of too feeble a growth of cane. Philadelphia is abundantly productive, but decidedly too soft, lacking in brightness of color and too tender to be relied upon. Antwerps will succeed in certain localities only, and are unreliable even there—and so it goes. Cuthbert is absolutely hardy—the only red Raspberry I am acquainted with that is so, except Turner—is a strong, vigorous grower, has never been known to be affected by disease or mildew, or to lose its foliage during summer. The plant is very productive, the berries exceedingly large, of bright attractive color, very firm, and of superb quality. What more can be desired? In this I believe we have the ideal Raspberry which has long been wished for, one that combines nearly or quite all the qualities desired in a Raspberry, and one equally valuable to the amateur and to the professional fruit-grower.

Yet the Cuthbert is not without a fault—it suckers too freely. While this may be an advantage to the nurseryman, it is not to the fruit-grower, as all surplus suckers have to be treated as so many weeds. This is not a serious objection, however, and the Cuthbert in this respect is not so bad as Brandywine, and not nearly so bad as Turner. All things considered, it is not only the best, but by far the best Raspberry I have yet seen, and is unmistakably destined to become the Raspberry for the million.

Under favorable circumstances, what a fine Raspberry is

BELLE DE FONTENAY;

that is, where soil is congenial and suckers are kept down. It has long been known to fruit-rowers as a precarious variety, but wherever planted, unless diligently attended to, it soon becomes a troublesome weed, from its tenacity to life and its habit of overproducing suckers in infinite numbers Where soil and situation are just right, with its very large, aromatic berries, it is not surprising that those who have never seen it and find it growing under such circumstances, at once conclude they are the happy discoverers of a new seedling of wondrous merit. A few years ago we heard of this berry, from the shores of Maryland, under the cognomen of Amazon—a most appropriate name—at fifty cents a plant; now we have it from Connecticut as Henrietta—a name equally appropriate—at a dollar a plant; although I cannot account for the increase in price unless it is owing to its being nearer the "Hub." I would not here allude to Henrietta as being a synonym of Belle de Fontenay, had I any doubts of its identity, supposing, as I do, that its disseminators are ignorant of its being an old variety under a new name. Being "sold" myself, however, when the proprietors of the Henrietta sold me the plants, I desire that my loss may be the gain of the readers of the RURAL, hence note the above.

I will also state that the belief expressed in the RURAL, a year ago, that Norwalk seedling was identical with Naomi (Franconia) and Early Andrews with Highland Hardy, has been proved conclusively the past season.

THE NEWER RASPBERRIES IN OHIO.

M. B. BATEHAM.

The culture and use of Raspberries have increased largely in Ohio and in most other States, I believe, during the past few years. There has also been a noticeable improvement in the quality as well as in the quantity of this fruit in most of our city markets; and as more skill and system have been applied to its culture the price has been reduced in the markets, so that all classes can afford to use them, and raspberries are now counted among the fruits for the million, and indispensable as following strawberries, and preceding the larger fruits of summer.

In the south-western quarter of Ohio the culture of Raspberries, especially of the Black-cap class, is most extensively carried on. From Cincinnati, Dayton, and other points, many thousands of bushels are shipped each season to places north and east, where the soil and climate are less favorable. The crops of this fruit are more reliable, and the prices more uniform and more remunerative, as a rule, than those of strawberries.

Several of the improved varieties of

BLACK-CAP RASPBERRIES

had their origin in southern Ohio. Among these, the Ohio Everbearing, and the McCormick, or Mammoth Cluster, are the most noted. Both are chance seedlings of the native variety, Rubus occidentalis; as are also the older improved sorts, Doolittle, Davison's Thornless, Seneca, etc.

The Mammoth Cluster all of our market raspberry-growers have come to regard as the best of all varieties for their purpose; though some of them grow a few of the others on account of their ripening a little earlier. For home use, also, they are preferred by some people, and they seem to succeed better in some localities.

The Gregg is the newest of this class of Raspberries and, within a year or two, has created quite a sensation among our large growers, as promising to eclipse and supersede the Mammoth Cluster—the berries being of larger size, while the plant is equally hardy, vigorous and productive. It was first discovered growing wild, in Indiana, by a man named Gregg, who commenced its propagation and growing the fruit for market, where it was observed by our wide-awake fruit grower, Nick Ohmer, of Dayton. Noticing that the berries on sale were of larger size than his well-grown Mammoth Clusters, he at once set about finding where they grew and, on visiting the grower, he engaged a supply of the plants to be sent to him. On fruiting in his own grounds, he found the variety more distinct and valuable than he had expected, so that he extended his plantation of it as rapidly as possible, to the extent of about ten acres. Several other Ohio fruit-growers also planted it so as to test its fruiting the past season, and all agree in placing it at the head of the list of Black-caps, and count it a decided acquisition for market berry-growers. It resembles the Mammoth Cluster in growth and habits of plant and in appearance and quality of fruit, excepting that the berries are one-third larger; and as the number and size of seeds are the same, there is an increase of pulp and juiciness.

Of the

RED OR ANTWERP

class of Raspberries there is also some increase of culture and demand around our cities; but as yet there has not appeared any variety that is sufficiently hardy and productive with fruit of fine quality and firm enough to bear distant transportation, though several of the newer kinds are recommended as meeting these requirements.

On the score of hardiness, it is known that the native species, Rubus strigosus, from which many, if not most of our improved kinds have sprung, belongs to our most northern States; abounding in northern Michigan, and the adjacent parts of Canada, and seldom seen as far south as Central Ohio and Indiana. The European sorts are counted by botanists as varieties of Rubus Idæus; and this differs so little from our R. strigosus, as hardly to deserve a separate specific name. Seedlings of each are found to produce varieties so closely resembling those of the other, that no one can say with certainty to which species they belong, and hybrids or crosses between them, are believed to have been often produced. The growth and habits of the plants, and the size and quality of the fruit are so greatly affected by climate, soil and culture, as often to mislead observers in regard to their identity and real character. Hence it is not safe for any one to invest largely in a new variety, until it has been tested on his own soil, or at least in his neighborhood.

It needs also to be borne in mind that a number of the leading varieties found quite hardy in northern localities, as in Western New York, and Northern Ohio, Michigan, etc., will not endure the winters in central and southern Ohio, Indiana, and Illinois. This is owing to the fact that this species belongs to the north, as before stated; and when grown too far south, the leaves fail, and fall off during the heat of summer, so that the canes are not properly matured in the autumn, and hence the wood is unable to endure the oft-repeated freezings and thawings of a south-western winter. Persevering efforts, however, have partly overcome this difficulty, and one or two varieties of some merit are said to possess such vigor of growth and foliage as to withstand both the summers and winters of the southwest.

Clarke, I think, was the first real step in this direction; but it soon proved unreliable as to productiveness, in most localities, and the fruit was too soft for transportation, while the plants multiplied so profusely by suckers as to become a pest to the growers.

Turner is an improvement on the Clarke. It is equally hardy and more reliable, and productive, with firmer fruit, rendering it a profitable market sort, even in southern Illinois. It has not, however, succeeded as well in Ohio, and its profuse suckering is a serious fault.

Thwack comes next, with its jaw-twisting name—originating as far south as Missouri, and promising to stand all sorts of hardship of climate, with the fruit abundant, of large size, good quality, fine color, and so firm as to bear transportation from St. Louis to Boston. What more can we desire! Perhaps this is the "coming" Raspberry; but still it is best to move slowly. Some of our Ohio men, who test every new thing, have fruited the Thwack, and do not care to plant largely of it. The plant is seemingly hardy and vigorous, as recommended, and the fruit is of good size and color. It is also quite firm, so as to bear transportation better than any of its class—but its quality is also poorer than that of any other, its firmness being simply owing to its lack of juiciness. If fruit of this character is forced upon the markets, the effect will be to disgust the people, so that they will refuse to buy any kind of red raspberries.

Highland Hardy has been tested in Ohio, and does not appear to differ from our old variety known as Kirtland, and sold as Red Antwerp in most of our markets. This, and another not as good, called Allen, are improved varieties of the native red. They are hardy in northern Ohio, and, with right soil and culture, prove very satisfactory for home use. They have also been grown for market considerably around Cleveland, but have mostly been superseded by the next, which is much their superior, and equally hardy.

Naomi is claimed to have originated near Cleveland, from seed of the Franconia, which is the hardiest of foreign varieties. Its resemblance to the parent variety is so close, that many pomologists regard it as identical with it. But our Cleveland growers insist that it is distinct, and more hardy and reliable. Be this as it may, for this Lake-Shore region, it is certainly the best of all the red Raspberries that we have as yet fairly tested—especially for near market and home use. A little more firmness of the berry, without any loss of size or quality, would render it almost perfect.

Herstine, and Hornet, are distinctly of the foreign class, of fine size and quality, but needing winter protection at the North, and unable to endure the hot sun at the South.

Brandywine, has been highly praised as a market berry, by our Eastern friends. It has been tested the past two seasons by several Ohio growers, and thus far they report favorably of it. The plant is hardy, and stands hot sun moderately well. Its growth is fair, and stocky, but not quite tall enough, except on rich soil, and the fruit, though fair in quantity, is not quite as large as is desirable. It is of good color and quality, and so firm as to bear carriage better than most others of its class.

Delaware, I have not yet seen fruited; plants were set last spring by several Ohio men, and another season will give us fruit.

Pride of The Hudson is too long a name, but we will excuse that if its character proves what is promised. Specimens of the fruit sent to me by mail last summer, were handsome and good, but not more so than some of the older sorts.

Lake Co., Ohio.

PLANT RASPBERRIES IN THE FALL.

REV. E. P. ROE.

I have always had much better success with Raspberries set out in October and November than with those planted in spring, and with good reason, I think. In the first place, there is leisure in the fall to thoroughly prepare and enrich the ground, and when this is done properly, one of the most important conditions of success is secured in advance. In the second place, although the plants do not grow in the fall, the *roots do*. The rains settle the earth around them; they take hold of the soil at once, and thus the plants are ready to start with great vigor as soon as spring opens.

In the third place, the buds just above the roots, which make the new and bearing canes for the following season, are small and dormant in the fall, but they start very early in the spring. In spring planting, therefore, these buds are often broken off, even under the best of care. The plants thus, in many cases, receive a serious check and there is much delay in securing a fine stand of bearing canes.

My method is to deeply plow and cross-plow my raspberry ground in the fall, enriching the land according to the requirements of the variety planted. Some of the best kinds tend to fruit rather than to sucker, and need high stimulation, as for instance the Pride of the Hudson, which will load itself like a Bartlett pear tree. Other excellent kinds, like the Cuthbert and Herstine, will do well with less manure, but all kinds require deep, mellow soil for the best results. I next set out my plants four feet apart each way, putting two or three roots in a place, according to the vigor of the kind. The tendency of raspberry hills is to rise too much above the surface, so I set the plants about three inches deeper than they grow naturally in the propagating bed or patch. After treading the ground firmly down over the roots, I direct that one or two shovelfuls of the oldest and finest manure I have be thrown on and immediately around the hill. The fall and early spring rains carry the richness of this manure down to the roots, and thus the plants at the start are given a vigorous "send-off" on a successful career. Many a plantation is feeble for two or three years for the lack of good, generous treatment in the beginning. Just before the ground begins to freeze, I mound the earth over the hills and early in spring, after hard frosts are over, level it down again. In large plantations this could be done, in the main, by plowing a furrow against the row on either side. I have never lost any plants thus protected against the frost, and have always found that plants thus planted in the fall made almost double the growth of those set out in spring.

SMALL FRUITS IN CALIFORNIA.

W. C. L. DREW.

RASPBERRIES.

Raspberries are less extensively cultivated in California than any of the other small fruits. The supply is never equal to the demand, and, accordingly, they always bring a remunerative price. No fruit succeeds better in our immediate section than the Raspberry. They are always pretty sure to produce a crop. The only objection to them is the short period of their duration. Our growers do not care to grow anything, unless it is in season for several months. On this account the Raspberry has been much neglected.

The Herstine is by odds the best. It combines the most desirable qualities requisite in a family, or first-class market berry for shipping, while its superior flavor, brilliant scarlet color, large size, firmness and great productiveness make it a most desirable fruit.

Doolittle is a favorite variety. It bears very early and is remarkably productive. The fruit is large and firm and of fine flavor. It is our earliest bearer, being quite over before the other varieties ripen.

Mammoth Cluster is a good variety frequently cultivated. It is a fair family berry, but not much adapted for shipping.

Other varieties are not as yet sufficiently well acclimated for me to give a satisfactory report, as a variety which proves desirable this season may be entirely worthless after a few seasons' growth, and *vice versa*.

BLACKBERRIES.

The Blackberry is extensively grown in California. It is justly a general favorite. It requires thorough irrigation from the time the fruit sets, about the close of our rainy season. It may be continued in bearing for several months by proper irrigation. No fruit is more injured by ill treatment, for, if kept for two or more weeks without its accustomed irrigation, from one-half to two-thirds of the crop will be ruined. The varieties in general culture are the Kittatinny, Lawton, and Wilson's Early.

The Kittatinny is the best. It is extremely hardy, the fruit is of a most luscious quality, large size and fine form. It is very productive. It is a general favorite with growers, both for family and market purposes.

The Lawton is grown very extensively. It is a good bearer, is hardy and of good fruiting qualities. It was, at one time, the standard variety in California, but it is gradually giving away to its rival, the Kittatinny.

WILSON'S EARLY is a good variety, but it is not as popular as the other two sorts.

CURRANTS.

The Currant is a popular fruit. Until recently, however, it was not in general cultivation here, but every season sees it more extensively planted.

THE CHERRY is our best and most popular Currant. It has many good qualities; it is notable for its productiveness and large size. In flavor it is very tart. In some sections it is raised extensively for making jelly, for which purpose it is unrivaled. The large size and fine red color of the fruit make it very attractive in the show windows, in the market or on the table.

BLACK CURRANT AND BLACK NAPLES CURRANT are seldom raised by our growers, as their peculiar musky flavor is relished by few. Not many years ago they were quite popular for jellies, but they have given way to the favorite "Cherry."

THE WHITE GRAPE CURRANT is grown in considerable quantities, being highly appreciated for the table and hand eating, having a pleasant and not very acid flavor. It is not a great or prolific bearer.

Where well grown, cultivated and manured, the Currant is a profitable and valuable crop and always quite certain.

Eldorado Co., Cal.

NOTES FROM RURAL GROUNDS.

RASPBERRIES.

THE flavor of raspberries is of less importance than that of most other fruits small or large. The characteristic raspberry flavor is neither very sweet nor very sour. Those who do not like the fruit, call it insipid. Indeed, if we were to take a plate of each of the popular red sorts and sprinkle over them the same quantity of pulverized sugar, there are few who, after the first spoonful or so, could determine one variety from another. In selecting varieties, therefore, hardiness and fruitfulness are to be borne in mind before flavor, and, if raised for market, of course, firmness must be added.

THWACK.—We have already referred to this new variety as one of much promise. Mr. Roe, whose opinion respecting small fruits, is entitled to respect, tells us, as the RURAL has already stated, that he considers it "a weed." But if we were to accept the opinions of others respecting the value of varieties, there would be little need of testing them ourselves. On those grounds this variety must be placed among the most valuable of Raspberries, judging it by our two years' experience. One dozen plants were sent to us by A. Hance & Son, of Red Bank, N. J., with the usual request that we would test and report. All lived and produced a considerable crop the first season. This year the plants have made a rank growth. The canes are strong, upright, and nearly thornless. The bushes are compact, the leaves large and healthy, and they are retained long after most others have fallen. The berries are as firm as those of any variety we have ever seen. The flavor, however, verges so closely upon insipid that, though fond of this fruit, we should not trouble ourselves to pick and eat them from the bushes, even though they were laden before our eyes. Nevertheless, as we have said, prepared in the usual way upon the table, one does not stop to make invidious comparisons. The color is red, the berry of medium size, borne less in clusters than distributed with some regularity over the entire bush.

MONTCLAIR.—The Messrs. Williams, of Montclair, N. J., sent us, this spring, plants of their new seedling Raspberry, "Montclair." Half of these are planted here—half at the Rural Farm. Both lots have borne so well as to give, both there and here, a quart or more of berries. The berries are firmer than those of the Philadelphia, of which it is a seedling, and of the same or rather better quality. Further than this we have no right to speak from one season's trial. The trustworthiness and horticultural experience of the gentlemen upon whose grounds the "Montclair" originated, are, in our estimation, good evidence that it will prove worthy of general trial.

PRIDE OF THE HUDSON.—We received plants of this variety not until last spring. The canes have made a tolerable growth and bore berries of goodly size and excellent flavor.

HIGHLAND HARDY—Is with us, as in most other places, one of the earliest. It is also hardy and productive. But the fruit is rather small and of low flavor.

BRINCKLE'S ORANGE does well here. It was not protected last winter, and though most of our Raspberries were harmed by the frost, this yielded a fair crop.

REMARKS.—We have not less than forty varieties of Raspberries, old and new. Of the latter all has been said that we can say at present. Of the former we commend to our friends the following list:

BLACK-CAPS: Doolittle—Mammoth Cluster.

NATIVE RED: Herstine—Kirtland—Philadelphia—Brandywine.

FOREIGN: Franconia or Naomi—Clarke.

BERRY CULTURE IN TEXAS.

THE Raspberry is not cultivated to a great extent in Texas. The Antwerp varieties cannot stand the hot summer. The Black-caps are hardier, but they are much inferior in quantity, size and lusciousness, to the wild Dew-berries and Blackberries. They ripen almost at the same time, and nobody thinks of planting them, except that an amateur may, perhaps, set out a bush or two for variety's sake only. Moreover, blackberries are selling at five cents per quart, or even for less, in their season; and at that price there could not be any margin of profit for one that would embark in the cultivation of Raspberries. Gooseberries and Currants may, if special care is taken, live through one summer, but only to succumb to the next, without ever showing a fruit. Strawberries do tolerably well, if their culture is modified to suit the peculiarity of this climate. But it is astonishing how little this is understood, even by otherwise well-experienced gardeners. A plantation is generally made from suckers picked out from the old patch during the late fall or winter months. These suckers will bear a few berries the following spring, and these are considered their full crop. This same operation is repeated year after year, and nobody has an idea of improving upon it.

The best method I know of for cultivating the Strawberry successfully in this latitude is the following: In order to get strawberries, we have to raise plants that will produce them. To this end, in the month of May, when the plants have done bearing and their suckering period begins, the first well-established suckers should be picked out and at once planted in a nursery-bed about eight inches apart each way. This bed ought to be dug deeply and well-enriched with rotten manure or compost. Good drainage is essential, for the hot sun will scald and kill them, if on soggy ground. They ought to be watered in dry spells and the ground kept clean and loose. A little shade, when first planted, is beneficial; but, once established, it will be better to give them full exposure. They ought not to be allowed to throw out any suckers, which they will not do except in a very favorable season, since they have to expend all their vitality to endure the hot days of summer, which will be upon them as soon as fairly established.

Along in October and November there will be a set of fine, robust and well rooted plants, instead of those half-starved, tiny, long-for-life suckers, newly picked out of a grassy old strawberry-plot. At this time, they may be carefully lifted with a transplanting trowel, retaining balls of earth around their roots, and at once transferred to the place destined for them. It must be remembered that the Strawberry has to be raised here strictly on an annual plan, as old plants hardly ever live through the summer. Of varieties, the old Wilson is—everything considered—as yet the best of all. G. MARTI.

Harris Co., Texas.

RASPBERRY ITEMS.

In Rhode Island, Naomi (probably Franconia) Clarke, Brinckle's Orange, and McCormick, are especially prized.

The Turner has already many friends. Iowa makes favorable reports of it, as well as of the Doolittle, Mammoth Cluster, (McCormick), and Philadelphia.

HERSTINE RASPBERRY.

In Mississippi, the Antwerps are said to do only moderately well. The Black-caps are the most reliable. So they are everywhere, for that matter.

In Arkansas the Cap varieties do very well—and those only.

In Ohio, the Gregg Raspberry is said to be in every way better than Mammoth Cluster (McCormick). "Olds" a variety originating in the State, is also promising. The Thwack, is reported as of strong growth, and the fruit of good size, but poor quality. That's just what the RURAL has said for two years.

In Massachusetts the sorts mostly grown are Doolittle, Davison's Thornless, Mammoth Cluster, among the blacks, and the Franconia, Herstine, and Clarke, among the reds. John W. Adams says: Why raspberry culture has not kept pace in this State, with other fruits, is a mystery to many horticulturists.

Mr. Berckman's says, that Raspberries for Georgia, are restricted to three kinds, viz:—Doolittle, Imperial Red, and a nameless variety of the Purple Cane family. Somebody ought to give that variety a name.

Charles Downing says that the Henrietta is a very promising new variety, with most magnificent foliage. "Most magnificent," even applied to the foliage of a plant, is strong language for Mr. Downing. Mr. Lovett says that the Henrietta is Belle de Fontenay.

At the Rural Grounds, we regard Cuthbert, as one of the most promising of new sorts.

BLACKBERRIES.

M. OAKEY.

I ONCE overheard a back-country farmer remark: "Of all long-legged horses I ever see, he was the long-leggedest." So I remark of my Blackberries. Of all my experience in Blackberries, this year with me was the "blackberriest." Our last table supply was consumed Sept. 15th, but on Sept. 22d I had the pleasure of regaling the "angel of the household" with a heaping saucer of delicious and perfect fruit. On Sept. 1st I plucked a cluster of seven Kittatinny berries, three having already been taken off the same bunch, the smallest of which measured two inches in circumference. For nearly nine weeks I enjoyed an unlimited supply.

I have three varieties, the Kittatinny, Lawton and Wilson. The Lawton comes on the latest and the Kittatinny is the earliest and bears the longest. I picked three or four of them Sept. 22d. The Wilsons have not done so well with me and are not yet quite established. They promise well for next season, judging from present appearance. I have thirty-four hills of each variety and when they bloomed, last spring, they resembled cotton plants, and at dusk appeared as though paper had been thrown over them. The Kittatinny and Lawton varieties bore crops that I have never before seen equaled. The yield was seemingly too heavy for perfect ripening, but both matured an immense amount of fruit.

My method of culture is very simple. The plants were set out in inverted sod in 1876. This is, consequently, their third year. After they were set a shovelful of rich compost was thrown around each plant, and this was dug under a few weeks afterwards when the weeds began to grow. They were then cultivated two or three times during the rest of the summer. The next year, nothing more was done than to keep the weeds down and gather a very fair crop. Last spring (1878) a load of coarse manure was spread through them and afterwards dug under. They were cultivated twice until the fruit set, after which I never disturb the roots, believing it to be an injury both to the fruit and to the growing shoots. If the weeds get thick, sometimes I pull them out. As soon as the fruit is done with, the old canes are removed and the young shoots tied to the stakes which are set in each hill. I pinch back, when five feet high, but I very seldom restrain the side branches. Two or three canes only are left to the hill. These hills are six by four feet apart. Three days' labor stretched through the year at odd times when otherwise unemployed, and a load of manure are the cost of all the blackberries a large family can consume, winter and summer. It always seems to me to show great negligence on the part of farmers not to provide so cheap a luxury for their ofttimes scantily-supplied tables.

CULTIVATION OF THE BLACKBERRY.

One of the reasons why we see so little fruit on blackberry plants, is that they are not properly treated in the summer. As soon as the canes reach four feet in hight, the ends should be pinched off. This induces a strong lateral growth, which should also be pinched when a foot long. Care of this kind, will make compact, productive bushes.

Set the plants three to four feet apart, in the row, and the rows four feet apart. For field culture the rows should be seven to eight feet apart, It is often stated that rich soil is neither requisite nor desirable for the Blackberry. But the largest crop and the largest berries we have ever seen, were raised upon land that had been heavily enriched with barn-yard manure. In any event, the soil should be deeply plowed. The plants may be set now or in the spring. We prefer fall planting for both Raspberries and Blackberries.

BLACKBERRIES.

IN Arkansas Kittatinny is best. The Kittatinny and Lawton, are both cultivated in Florida with success. The Barnard is spoken of as very hardy and productive, in Iowa. In Kansas the Kittatinny is most reliable—the Lawton is more liable to be winter-killed. In Mississippi wild Blackberries are so abundant that the cultivated varieties are not much grown Lawton does well. In Oregon, Lawton is the favorite.

The Kittatinny is preferred in Mass., N. Y., Pa., N. J., Del., Ohio, Iowa, Nebraska. The Wilson's Early, thrives in Delaware, Kentucky, Nebraska, California.

GARDEN TALKS AND WALKS.

RENOCLAF.

THE BEECHES, Mass., Sept. 24, 1878.

A PRETTY IDEA—WATER-LILIES.

WHEN walking around the observatory at Harvard University the other day, I came upon two little pools of water in the grass. Water-lilies were growing in them, and around the margin the German Ivy (Senecio scandens) was in wild luxuriance, sending its vines covered with deep green glossy leaves, hither and thither among the grass. On closer observance I found the pools to be tubs plunged to their brims in the ground and filled with water. These lily pads in the lawn were part of Mrs. Pickering's brilliant, little flower garden; and Mrs. P. tells me the Lilies do splendidly, and from them, this summer, she has cut some dozens of blossoms. As Water-lilies thrive well under such circumstances, who loving them, need be without them?

SCARLET FLOWERS AMONG THE GRASS.

A novel but pretty way of using Tropæolum Lobbianum is in common practice around Boston. A tiny flower-bed, twelve or fourteen

inches in diameter, is made at the top of a bank or on the sunny slope of a lawn, and planted with these fiery Nasturtiums. As they advance in growth, the vines clad in scarlet blossoms, reach forth in all directions among the grass. The grass is not mowed, but merely switched over with the sickle, when it overtops the Nasturtiums. Such brilliantly studded banks attract considerable attention.

PROPAGATING THE VARIEGATED COBÆA SCANDENS.

Mr. Farquahar, gardener of Forest Hills Cemetery, called here the other day. "I put in a lot of cuttings of the variegated Cobæa scandens in heat, and after waiting some weeks, found no appearance of any of them rooting, but in a cool greenhouse, where I made the cuttings, a few pieces had fallen on the sand on the side bench, and there, uncared for, they were rooting nicely. I changed my tactics at once and put in a lot in a cold house, and they all rooted right-away." Just my own experience exactly, Mr. F.

SPRING BULBS GROWING IN FALL.

Iris Anglica, Susiana, Hispanica, and others of their class, are often considered tender and unsatisfactory generally; they do well enough the first season after being imported, and the following winter they die. And this is why: After they have blossomed and the flower-stems die down and disappear, we should see no more of them till they start afresh the following spring; but, alas! our fall rains affect them sadly, and they begin to grow in the fall, and thus succumb to our winters. To avoid this evil, I lift my bulbs in August, keep them cool, dry, and out of the ground till October or November, when I replant, and all is well; they survive the winter and blossom out beautifully in spring and early summer.

My neighbor, Dr. Walcott, learned this lesson by experience, and taught it to me. Owing to so much rains recently, I find my Jonquils and some other Narcissi are starting to grow; I have shaken out a few, for I cannot afford to lose them all. I appreciate them too highly.

THE BEST NEW FERN AT BOSTON,

Adiantum cuneatum, is the commonest greenhouse Fern in existence! A fact. The judges at the last annual exhibition of the Massachusetts Horticultural Society, said so! The plant was a very ordinary-looking one at best, but it belonged to the President of the Society, and he didn't deny its species either. Of course, Boston people would not submit to such an erroneous decision, so the judges were compelled to reconsider their award and give the first prize to him who before had got the second. It would, however, have been more Com(e)ly if rectified S(p)eoner.

THE BOSTON BABY SHOW

is in session just now. "One hundred proud mothers with their infant progeny, are platformed for the criticism of a generous public." Among the babies are five pairs of white twins and two pairs of colored ones. One pitiable infant, two months old, is thirteen inches long, and weighs only one pound! The children are of different ages—four weeks to two years or so. There are some nice, clean-looking and healthy children among them, but altogether, I could not see anything particularly attractive about them; in fact, though I dearly love children and made quite a fuss with several of these little ones, I must say that neither of the babes nor of their mothers was I specially enamored. I am strennously opposed to baby-shows. Curiosity took me there; so now I am convinced that the baby-carriages rolling along our streets and commons contain sweeter darlings—to non-relatives, at least—than are this week exposed to the public gaze in the Boston Music Hall. At agricultural shows we usually find superior specimens of the better breeds of cattle, horses, and other domesticated animals; but if you want to find babies you can kiss and love,—children, sweet, clean and bright, visit your neighbors' houses, and not the baby-shows. And if you want to see in woman that honorable pride, rivetting sweetness, delicacy and refinement so becoming in the cultured mother, I say again, visit your neighbors.

Entomological.

THE CABBAGE PLUSIA.

Besides the European Cabbage Worm that is so rapidly spreading over the northern United States, there is another caterpillar that is nearly as destructive. Like the one first-named, it is green, and about an inch in length when full-grown, but it may be readily known from the Rape-worm by the following characteristics: The Rape-worm has sixteen legs and moves along when it crawls with nearly a gliding motion, while the Plusia has only fourteen legs, and as a result, it loops up the back as it crawls, something like the Measuring-worm. Besides this, the Plusia has pale greenish-white stripes down the back, while as regards the Rape-worm, if it has any stripes that are perceptible without the use of a magnifying glass, they are yellowish with fine black dots.

This worm eats round holes in the leaves, beginning with the outer leaves, or those away from the head; but as there are usually quite a number of worms on a plant, these outer leaves are soon made to look as though a shower of hail-stones had passed through them, and, thus the outer layer of leaves that form the head, is encroached upon. Unlike the Rape-worm, these pests do not bore into the heart of the head, and as a consequence, they are not so destructive, but the injury they do consists more in eating the outer leaves, thereby limiting the growth of the plant, and making the outer portion of the heads unfit for use, owing to the presence of their excrementitious droppings. From observing both the Rape and the Plusia worms in my garden this season, I infer that they do not work well together; I could find great numbers of both kinds, but they were always on separate plants.

When full-grown, this caterpillar retires to some sheltered place, either between the leaves or elsewhere, and weaves a very thin, loose, white cocoon, within which it changes to a chrysalis, which is at first yellowish-green, afterward usually becoming brown. This is soft and tender to the touch, and has several curled bristles at the small end. In about ten days these produce moths that are of a dark-gray color, tinged with brown, with a bright silvery mark in the middle of the fore-wings, resembling an oblique interrogation point. The male differs from the female in having on each side of the abdomen, towards the tips, a tuft of golden hairs.

These moths, after pairing, deposit eggs at night on the cabbages, from which another brood of the worms is produced.

Remedies.—If the cabbage patch be small, or the infected plants few in number, to hunt the worms and kill them is a good remedy. As they usually fall to the ground when the plant is jarred, shaking the plant will be of assistance in finding them. Chickens, if allowed the range of infected cabbage patches, will destroy a great many of these pests as well as other insects. The use of any chemical preparation, unless it be a drenching of the plants with a solution of cresylic soap, is not advisable.

Carbondale, Ill. G. H. French.

Floricultural.

OUT-DOOR FERNERY.

ELLA RODMAN CHURCH.

An out-door fernery is a rare possession—a great bank of lovely green fronds that can be drawn upon at pleasure, and that diffuses an atmosphere of perennial greenness around its own particular corner, which may be the ugliest and shadiest in all the garden; for Ferns will flourish where nothing else will.

Exquisite Ferns of various kinds, called by the country people "brakes," are to be found in almost every moist woodland place, and are invaluable for pressing or arranging with cut flowers; but who wants always to go to the woods or brook for them, and who, unless armed with a botany-box, or great sheets of paper, can hope to bring them home without withering? Why not, then, have them close at hand, when the thing can so easily be done? And yet few people ever think of going deliberately to work to make an out-door fernery. If a rockery is erected, some few tufts of Maiden-hair and other wild fronds must, of course, be used to give it character; but gardeners rarely plant a fernery as they do an asparagus-bed, for the express purpose of cutting.

Some dismal, neglected spot in garden or grounds, some place where rubbish may hitherto have been dumped and where the dominion of noxious weeds has never been interfered with, may prove the most promising site that could be found for a plantation of Ferns. They are not at all difficult to raise and they thrive where no flowers would condescend to prosper; but certain requisites they must have, and one of these is moisture. They also like a corner underneath a wall and will smile in the face of a northern aspect; great, branching trees, too, to which flowers are always antagonistic, do not disturb them in the least.

Ferneries may be made of all sizes; but if a good generous one is wanted, a hank of earth three or four feet high should first be thrown up both as a dividing line and as a sort of breastwork against the roughest winds. A pathway should carefully be left leading directly into it from any point of the compass, that may be most convenient. Shrubs that develop well in the shade, may be planted on the top of this bank with quite an ornamental effect; while the Ferns will do better on the sides. The outline of the bank must not be straight, but furnish points and hollows for the better distribution of the Ferns, and the inside must be furnished with a generous supply of burned bricks or blocks of stone. If there is a wall at the back or on one side of the structure, either masses of burrs (bricks that have run together in the burning) or pockets and brackets of cement may be fastened upon it at intervals to great advantage, as Ferns of a creeping nature, as well as other plants not strictly classified under this head, will grow there and daintily clothe and hide the naked stones, besides giving an additional element of beauty to the whole arrangement. For even if the fernery is just planted for cutting, it may as well be beautiful.

The central portion, if large, can be divided into several beds; but if small, one will answer. This can be done by making divisions with mounds of earth and bricks; striving, not for evenness of outline, but for the utmost irregularity, as this produces the most picturesque effect and also affords the most space for Ferns. The stones or bricks must not be too thick, or the fernery will subside into a rockery. A few small rough logs or branches can be mixed in with a very pretty rustic effect; and small Ferns, or creepers, will appreciate this provision for their comfort. Holes should be sunk in the crevices between for the benefit of those that are accustomed to a liberal supply of moisture. Their own native soil is undoubtedly the best; but Ferns will do well in a made soil composed of loam, peat, or leaf mold, and river sand in equal parts.

Great care should be taken not to wedge the plants into small crevices; and in planting, to consider their various needs. Tall, upright Ferns require depth of earth to flourish in; those that have surface creeping rhizomas want something to cling to; and those with underground, spreading rhizomas demand room and space to develop their individuality. Proper drainage also must be provided for, as superabundant water will injure the roots.

Ivies are never out of place anywhere; and the fern pasture may be beautified by rough arches of burrs covered with these climbers, or a column of stones may rise here and there with the trail of the Ivy over them all, and the dainty perennial green of its fresh shoots gleaming out like lingering touches of spring.

THE NATIVE FLOWERS AND FERNS OF THE U. S.

Parts IX, X, XI, XII, which we believe complete vol. 1st, have been received from the publishers, L Prang & Co., of Boston. The general excellence of this fine work is fully maintained. Indeed from the cursory examination which we have given the present parts, the colored plates are even better executed than those of the preceding numbers. Those of Part IX, are Viola sagittata; Gerardia pedicularis; Calochortus lutens, and Iris versicolor. Of Part X, they are Pogonia ophioglossoides; Cleome pungens, of which, it will be remembered we offered seeds in our last year's seed distribution; Actinomeris squarrosa, and Claytonia Virginica. Those of Part XI, are Asplenium Trichomanes: Anemone Caroliniana; Rosa Carolina, and Pachystima Canbyi.

Mr. Meehan has thus far accomplished the difficult task of rendering this work interesting to both the amateur and botanist.

Miscellaneous.

ABOUT INDEXES.

B. PICKMAN MANN.

When I sent to the Rural New-Yorker my criticism upon its indexes, which is printed on page 457, I was not mistaken in relying upon the candor of the editor for a hearing, and when I turned over two pages I was gratified to read that the editor was in accord with me in his estimation of former indexes and had already announced his intention to give the index more care and elaboration in the future than it had had in the past. While this intention is undoubtedly to be carried out in the excellent manner which characterizes the rest of the present volume, it may be well that the readers, generally, should be shown at least a part of the internal anatomy of an index, in order that they, too, may be in a situation to make, in the best manner, their own indexes of works which have no index, or which have an insufficient one.

In the first place, the index should be arranged by the *significant* words, not by articles, prepositions or subordinate adjectives. Taking as example the references quoted in my former article, page 457, the arrangement should be as follows:

Grasshoppers, to drive away..... 384
Hennery, pest of the..... 41
Hickory scolytus, the..... 174
Potato beetle, fighting the..... 32
Potato bug, exterminate the..... 384
Potato enemy, new.....48, 64
Power, wonderful, of an insect..... 318
Tomatoes, ten-liners on..... 174
Vines, American, in France..... 332

Here I have attempted no other reform than the transposition of the words and the arrangement of the lines in accordance with that change. I doubt not it will be admitted that in this manner articles upon given subjects are made more accessible than if the references were arranged as on page 457. It will be noticed that some of the references on page 457 have not been repeated in the above list. This is because there was no meaning in them. To get at the gist of the article which had for its title "'A little learning' not always 'a dangerous thing,'" we must amend the title to read in some way like the following:

Apple trees, borers in, means against..... 70
Borers in apple trees, means against..... 70
Saperda bivittata, means against..... 70

It is the duty of the editor, as an artist, to embellish the articles with graceful titles, but the indexer must be an anatomist and call things by their strict names.

A further improvement in an index is to reduce the number of unmeaning variations as far as possible, thus, for instance, to use one form of expression for the extermination of insects, somewhat as follows:

Grasshoppers, means against..... 384
Potato beetles, means against. 32, 384
Potato, insects injurious to.....48, 64
Tomato, potato beetles injurious to..... 174

The same things should not be called by different names. Grasshoppers and locusts are really distinct families of insects, but in common talk their names are mixed. Everything which is said about "grasshoppers" on page 457, refers to locusts. It may not be thought best, however, to ignore the word "grasshopper," and the indexer may choose to take the words as they come. In this case a line should be added to the index where each of these words appears, directing attention to the other word, thus:

Grasshoppers, a visit from..... 235
" Congress and the..... 249
" [See Locusts.]
Locusts, Rocky Mountain..... 156
" Western.....202, 203
" [See Grasshoppers.]

This rule is of general application. Wherever different words are used for the same thing, reduce the variation as much as possible, and wherever two subjects approach so closely as to overlap on their boundaries usually, send the reader to the other subjects by a note like that given above.

Next in importance to the rule that only significant words should be used as a guide in the index, is the rule that there should be only one alphabetical series. It may seem as if a person, turning to the index, would be saved a great deal of trouble by finding all the articles in which he is interested grouped under one head. Thus a poultry-raiser would look under the heading Poultry-yard, and need not trouble himself to look through the other columns. This field of search would be one easy to scan. But in fact, by no arrangement except by frequent repetition could all in which he is interested be brought together in this column without being taken away from some other place where it properly belonged. Take for an example the index before me. The first words in each reference below are the headings, of which there are thirty in the present index, each with its separate alphabetical series of references.

Dairy husbandry. Butter and Egg Ass'n..... 263
Domestic economy. Eggs, packing for winter use. 235
preserved by silicate of soda..... 267
to test..... 235
Industrial implements. Corn-sheller, home hand. 360
The Centennial. Poultry [etc.] 197, 310

Perhaps no one of these references is generally important, but if the searcher happens to want one of them, it becomes to him very important. Were all the references in one alphabet, he would make out a list of the words to be looked for, say chickens, corn, ducks, eggs, fowls, geese, hens, poultry, turkeys, etc., and look for these nine words or for such others like them as he might think of, and be satisfied with a short examination of the index, that he had found all that was to be found; but were the index divided into chapters, he must look for these words over and over again in the different chapters, thus making his examination ten-fold or twenty-fold more laborious.

To sum up the few points treated above I repeat: Make the index in *one* alphabetically arranged series, using as the leading words those which will be most likely to be looked for by any person who is seeking an article upon the given subject, and say the same thing every time in the same way.

WHAT OTHERS SAY.

Mr. Parry says, in an address to which reference is made elsewhere, that

RASPBERRIES

commence to ripen before strawberries are gone, and it is usual to send some of each to market at the same time. They come with harvest, when it is not entirely convenient for grain farmers to be bothered with small things, hence they are not grown so plentifully as strawberries and consequently sell better in market.

One farmer, near where he resides, sent to market a one-horse wagon load of raspberries and received $220 for the lot. One lady near-by, rented out her farming land, while her husband was from home, reserving a patch of Raspberries and Blackberries, from which she sold this year, 43,000 quarts, or 1 343 bushels of berries, worth several times more than all other crops on the farm. He once visited a farmer who paid attention to small fruits as well as to the more important staple crops of grain and grass. The day he was there they gathered for market 200 bushels of raspberries and some days did more.

His firm raised and marketed this year at Pomona Nursery, of

Raspberries	34,306	quarts.
Strawberries	25,509	"
Blackberries	11,016	"
Total	70,825	"

Of Black-Caps, Doolittle's Improved and Mammoth Cluster have given good satisfaction, but are now likely to be superseded by the Gregg, a new Raspberry, lately introduced, and a decided acquisition, being the largest, best and most productive black Raspberry known, fully fifty per cent. larger than the Mammoth Cluster, and one of the most valuable to plant wherever black Raspberries are desired.

Yellow Raspberries have not been popular, owing to the fact that hardy varieties have not been of good quality, and those of good quality, like Brinckle's Orange and Col. Wilder, were not hardy.

Caroline, claimed to be a cross between Brinckle's Orange and the Catawissa, is a large, luscious berry, of orange color, good quality, and it appears so far to be perfectly hardy, propagates both from suckers and tips, though sparingly from either. It promises to be the most valuable Raspberry of a light orange color yet introduced.

Red Raspberries are more desirable for the section about Cinnaminson, N. J., and the most prominent among them since the old Purple-Cane of fifty years ago, are the Philadelphia, an accidental seedling found growing in Pennsylvania about the year 1840, and seedlings grown from it, such as Herstine, Early Prolific and Reliance, all berries of merit. The Pearl, Turner, Bristol and Brandywine have been and still are largely grown. The above-named varieties have probably produced more red raspberries for market in his section than all others. The Pride of the Hudson, Henrietta and Norwalk Seedling are all very large handsome fruits in their native soils where they originated, in New York and Connecticut, but it does not follow that they will stand the hot, dry summers of New Jersey. As many other varieties that did well at the North would not succeed further South, the success of these there can only be determined by further trial.

BLACKBERRIES

commence soon after raspberries and give continued employment for the same pickers, crates and baskets that were required for strawberries and raspberries, so that all three may properly be grown on the same farm, and thus divide the cost of crates, baskets and other fixtures among them.

At the average price at which blackberries have been sold in market for twelve years past, a field with ordinary treatment will yield from $200 to $300 per acre annually. Double those figures have been realized some years. He has known 150 bushels of blackberries to be grown acre, which, sold at an average of 12½ cts. per quart, yielded $600 per acre. One of his neighbors planted 75 acres of Blackberries, which yielded, one year, 6,500 bushels of fruit and sold for $22,000. The blackberry crop of Vineland, N. J., this year, as reported by the railroad officials who carried the fruit to market, was about 500,000 quarts, equal to 15,625 bushels, and at 1½ cts. per quart for picking, the laborers who gathered the fruit received $7,500.

He has grown more than fifty varieties of Blackberries, and those that have proven most profitable are the Lawton, Dorchester, Kittatinny and Wilson's Early. Recently several new ones have been planted which promise well, such as the Snyder, Taylor and Wallace.

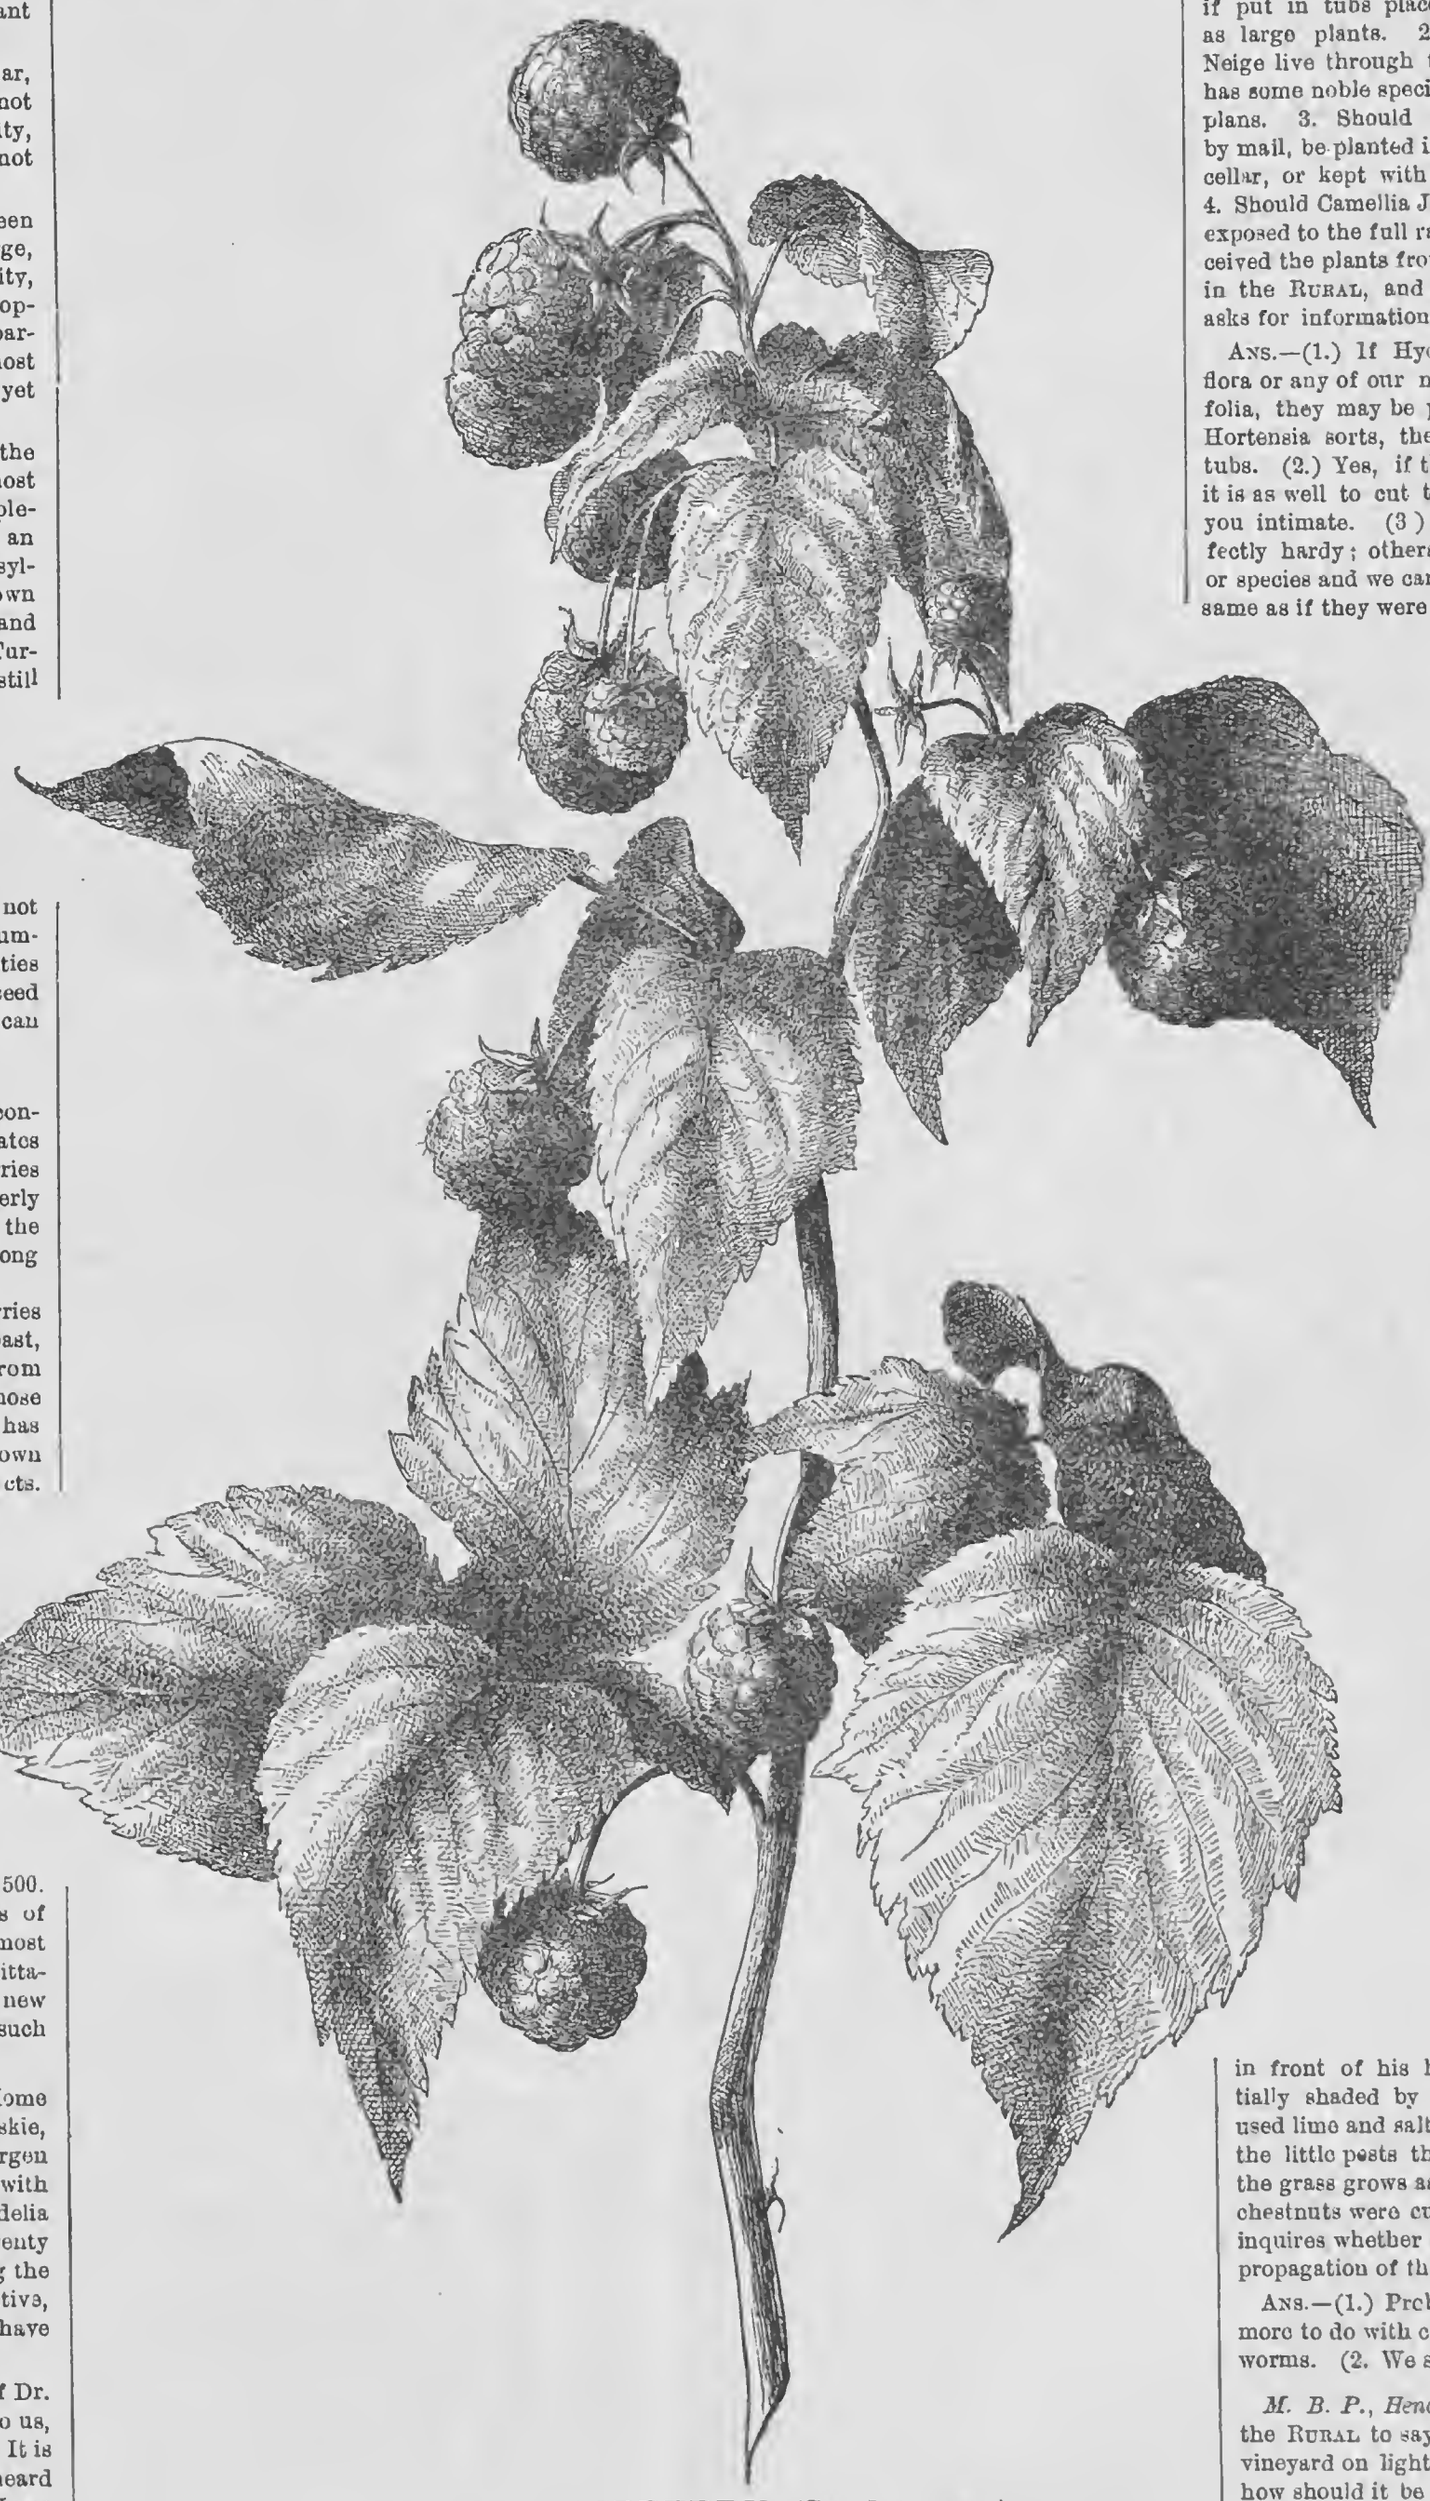
Grindelia Squarrosa.—The Farmers' Home Journal (Louisville, Ky.,) says: "Dr. Zabriskie, a well known physician of Westwood, Bergen county, N. J., tells us that he has used with much success the fluid extract of Grindelia squarrosa for malarial fevers, in doses of twenty drops, administered every two hours during the intermission of the fever. As a preventive, twenty drops, taken three times a day, have proved effectual."

[We ask the editor of the Home Journal if Dr. Zabriskie *did* tell him that? He told it to us, and the Rural New-Yorker published it. It is one of the strangest coincidences we ever heard of that he should have told it to the Home Journal in precisely our language. It must be considered, too, that Dr. Zabriskie was not aware that that excellent journal or its enterprising editor had any existence. Besides the febrifugal properties of the roots of Grindelia squarrosa, the plant bears a very pretty flower, for both of which reasons we are trying to save seeds enough from a small plot in the Rural Grounds to make it one of the dozen or more varieties of seeds to be offered in the Rural's free seed distribution.—Eds.]

Turner Raspberry.—Mr. S. Miller, of Missouri, says of the Turner: "It is this day worth more than all the rest put together. It just fills the bill—large size, brilliant color, immensely productive, firm as any, with a sweet spicy flavor, unequaled by any other we know of, and perfectly hardy."

We endorse all of it. Why pay from $1 to $1.50 for one plant of new, untried kinds, when you can get all you wish in the Turner at a reasonable rate? We think it will be the standard red variety for the South and West. The fruit brought this year 20 cents a quart, average, while Black-caps only averaged five cents.—*Farmers' Home Journal.*

Raspberries.—Thus speaks the experienced Col. Freas, of the Germantown Telegraph:



MONTCLAIR RASPBERRY.—(See 1st page.)

1. Hornet; 2. Herstine; 3. Philadelphia; 4. Brandywine. The Herstine has proved itself to stand in the front rank among Raspberries in quality and productiveness, but requires winter protection. In other respects it is not to be preferred to the Hornet, which is larger and the quality quite as good, with the additional advantage of keeping in bearing *nearly three times* as long as the Herstine. The Brandywine, as a market fruit, is coming into much notice.

Blackberries.—The following is his list of Blackberries:

1. New-Rochelle; 2. Missouri Cluster; 3. Wilson's Early. The Snyder, a new Western Blackberry, is highly spoken of at distant points, but we prefer to wait another year before recommending it.

The distinguished pomologist, J. J. Thomas, gives the following rules for the culture of Raspberries:

1. Any good strong soil that will raise good corn, and which has been deeply pulverized, will raise good Raspberries.

2. Set the plants in rows that will admit of free cultivating, say five or six feet one way and two or three feet the other.

3 For Black-caps, pinch back early or when the young canes are about two feet high, to keep the bushes snug and compact and to obviate staking.

4. As the canes grow in one season and bear the next, cut the bearing canes away as soon as they drop their leaves, or never defer the work later than early the succeeding spring.

5. Suckering sorts, to bear well, must have the suckers hoed away when they first appear above the ground or be treated like weeds.

6. Increase the crop by clean mellow culture, and, if practicable, by mulching for winter as well as for summer.

Relative Importance of Some of the Small Fruits:—1st, Strawberries; 2nd, Raspberries; 3rd, Currants; 4th, Blackberries; 5th, Gooseberries.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Owing to the considerable space given to the Raspberry, we ask the indulgence of those who have asked questions not yet answered.—Eds.]

Queries about Flowers.

John J. Watson, Newport Co., R. I., asks, 1. Whether Hydrangeas, mailed by florists this fall, will be better and larger plants next season, if kept with house-plants during the winter, than if put in tubs placed in the cellar, the same as large plants. 2. Will Abutilon Boule de Neige live through the winter in a cellar. He has some noble specimens, too large for house-plans. 3. Should Clematis plants, received by mail, be planted in the open ground, put in a cellar, or kept with house-plants until spring. 4. Should Camellia Japonicas that are budded, be exposed to the full rays of the sun. He has received the plants from two florists who advertise in the Rural, and as they are new to him he asks for information.

Ans.—(1.) If Hydrangea paniculata grandiflora or any of our native sorts, like H. quercifolia, they may be planted out now. If of the Hortensia sorts, they will do as well if kept in tubs. (2.) Yes, if the cellar is frost-proof; but it is as well to cut them back when as large as you intimate. (3) Some Clematises are perfectly hardy; others not. Name the varieties or species and we can reply. (4) Precisely the same as if they were not budded.

A Novel Strawberry Bed

Mrs. Robert C. Kerr, Cobb Co., Ga., says that the yard to her town house is not large enough for cultivating fruits *and* flowers, so that the lot is set out with the latter; but as she is anxious to enjoy home-raised strawberries, she asks the Rural's advice about raising them in the following way: she is thinking of getting two or more barrels, filling them with good rich soil, boring holes all around the sides, and planting strawberry roots in these holes as well as on the top of the earth in the barrels, which would then be placed in her greenhouse. She asks whether this plan would be likely to be successful; what kind of roots would be the best; how many would be required for each barrel, and what would be the best time for planting them.

Ans.—We do not think the plan would work. More berries could be raised in pots or in an earth bed of the greenhouse in the same space which the barrel would occupy.

Miscellaneous.

An old Subscriber, Onondaga Co., N. Y., asks: (1.) How can he exterminate angle-worms from the lawn in front of his house—north side—and partially shaded by two chestnut trees. He has used lime and salt, scdded and seeded, and still the little pests throw up their earth-works and the grass grows as thin as ever. (2) Two Horse-chestnuts were cut down two years ago, and he inquires whether their decaying roots favor the propagation of this insect nuisance.

Ans.—(1.) Probably the Horse-chestnuts have more to do with causing slender grass than the worms. (2. We should say not.

M. B. P., Henderson, N. C., asks, What has the Rural to say of applying chip manure to a vineyard on light, sandy soil; and, if advisable, how should it be done—broadcast or as a mulch about the vines?

Ans.—We should not use chips either as manure or mulch for vines or any other plants, unless thoroughly rotted.

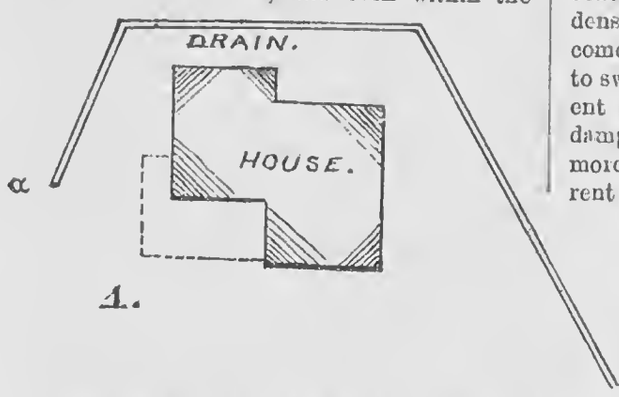
Farm Topics.

SANITARY ARRANGEMENTS FOR THE HOMESTEAD.

A JERSEY FARMER.

NO. 1. THE CELLAR.

In many cases, the deadliest foes to our comfort and health are permitted to lurk within our dwellings or in the closest proximity to them. Just as there are few people who are perfect in every way, so there are few houses that are perfectly clean. In front, and even within the

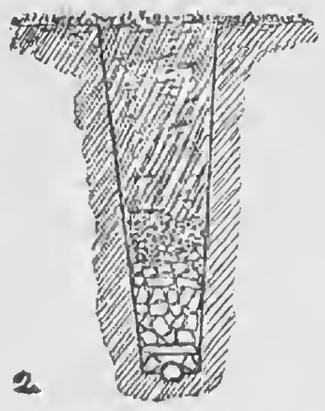


1.

house, it may be scrupulously neat and clean, but the back yard or some attachment thereto may be in a very objectionable condition. The weak spots about country houses are the cellars and the back yards. From the nature of things, it is difficult to keep these in a satisfactory condition. There are good housekeepers who are discouraged about their cellars, especially the present season, which has been unusually warm and damp. Nearly every cellar is damp and moldy, else it is close and has a smell of the earth, earthy; and to begin at the bottom of the question of sanitary arrangements of the homestead, the cellar naturally comes first. Without any preaching about what cellars ought to be, and what they are, let us consider how a cellar may be made dry, cool and airy; for a dry, cool and airy cellar is what every housekeeper knows to be perfection in the cellar way.

IS DAMP CELLAR

is damp either for want of drainage or of sufficient or proper ventilation. Ventilation is easily provided for by due attention to the laws which regulate the condition of the atmosphere, but to effect complete drainage is sometimes very difficult. When the house is situated upon a hillside with a clay subsoil, water often comes from the ground above, and rises from the bottom of the cellar. It is an easy matter to prevent this. A deep drain carried at least two feet below the level of the cellar, so as to cut off the water flowing from above, will cure the evil at once.



2.

But the drain should be carried at least twenty feet upon each side of the house to prevent a lateral inflow of water. The drain should be dug about twelve feet from the house. A plan of a drain properly laid out for this purpose is given at figure 1. The drain should be begun at the point *a* and carried in the direction indicated to *b*, which is the outlet. Obviously the direction may be changed to suit the character of the ground without detriment, if the house is cut off from the soakage of the water from the high ground.

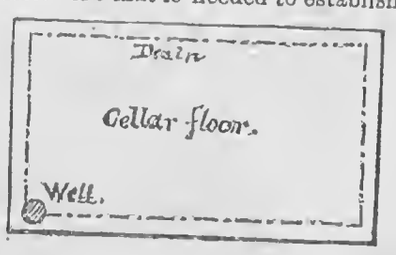
The drain should be made narrow at the bottom and scooped out to fit the tile which should be at least two inches in diameter. A three-inch, or even a four-inch tile would be better because this drain may be made the key to a complete system of drainage, not only for the cellar, but for the overflow from the roof and from the kitchen. The benefit of such a thorough system will be apparent to every thoughtful owner of a house. The drain should then be partly filled with stone for two or three feet, and with gravel for another foot; then filled in with earth. This will effectually cut off the flow of water. (See fig. 2) Where it is impossible to make such a drain, a wet cellar may be dried by sinking a well in it, and laying a feeding-drain all around the cellar to conduct the water to it as shown at fig. 3. The drain should be at least 18 inches deep and the well six or eight feet. This well should be bricked or stoned up, and covered with a flat stone or arched over. If a pump is fitted into it, it may be made very useful in the kitchen above, if only for washing and cleaning purposes. If a force pump and 100 feet of hose with a nozzle are provided, the washing of the windows, with some watering of the garden, may be done very convoniently. It may be very useful when the water is only occasionally present in the cellar, to carry the well down to a permanent spring, and so have a constant supply. By covering the well, the cellar will remain quite dry; but if it is left open, dampness will be certain to proceed from it. But dampness may, and does, very frequently result from

IMPROPER VENTILATION.

Consider a case. The cellar must of necessity be the coldest part of the house. The walls being of stone or brick, are non-conductors of heat. In the summer time the outside air is much warmer than that of the cellar. The warmer the air, the more moisture it contains. The cellar windows are opened. The warm air flows into the cellar carrying in the moisture contained in it. The cool floor and walls condense this moisture as soon as the warm air comes in contact with them, and they soon begin to sweat; that is, the moisture becomes apparent upon them. The housewife seeing the dampness, fears the cellar is close and needs air; more windows are opened and a stronger current is drawn in, perhaps at noonday, when the air is warmest, so that the cellar may be dried most effectively. The moisture is then greatly increased and streams pour down the walls and flow upon the floor, until mops are brought into requisition and the wondering housewife is at her wits' ends. This is a very common mistake. But the trouble might have been avoided by knowing

HOW TO VENTILATE A CELLAR.

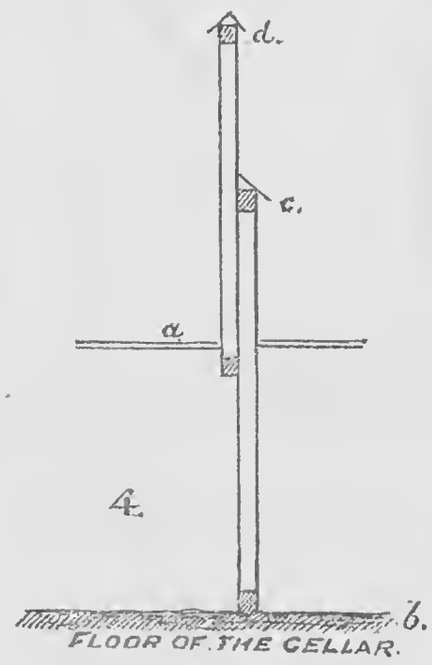
For all ventilation there must be a current inwards and one outwards. Wherever air is still, the coldest air is at the bottom and the warmest air at the top. The tendency of cold air, which is heavy, is to sink, and of warm air, which is light, to rise. All that is needed to establish an



3.

air current, is to make an opening near the bottom and another at the top. The warm air rising flows out at the top, and the cold air of necessity flows in at the bottom, or, if cold air flows in, it forces the warm air out. Now we want cool, dry air in the cellar. The cooler the air, the drier it is, because as the air cools the moisture in it is condensed and becomes visible as dew or water. The air is cooler at night than in the day time, and it is also drier then as the moisture is mostly deposited as dew. In the early morning, as the air has cooled during the night, the moisture has been condensed and it is drier than at any other time. So that the best time to air the cellar, or indeed the whole house, is early in the morning. But the air should not be permitted to flow into a cellar from the surface of the ground because there it is saturated with moisture and is at what is known as the dew point. If it is taken about 12 feet above the surface it will be drier and will be free from many injurious germs which are carried about by air saturated with moisture

To admit the air at this point, and also to afford an outlet for the warm and fouled air of the cellar to escape, a double pipe may be used. This may be a common spout of wood with two sections, each four inches in diameter. One of these reaches to the bottom of the cellar and one opens at the ceiling. The outlet of the first is from six to eight feet from the ground, and the other should be carried up to the eaves of the house. The spout may be fastened to the wall, in the rear of the house, and enter the cellar at the ground level or at a window. The openings are covered with wire gauze, to prevent access of flies or vermin of any kind, and the outside ones are protected by caps to shed the rain. The whole is shown at fig. 4; the ceiling of the cellar is at *a*; the floor at *b*; the lowest opening is the inlet for cool air, which enters at the opening *c*; and that above it is



the outlet for warm air, which escapes at *d*. Many mistakes are made in ventilating cellars for want of an accurate knowledge of the behavior of the atmosphere under different conditions.

A cellar was once ventilated by making a flue from the floor into the chimney, but the effort was a failure. The consequence was that the draft of the chimney drew the air chiefly by day, when the fire was burning, from the cellar floor, where it was cool, and its place was occupied by the warmer air from above, which entered through the numerous openings of the windows and the upper floor; thus, instead of being cooled, the cellar was warmed. If the flue had been made from the ceiling of the cellar and had been closed during the day, but opened at night, and a window had been partly opened at night when the flue was open, there would have been thorough ventilation, and the air would have been cooled as much as possible. When a cellar has become damp, it may be dried very rapidly by putting a bushel of freshly burned lime in it in a box. The lime will absorb sufficient moisture to dry the air of the cellar thoroughly, and when the lime becomes damp from saturation, it may be removed and spread upon the grass around the house or in the poultry yard for the fowls to peck at. The lime will also completely absorb any carbonic acid which may have been evolved from decaying vegetables; and, in short, it will be a very good substitute for ventilation, as it will both purify and dry the air. In this way it will pay very well to keep a box *half full* of lime in the cellar, at all times; the lime will always be worth its cost to use for making compost for the garden. The box should be only half full, because as the lime absorbs moisture it swells and falls to powder.

VAN'S VIEWS.

A week out with a thrashing-machine has shown that, while grain is not as bad as was at first reported, still it is a discouraging year. Yesterday we thrashed the grain from a twelve-acre field, on which were sown twelve bushels of Fife and six bushels of Club wheat; there was *no* Club at all, and just thirty-four bushels of Fife. This is an extreme; the average is about nine bushels to one sown, or twelve bushels per acre.

Oats are about an average crop and so is barley, but our rye, about which our farmers have been bragging so much, doesn't turn out very well, giving only about twenty bushels per acre.

One thing was brought to my mind the other morning, which I had almost forgotten, namely, that there is danger around a thrashing-machine. We were running on oats, and there had been a heavy fog during the night; straw, or rather loose oats, were scattered around the feeding-table, as is usually the case, and, of course, all were wet. The men took their places, the horses started, the machine began to hum, when, all at once, there was a cry near the door. The driver began to cry "whoa," the man who was feeding rushed in front of one of the teams and caught the horses by the bits, stopping the machine quicker than it was ever stopped before. We all rushed to see what was up, and found the bandcutter lying on his side with his leg twisted around the tumbling-rod. The wet straw had caught around the rod and twisted his pants up to where a few more turns of the rod must have either killed or badly maimed the man. I have seen men and boys step over the tumbling-rod at all points, over the knuckles as well as any where else, and I saw a girl walk over one of the knuckles one day, and though she escaped death, her danger was very great. Now, with folks thus careless, is it any wonder that there are, now and then, terrible accidents?

It is the same with mowers and reapers—how many drivers are there who always throw their machine out of gear before getting off the seat? I make it a rule to do so, but last summer in haying time I once got off in a hurry to free the sickle of dirt, and left it in gear: while pulling out the dirt and glass, one of the horses kicked at a fly; quick as a flash the knife shot up and back, almost catching my fingers. But this hurting one's-self is not all. Suppose the team starts while the driver is out of his seat; if they run, they carry destruction with them, and it is all one's life is worth to try to stop them.

RASPBERRIES.

We are in a region where the thermometer occasionally gets to "forty below" and our raspberry list must include only the hardy kinds, such as Philadelphia, Davison's Thornless, McCormick, and Doolittle. For this market I should plant three-fourths of the first and one-eighth each of the next two.

Every family should have some of Fastolif and Brinckle's Orange, which can be bent down in the fall and pegged slightly, so as to be covered with snow, and then they will do well. The above are all that are worth cultivation here.

Brown Co., Wis.

NOTES FROM THE RURAL FARM.

We have to-day (Oct. 1) been preparing a small field for wheat on the after-culture plan. The ground after thorough plowing, harrowing, manuring and raking, was marked off eighteen by twelve inches. Three grains were planted (by hand, of course,) at the intersections, all but one plant of which will be removed later. This will make the plants one foot apart in the rows—the rows one foot and a half apart. Our object is to ascertain, at any cost of time and labor, *how much* wheat can be raised per acre by this system of culture. The amount of seed wheat thus planted was at the rate of four quarts per acre.

We have sown many varieties of winter wheat upon measured areas so as to test their relative values.

The earth is dry even at the bottom of the plow-furrows, and many for this reason are not able to prepare their land for wheat.

No frost yet.

Queens Co., L. I.

Industrial Societies.

PENNSYLVANIA STATE FAIR.

Erie, Pa., Sept. 28, 1878.

The point selected for the Fair cannot be called a good one, as it is not sufficiently central. In fact it is not central at all. It is said that the State Agricultural Society will combine with the Pittsburgh Association and hold the Fair in Pittsburgh next year. The plan includes making that city the permanent fair ground if, on trial, it is found a satisfactory arrangement. The attendance was good, running up to ten thousand on Wednesday, but bad weather on Thursday cut down the receipts. The total number of visitors was not as large as last year, which is to be regretted, as all departments were well filled, especially the live stock.

The cattle exhibited embraced Short-horns, Ayrshires, Holsteins, Devons, numerous Alderneys and grades. A. J. Wilson, Grafton, Ohio, D. D. Tracy, Erie, Walter Cole, Batavia, C. B. Moore, Christiana, and Chas. Lincoln, Lewisburgh, secured the herd prizes. There were forty-six entries of Short-horns, mainly represented by Messrs. Dunn, Lincoln and Jas. Miles of Miles' Grove. There were four exhibitors of Ayrshires, whose combined strength made the thirty-three entries in that class. D. D. Tracy practically monopolized the Holsteins, which were fine, especially the four-year-old bull Hector. Mr. W. Cole, whose Devons were a feature at Elmira, exhibited here also. The Jerseys comprised only thirteen entries, of which Mr. C. B Moore contributed nine. This gentleman also exhibited largely in swine, showing imported Berkshires and Yorkshires.

E. B. Aldridge was strong in Suffolks, Chester Whites and Essex pigs. Walter & Sons of West Chester might have been expected to have a strong representation of Chester Whites, and they did not disappoint expectation.

The sheep were so feebly represented as to compel an expression of regret from the judges.

There were only sixty coops of poultry, and no premium awarded exceeded two dollars.

The departments comprising implements, etc. were well-stocked by goods of the leading manufacturers. H. M. Reid & Co. of Erie, as manufacturers' agents, made the largest and most varied display on the grounds.

The Cortland Wagon and Watertown Wagon Companies, New York State concerns, were fully represented, as were the Dudley Tortion Spring Co. The Harrisburg Car Co., having turned their attention to agriculture, in a small way, showed several of the products of their shops. A new Adjustable Harrow of novel design was shown by Levi Brown of Angola, N. Y.

A. L. Haskell, Lake Pleasant, Pa., exhibited the Haskell Sulky Hay Rake—the only successful sulky revolving rake made—it is the old revolving rake attached to wheels. This implement can be operated by a boy ten years old; it is well made and has been in successful operation (eight hundred being in use in Erie Co.) for the past ten years. Its weight is only 275 lbs.

John Dodds, Dayton, Ohio, took first premium on the Reindeer Self-dump Rake—this rake took the same premium at this fair last year and also a special award of merit at the New Jersey State Fair—in competition with most of the principal rakes.

The judges confessed to an inability to make discriminating awards to the implements, because of the general excellence of the display. Space forbids the mention of many names familiar to Rural readers.

The Apples, Grapes, Farm Products, Flowers, etc., were very good and the Domestic Economy departments were replete with the newest and most convenient appliances for advancing the comfort of the family. All departments "drew" well until about two o'clock each day, when there was a general stampede to the race track to witness "agricultural horse trots."

Your correspondent begs to thank Secretary D. W. Seiler, and Wm. Chandler, Supt. of live-stock, for courtesies rendered. K.

ILLINOIS STATE FAIR.

The Twenty-sixth Annual State Fair of Illinois opened at Freeport, in the northern part of the State, on the 16th Sept., under favorable auspices; as the day was bright and pleasant,

and the very large number of entries of live stock, agricultural machinery, and farm products of every kind, gave promise of a fine show and success in every respect. The attendance of visitors on Monday and Tuesday was not large, but, like the large drops that precede a heavy rainfall, those that came indicated the great outpouring of people that would follow during the rest of the week if the weather would only please be good!

Wednesday, 18th, was the grand gala-day. The weather was propitious and everybody was happy. From country and city, and seemingly from *everywhere* the people came pouring in, and then distributed themselves all over the grounds, with eager eyes and ears open, to see and hear whatever was to be seen and heard.

The biennial election of members of the State Board of Agriculture was held in the afternoon of the 18th. Each county is entitled to three delegates, and the representation was very creditable. As the new Board has the power of locating the State Fair for the next two years—the duration of their office—considerable interest was manifested. The officers consist of a President, ex-President, Secretary, Treasurer, and one Vice-President from each district. The delegates elect the President and Vice-Presidents, at their first meeting in January ensuing, choose a Secretary and Treasurer, and the retiring President is designated as ex-President. The election on Wednesday resulted as follows: President, James R. Scott, of Champaign, *vice* D. B. Gillham, of Upper Alton, who now becomes ex-President. Secretary S. D. Fisher, of Springfield, and Treasurer J. W. Bunn, of Springfield, will continue in office until the new Board meets, on the first Tuesday of January next, when they will most likely be re-elected.

Chicago, a somewhat noted "Village by the Lake," modestly asked for the Fair for the next two years or longer, and will probably get it, as there is no "getting around Chicago" in Illinois. That city now has a great Exhibition in full blast, and from the second to the seventh of next December promises one of the fattest of fat-stock shows that have ever been attempted, and yet she isn't happy unless she gets the State Fair in the near future!

On Thursday, 19th, immense numbers came flocking in from every quarter; but the weather was threatening, and at one o'clock, P. M., a heavy rain and wind storm set in, which lasted for about an hour, and did much damage. Tents were blown down, many got drenched, and the fair prospects of the Fair, for the rest of the week, were completely spoiled. Thus, the happy beginning had a sorry ending. After the storm the weather was tolerably good, but the air was so chilly and disagreeable on Friday that the visitors were few and the interest flagged. Exhibitors commenced removing their goods on Friday evening, and by Saturday evening the great Fair was closed out. It was a success in the large number and fine quality of its exhibits; but the gate receipts amounted to only $10,000, which fell short of paying all expenses, premiums, etc. Had it not been for the storm coming just at the high tide of success, and when the people were becoming deeply interested, there would have been no failure in any particular. W. B. DERRICK.

Ogle Co., Ill.

TOLLAND CO., (CONN.) FAIR.

THE twenty-sixth annual exhibition of the Tolland Co., Agricultural Society was held at Hyde Park, near Rockville on the 25th and 26th days of September. The first day was devoted to the exhibition of cattle and called out some of the best animals owned in the county. The principal breeds exhibited were Devon and Jersey, although there was a good sprinkling of other breeds. Grade and native stock of good appearance was present in large numbers. The chief—and a very fine one too—exhibition of Devon stock was by Hon. E. H. HYDE of Stafford, who turned out with a herd of handsome animals. In the line of Jerseys, N. B. and Leroy G. Perkins, of Mansfield, were considerable exhibitors, as was also Normal L. Babcock of South Coventry. C. H. Owen of Manchester also put in a good collection of animals in the same class.

The Jersey breeders are not as old in the business as Gov. Hyde, having commenced recently; but they have been happily successful. In this county there are probably more milch cows of the Jersey blood than of any other. The improvement in neat stock within a comparatively short period of time, has been very marked and very much is due to the influence exerted by those men who have labored for the production of the most approved animals.

The show of sheep and swine was very limited. That this should be so in the case of sheep is easily accounted for by the fact that the alarming increase in the number of dogs in the State and especially in this county, has very nearly exterminated the sheep; but in view of a marked improvement in the breeding of hogs, and of the fact that Berkshires, and Poland Chinas are common, it is a mystery why so few choice specimens of swine were put upon exhibition. There was an unusually full display of poultry, as many farmers are turning their attention to the more extensive raising of poultry both for chicks and eggs as a source of profit. The chief exhibitors were W. H. Hott of Willington and Norman B. Perkins of Mansfield.

As might have been expected, the show of fruit was magnificent, not only on account of the number of specimens, but also because of their size and the beauty of their coloring. In apples, Samuel F. West of Columbia led off, having fifty-one varieties. He was followed by Mrs. Porter Walbridge of Tolland with twenty-nine, E. H. Lathrop of Vernon with twenty-five, Gov. H. Goodwin of Burnside with twenty-one, while the exhibits of many others though smaller in number were of very fine quality. C. H. Owen of Manchester and H. Nash of Ellington each had fine collections of pears. Some of the most luscious peaches that I have seen for many a day were brought in by Judge G. W. West of Rockville. There was an unusually large display of this fruit, the largest number of varieties being presented by E. S. Henry of Rockville, who also exhibited some beautiful specimens of the Kittatinny blackberries. The exhibition of vegetables was much below that of former years, both in the number of exhibits and in the size and general appearance of specimens. A very noticeable feature was an exhibit of grains of all kinds from Nebraska, which were very fine and served an excellent purpose in advertising the cereal capacity of Nebraska soils. The ladies were prompt in furnishing specimens of butter, cheese, bread honey, canned fruits, dried apples, etc., besides many specimens of useful and ornamental handiwork.

There was a good show of horses, perhaps too good, as the second day was largely devoted to trotting, which does not seem particularly advantageous to agricultural fairs or promotive of the interests of the farmer. Another objectionable feature, common also at other farmers' exhibitions, was the petty gambling allowed by the managers of the ground, to tempt the unwary and the young. If everything of this kind could be abolished from fair grounds, so that young people, (and older ones too) could come without the danger of being drawn into immoral practices, the attendance at fairs would be greatly increased. The receipts were unexpectedly small, owing chiefly to unpleasant weather at the opening of the second day.

W. H. YEOMANS.

Everywhere.

RURAL SPECIAL REPORTS.

WAUKESHA Co., Wis., Sept. 23.

How to class the changes of weather between early spring and the present time would be no easy task. Spring opened early—we sowed spring wheat between the 18th and the end of March, and oats and barley from the 1st to the 8th of April. During the whole of the sowing time the weather was changeable, as may be seen from the following memoranda: March 18, 19, 20, very fine; 21, rain; 22, pleasant; 23, warm in the morning, changing to a severe cold later in the day; 24, 25, 26, severe cold; 27, rain; 28, dry and cold, but pleasant; 29, sharp freezing night with a pleasant day; 30, cloudy with occasional showers; 31, fine.

April opened with fine days which lasted during the greater part of the month. May was a favorable month for farm work—corn and potatoes were all planted in fine condition. June opened with heavy rains washing the corn ground badly. July entered very warm—the corn fairly jumped and continued so to do until the middle of the month when the extremely hot weather and the drought put upon it a check which it never recovered from; consequently it did not fill out and we have only about half a crop. Potatoes suffered badly from the same cause, so that our early potatoes are like marbles, yielding about 20 bushels to the acre. The drought continued until Thursday, the 19th of Sept., when rain set in, continuing down to the present time, thoroughly saturating the ground and making it too wet for working on it.

The wheat crop in this section was good. I thrashed 404 bushels, of the Clawson variety of winter wheat from 12 acres. My Russian Fife yielded 18 bushels per acre; Scotch Fife, about 12 bushels; oats 45 bushels. I sold my wheat and barley for one dollar per bushel. Rye yielded 28 bushels per acre, and is worth 45 cents per bushel. No. 2 wheat is now worth 82 cents per bushel in Oconomowoc, our nearest market, situated 30 miles west of Milwaukee, on the Chicago, St. Paul & Milwaukee R. R. Our hay crop was good. We have a fine breed of hogs, both white and black, worth about $3.00 per cwt.

We enjoy a very healthy climate. Our soil is well adapted for wheat. We feel indebted to the RURAL for its many hints on the best methods of fertilizing our land. Our town owes much of its thrift to those timely hints. Our verdant fields—despite the drought—speak volumes of thanks to the writer on clover and its value as a ferilizer. Our sleek cattle and sheep send a friendly greeting to their generous benefactor. I endorse heartily the article on clover; it possesses the qualities of enriching and loosening heavy land; it also produces an excellent hay for sheep and cattle, and will keep green when other grasses are dried up. It should be sown as early in the spring as possible in order to enable it to root deep before fall.

H. F. S.

VAN BUREN, Crawford Co., Ark., Sept. 22.

OUR most strange and remarkable summer has passed and, instead of almost daily rains of from one to two hours' duration, each shower followed by clear skies, blazing heat and steam hot enough to almost scald exposed animals, man included, we now have clear, cool and pleasant autumn weather. The thermometer registers about 50° at sunrise; maximum, 75°.

The fruit crop is almost a total failure. Peaches and apples have all, or very nearly all, been destroyed by either the canker-worm or the curculio. It is almost impossible to find a single specimen unaffected by these depredators. Nothing of the kind ever occurred in this country before. In all the valley lands the fruit crop, except a few very early varieties of peaches, apples, apricots, pears, &c., have rotted in mass. On the high, rolling Ozark Mountains, nothing of the kind has occured and there fruit of all kinds has been and is very fine. Pear trees have blighted badly throughout the valley of the Arkansas River. The disease has affected many varieties never before touched by it. The Seckel, Duchesse d'Angouleme and others which up to this year have been supposed to be exempt from the disease, have, in places, blighted badly. R. T.

SOUTHERN MINNESOTA, Sept. 30.

THE past year has been a remarkable one in this country. We plowed till the first of January. There was but very little frost in the ground, and we had no snow to speak of through the winter, something unprecedented since the first settlement of the country. The prospect of the wheat crop—the great crop of this country—never was so flattering as in the early part of the season. It bade fair to far excel the great crop of forty million bushels in 1877, up to within a short time before harvest, when the weather became excessively hot and wet, which seemed to ripen the grain up suddenly and prematurely. A great deal was not cut at all. What was harvested yields, when thrashed, much better than was expected, often twenty bushels or more per acre, but it is light in weight. That which was sowed very early—and a good deal was sowed in February—is much the best. In the northern part of the State, wheat is very good, and, as it is, Minnesota has a big surplus, though most of it is of poor quality. The wet weather spoiled a great deal of hay. Since then, till the past week or two, it has been dry—excellent weather for stacking and thrashing. Oats, a good crop; never before so cheap—18 and 20 cents per bushel. Corn, the best ever raised here. We grow the Ohio Dent exclusively. D. B. E.

CHATHAM Co., Ga., Sep. 28.

WE have the best section of the United States for a poor man. If some of the New England small farmers would settle here, in Southern Georgia, where lands are cheap and the climate perfectly healthy, and where they could combine truck or market gardening for the early Northern markets with the cultivation of cotton, rice, and tobacco, there is no doubt but that they would succeed and soon grow rich. Several Northern men, however, came here immediately after the war and lost all they had brought; but it was clearly their own fault. They thought they knew all about the cultivation of cotton, and they would neither ask nor take advice with regard to it, from the natives. This was a sad mistake, for there are many points a Northern man must learn before he can successfully raise cotton and other strictly Southern crops. But if they come here and start in the pine belt close to a railroad, planting the crops they are accustomed to, such as wheat, oats, rye, Irish potatoes—of which they can make a spring and fall crop on the same land—watermelons, pears and peaches for market, their superior skill and energy will undoubtedly win them an ample reward, and then after a while they can plant cotton successfully. CHAS. COLLINS.

LINCOLN, Logan Co., Ill., Sept. 30, 1878.

IT is very dry and has been so for two months or more; true, we get a little rain now and then, but not enough for grass or stock. Our pastures are very short; but stock eat hay readily. Corn is a light crop about here, on account of the dry weather. Wheat was a good crop. Some raise Mediterranean, others different kinds of smooth-headed wheat. There has been a large area of wheat sown this fall, the rains have helped the young growth and it looks well. Some slack farmers have not finished sowing, and, as a matter of course, such men don't get good crops. Our hay crop was good. The Acme tomato was the best of several varieties grown on my grounds.

WARREN Co., N. C., Sept. 29th, 1878.

WITH regard to Raspberries, there is not enough of them planted hereabouts to enable one to give an opinion as to the best varieties. I am told there are no plantations of any importance south of Washington, D. C. The few beds I have seen in bearing were some variety of Black-cap, and gave fair crops of fruit. Raspberries grow wild here, to some extent, especially a straw-colored variety. I see no reason why they should not be as profitably grown in this State as any other kind of fruit. M. B. P.

HOUSTON, Texas, Sept. 10.

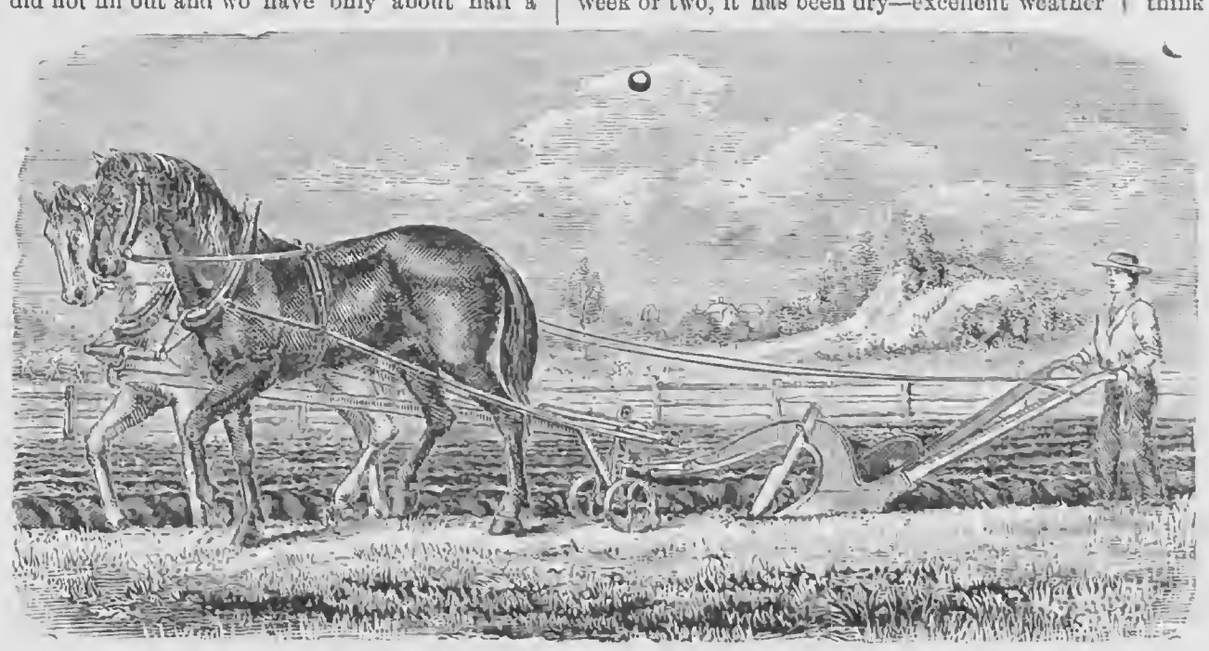
COTTON is fast arriving from the interior of the State; there is every where complaint about want of hands for picking. The weather continues showery, alternating with piercing glances of the sun. Health in general is excellent; no visits from Yellow-Jack as yet. The State is vigilantly guarded against the introduction of this most unwelcome guest. G. M.

MR. LOVETT writes us that the floral exhibit of the N. J. H. Society to be held at Mt. Holly, promises to be not only a success but something grand.

Industrial Implements.

HARRIS' FARM TRUCK.

THIS is a new invention, the outcome of the experience of Mr. Milo Harris, who, previous to making arrangements for its general introduction, has had it thoroughly tested by his neighboring farmers. By the courtesy of the manufacturers, Messrs. Saxton & Amidon, Buffalo, N. Y., we have had an opportunity to test the truck on the RURAL Experimental Farm, and we think so well of it that we take occasion, in this issue, to present an illustration of the truck to our readers, showing its method of working before the plow. This truck is simply constructed, being nothing more than a pole braced to an iron upright that rests on an axle of the same material. The upright is pierced with holes along almost its entire length, through which are fastened, at appropriate hights, whatever implement it is desired to use.



HARRIS' FARM TRUCK.

We had no idea, until using it, that so simple an attachment could be made such a valuable adjunct on the farm. Its various uses lead us to heartily recommend it to farmers as something that cannot be dispensed with to advantage. It is especially valuable before the plow, doing away with the necessity for a gauge wheel, lessening the labor of holding and steadying the tool, which it keeps well down to its work, obviating beam-riding. Not only in plowing, but in dragging the harrow, cultivator, road-scraper, horse-fork and, in short, in almost any operation that calls for the services of the team, the truck "works like a charm." There is nodragging of the whiffletrees or entangling of the horses' legs in the traces. The team pulls more steadily and does a greater amount of work with less strain. The horses are much more easily handled and, in short, it is the most generally useful implement about the farm. Its low price puts it within the reach of moderate purses.

TABLE OF CONTENTS.

PRACTICAL DEPARTMENTS:

Lady Carew, 3d—(Illustrated)..... 645
Montclair Raspberry—(Illustrated)..... 645
Montclair and other Raspberries—J. C. Williams. 645
Herstine—(Illustrated)..... 646

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY OCT. 12, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

WHAT IS THE MATTER?

THERE is a reason for everything, and there is doubtless a reason why more than 500,000 (it looks more formidable in figures) working men are unable to procure work, and at the same time so much money is lying idle in the banks that it is loaned out at the rate of one or two percent. per annum. Why cannot these laborers, and this idle capital, which is the mainspring of the machinery by which labor is made active and profitable, be brought together? What hinders it? This seems to be a question which no one can solve, for of all the attempted solutions offered, not one finds that general acceptance which would at once be given to a plain truth. The trouble seems to be based more upon a general restlessness and dissatisfaction amongst the working people themselves, than upon any actual condition of things which could account for it. Strikes and threatened strikes and murmurings deep if not loud, exist on every hand. The present low compensation for labor, and the hours of labor—which, in fact, are really the same thing as the question of wages—on the one hand, and the absence of profit or of a certainty of profit from the use of the labor by the employment of capital at any higher rate, on the other hand, seem to keep the two elements of social prosperity apart.

It is certain that working people are dissatisfied with the present scale of wages; and equally certain that those who have money to use in supplying labor, fear to embark in any enterprise, lest as soon as they begin they may be met with demands they cannot satisfy. And so they hold aloof. Half a million working people represent, perhaps, a sixteenth part of the whole population. With sixteen per cent of the nation idle, and unable to purchase the necessaries of life, a large inroad is made upon the condition of all the remainder; and the purchasing and consumptive, as well as the employing power of these, is seriously curtailed. Consumption being reduced, production of course must be decreased in proportion, and prices fall with it. Thus our present condition seems to be far from unaccountable, if we take into consideration the large unstable and dissatisfied element which has appeared among the working classes. It seems that the prevalent uncertainty of what may happen is the principal cause of our trouble, rather than any real adverse condition of things. The misfortnue at the bottom of it all may be that there is much ignorance and unreason existing among the laboring people, which is inflamed by self-seeking agitators who turn a popular misunderstanding into a general grievance, causing bitter feelings, and false hopes of something better to arise from changes, that would effectually destroy any possibility of escape from the present difficulty. An employer cannot fix, permanently, the rate of wages; if he could, why was it that during the war laborers were paid two-and-a-half or three dollars per day, and the wages gradually increased up to that point without strikes or demands on the part of the laborers. Farmers could as easily fix the price of their produce. But this they cannot do. They take what they can get, and are fain to be content; although they may grumble about it. If only a similar disposition were exhibited by working men, and patience be exercised under adversity of business, confidence would be restored; and with that the wheels would hum, and business be active once more.

RESPONSIBILITY FOR ADVERTISEMENTS.

NEVER in the history of the RURAL NEW-YORKER has there been, in the judgment of its present proprietors, so much care bestowed on the exclusion from its columns of all advertisements of articles which are not in reality what they are represented to be. We hold ourselves just as much responsible for a truthful presentation of what appears in our advertising columns as we do for the general accuracy of the matter published in the rest of the paper. Just as we are always ready to correct mistakes or controvert erroneous statements inadvertently admitted into other departments of the RURAL, so we are always ready to reject any advertisements just as soon as we may learn that they are calculated to mislead or defraud our readers. While a trustworthy advertising department is a desirable feature in any journal, it is especially important in a rural paper, because its readers have fewer facilities than city folks for examining personally the articles they may feel inclined to purchase, and are therefore disposed or forced to place more reliance on the representations made in advertisements. In our opinion they have a right to expect that the conductors of the papers which solicit their patronage should see to it that these papers should not be made the vehicles for fraud upon them or misrepresentation. In full view of this opinion, if we admitted advertisements which we knew to be deceptive, we should consider ourselves guilty of being voluntarily instrumental in *defrauding our own friends*. Despite our scrutiny, however, it may happen that a false representation of an article may rarely find its way into our columns, and, in such an event, we would thank any of our readers who would notify us promptly on discovering the cheat. A trustworthy advertising department is a twofold benefit—a benefit to the intending purchaser who can confidently rely on the genuineness of the articles advertised, and a benefit to the honest advertiser, because the very fact of his advertisement having been inserted is a fair evidence of the excellence of the article thus brought to the notice of the public.

INSUFFICIENT PROOFS.

If we apply protection to rose-bushes, to grape-vines, to the wheat field; and the bush, vine or wheat survive the winter, we give credit to the "protection" for saving the plant. If we manure our corn with bone and a fine crop ensue, the bone did it. If we cut potatoes to single eyes and a larger crop than usual follow, it was because we cut the "seed" to single eyes. If we scrape the "trunks" of our apple trees this fall and a better crop than usual be harvested next season, it is because the "trunks" were scraped. How prone are we to attribute any improvement in our crops to whatever we happen to do to them a little out of the usual way! How do we know the protection saved the bush, vine or wheat? Were there others beside them *not* protected—and did they die? How do we know the bone benefited our corn? Was there beside it an unmanured plot that did not yield half so much? Did we plant whole or half potatoes beside those cut to single eyes, and did they not yield as well? How do we know that scraping the bark increased the crop of fruit? Were there other trees not scraped of the same age, growing under precisely the same conditions, that did not do half as well?

Probably we made none of these comparative tests, but we write out our "experience" as if we had done so, and, after consciously or unconsciously coloring our account a little for the good of the public, the statement appears in print, and, if told in a "taking" way, the story goes "the rounds." Thus it is that errors are propagated and the "truth about it" is hard to find out.

Covered Yards.—Few farmers in America have yet considered the value and use of a covered cattle yard. In England such are not uncommon, and they are coming daily more into use, both there and upon the Continent. In this country, where building material, especially wood, is more abundant and cheaper, we feel convinced that their adoption would, in many cases, be found to pay. Properly constructed, they protect the cattle from the inclement weather, and allow of their being turned out many more days in the year than would be otherwise prudent. They also make the yard more comfortable and cleanly for the cattle to lie down; and they protect the manure from leaching or washing by rains. In this way alone a roof would often pay a good percentage on its cost. If to the roof we add also a pavement, with a covered cistern in the center, into which all surplus moisture is conducted, we shall then have completed one of the most valuable improvements that a dairy or stock farm can possess.

Horns.—High breeding of neat stock is almost universally accompanied by a decrease in the size and strength of the horns. In the Short-horn and Jersey breeds they have become very insignificant, and might easily be made to disappear by taking a cross from one of the polled breeds most nearly allied in desirable qualities to each. We believe that an effort in this direction will pay, and pay well. It would be far better if these offensive weapons were made to disappear, now that our cattle no longer need them as a protection against wild beasts. For want of such legitimate use they are too often turned into instruments of mutual annoyance and injury by the more vigorous members of a herd. We have no doubt that a "tunk" in the flank from the horn of another cow is more often the cause of abortion than many think.

Cheap Bone-Dust.—Nearly every farmer has surplus apples, or some other fruit, that the boys of the neighborhood, and especially of the neighboring village, long for. Tell them you will give them a peck of apples for a bushel of bones, and you will have plenty of customers. Then, late in the fall, take a little waste wood, pile it with the bones in a heap, and burn them until they are white and can be pulverized with the back of a shovel. This gives you what is called bone-ash, a powerful fertilizer, and just what is wanted as an ingredient of the compost heap. It is the cheapest way both to get and utilize the waste bones, thousands of bushels of which lie around in every community.

BREVITIES.

THE Hornet is not to be trusted.

MUCK is excellent for Raspberries.

DELAWARE is fond of the Brandywine.

THE only shares that yield a certain dividend—plow-shares.

A good raspberry plantation should yield sixty bushels per acre.

THE more you cut it, the better it likes it—Couch-grass, Triticum repens.

THE Western Triumph Blackberry is a favorite in Indiana. It is useless with us.

A PLANTATION of Raspberries should be renewed, as a rule, every five years.

THE best way to exterminate rats is, like weeds, to prevent their germination.

CARROTS or potatoes may be grown between the rows of Raspberries for the first year.

WE may call this our Raspberry and Blackberry number for 1878. We hope to live to give another about this time in 1879, and to be able to tell that many varieties (of Raspberries at least) now under test, are improvements upon the well-known sorts.

SECRETARIES of fairs over the country will accept our best thanks for their invitations to attend.

THE Beauty of Hebron potato took the first premium at the Fair of the Fairfield Co., N. J., Ag'l Society.

THE safest way for this climate, with all the foreign sorts of Raspberries or their seedlings, is to bend down the canes and cover them with earth.

MR. E. P. ROE says: One of the evils of the day is the extravagant praise or sweeping censure of the various fruits before the public at the present time.

RASPBERRIES are easily raised from seed. Wash the pulp from the seed and preserve in rather damp sand. Sow half an inch deep in fine soil. They will begin to bear in two or three years.

THACKERAY advises the choosing of disagreeable friends. "Though it is a hard and cruel thing to say, I would urge you to beware of taking pleasant fellows for your friends. Choose a good, disagreeable friend, if you are wise,—a surly, steady, economical, rigid fellow."

SPEAKING of *hardy* Raspberries, there is really no such thing. Some will endure cold, some heat, some drought. But there is not one that will stand all. Hence it is that in some years what we believe to be the hardiest varieties are harmed or even cut down to the ground.

A FRIEND of ours wrote to another friend living in a "malarial neighborhood:" "I hope you are all over the painful effects of drawing in poison with every breath and that you have resolved to move before you have to be moved." We repeat this advice to those similarly situated.

WHO was it that asked, "Ought not the people who say they cannot afford the time and money required to supply their tables with small fruits, and in consequence pay ten times the amount in doctors' bills, to be placed in lunatic asylums?" Pray tell us who said that. There is something in it we believe.

A FRIEND sends us from Lawrence, Kansas, a head of Pearl Millet as a sample of what Kansas can do in that line. He gathered over a bushel of well ripened heads from a row about two rods long. The specimen received by us measures seventeen and a quarter inches in length and three and a half in circumference.

IT should always be borne in mind that it is only that part of the soil that can be dissolved by water that is available as plant food. The soil may contain an abundance of plant food, but if it is not ready for use, it might as well not be there. Plants can not live on promise and the future fertility of the soil is naught to them. When they want their dinners the dinners should be ready.

WE agree with a well-known gentleman who is also, rather strangely a minister, a novelist and a small-fruit culturist, when he says: "If the men are incorrigible" (about small-fruit culture) "let the ladies of the household take the matter in hand. A tithe of the attention bestowed upon their bonnets would enable them to master the science of small-fruit raising for all practical purposes." But the trouble seems to be with many ladies that they think more of that "tithe" than they do of small fruits!

EXTRAORDINARY LONGEVITY.—The list of deaths published in the Hartford (Ct) Weekly Courant, Sept. 19, 1878, shows an average longevity greater, we presume, than that of any other ordinary death record ever printed. The aggregate amount of the ages of the forty persons, whose deaths are there recorded, is 2,701 years—the average being over 67 years. The youngest was 21, and the oldest "more than 100."—Classified, we find those whose ages were between 20 and 30, 3; 30 and 40, 7; 40 and 50, 2; 50 and 60, 3; 60 and 70, 1; 70 and 80, 6; 80 and 90, 10; 90 and 100, 7; "more than 100," 1. This last was an old negro man, supposed to be 105 or 106 years old.

THE proposition that an abundance in the supply of one portion of the food for plants does not compensate for a short supply of another equally important portion of the food, is aptly illustrated by Mr. Tanner. "A builder," he says, "may have plenty of stone for the construction he intends to erect, but if he has little mortar his progress is soon stopped for want of a further supply. It would not assist him if he increased his supply of stone. He wants something else, and unless this is ready for his use, he can make no progress." It is the supply of plant-food, which exists in the smallest quantity, that determines the crop. If, therefore, your soil wants potash, all the "phosphates" in the land are not going to add a head of wheat.

IT is well for all to know that most of the cultivated Raspberries are derived from three species. Rubus Idæus, is the European garden Raspberry. The stems are tall and erect, and the prickles straight and slender. This species increases by suckers. Brinckle's Orange, Clarke, Franconia, etc., are examples. The Black-cap varieties, like Davison's Thornless, Catawissa, Mammoth Cluster, etc., have recurving stems, the tips of which take root in the ground. These are from Rubus occidentalis, the wild black Raspberry. The stems are armed with hooked prickles. The Philadelphia, Brandywine, Kirtland, Herstine etc., are varieties of Rubus strigosus, the wild red Raspberry. This has upright stems, which are beset with bristles. The canes are increased by suckers.

YOU who have trees, shrubs, Lilies, Tulips Hyacinths to buy this fall—buy them now and plant them—the sooner the better. Pelargoniums (Geraniums) will stand light frosts without any serious harm. If cuttings were made and rooted a month or two ago, the old plants might better be given away to appreciative neighbors who cannot afford to buy them. Dahlias, Tube-roses, Gladioli, etc., may now be taken up, dried and stored away—a dry, frost-proof cellar for the first; a warm place for the second, and a cool, dry room for the last. Remove the bulblets from the Gladioli bulbs or corms, and place them in thin muslin bags. To those who have more plants than they have room for, we would say: Dig a square hole in well-drained ground six or seven feet deep. Line the sides with hemlock boards, and put the plants in this. They will winter nicely. Sashes will be needed, of course, to cover the top, upon which mats or carpets may be thrown in very cold weather.

Literary Miscellany.

"THE STROLLING PLAYERS."

E. STUART PHELPS.

Running away from mother,
Bareheaded up the street,
Kicking the dust into yellow smoke
With little roguish feet.

Tossing it over his clean white dress,
Into his stocking heels,
Choking the little wooden horse
That trundles along on wheels;

Dreaming away with wide blue eyes,
And speculating why
God won't give him the golden ball
That drops in the quivering sky.

What's the use of that pretty pink cloud,
Sailing away so high,
If you can't have a ride in it,
And it's just no use to try!

If that woman grew with glasses on;
If this house is papa's:
Why that nice red cow won't talk to him,
Looking across the bars.

Into the neighbors' gates and doors!
Under the cherry trees!
Into mischief and out again,
Whenever he may please;

Wandering at last to the old church steps,
Little horse and all;
Climbing up laboriously—
Too bad if he should fall!

Pushing in, with dimpled hands,
The great door strong and tall,
Letting the sweet warm summer light
Slide down the shadowed wall;

Standing there in the solemn hush
Of chancel, nave and dome;
Thinking it is prettier
Than the sitting-room at home;

Standing still in the broken lights
That shimmer through the place,
Mellowing down through painted glass
Like rainbows on his face.

Not a bit afraid—ah, no, indeed!
Of the shadows vast and dim;
Quite at home! and sure it was made
All on purpose for him!

* * * * *

The old, old words come up to me,
Spoken so long ago,
About the heavenly temple
Where you and I would go—

The beautiful waiting temple
Which has no room for sin;
Something about a little child,
And the way of entering in. [*Alliance.*

HOW TO PREPARE DRIED GRASSES FOR ROOM DECORATION.

JULIUS J. HEINRICH.

FIRST PAPER.

Those readers of the Rural who may desire to decorate parlor or sitting-room mantels, or picture-frames with dried grasses, ferns, flowers, autumn leaves, etc., will find the following suggestions very useful, as they are the result of many years of experience.

The varieties of grasses found in the Northern States are not as plentiful as those that can be gathered farther south; those collected here will be mostly composed of Red Top Grass (Agrostis vulgaris), Creeping Bent Grass (Agrostis stolonifera), Kentucky Blue Grass (Poa pratensis), Wood Meadow Grass (Poa nemoralis), Hungarian Grass (Panicum Germanicum), Tall Meadow Grass (Avena elatior), Yellow Oat Grass (Avena flavescens), Orchard Grass (Dactylis glomerata), and Timothy or Herd Grass (Phleum pratense.) There are a few more, but these are the principal ones.

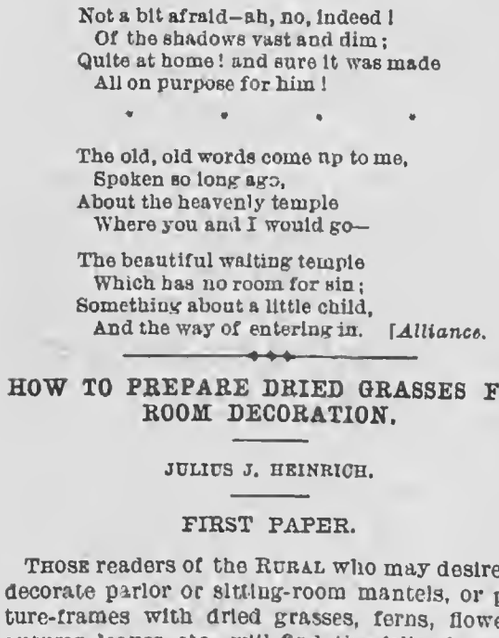

Fig. 1.

In gathering them, select such as are in full bloom but not ripe with seed; spread them on a paper in the shade to dry, and when thoroughly dry they will be ready for dyeing, if it is not desirable to use them in their natural state.

Those wishing to dye them in any bright color, will have to dip them five or six times in boiling, hot water, spread them thinly on paper in the sun and let them get thoroughly dry; when dry, repeat the dipping in hot water and place them in the sun again; this must be repeated until they become bleached, or of a yellowish-white color, when they are ready for the dye. Do not allow them to lie out of doors over night; either take them in or cover them up.

As it would take up too much space to give here full directions for coloring or dyeing and as some of the ingredients are not easily obtained, I will give any reador of the Rural who may desire it full particulars if they will address me at P. O. Box 899, New York. It is close attention to these details which makes success possible in the matter of coloring, for one grain too much or too little will spoil the effect.

In gathering ferns, do not select the largest, the smaller ones are much better. Press them between layers of blotting-paper for from six to eight days, when they will be ready for use.

Fig. 2.

Fig. 3.

Autumn leaves if too dry when you are ready to wax and varnish them, can be softened by soaking them an hour in water, then covering them with a thin coating of wax in the following way: Take a small flat-iron and warm it on the stove; run the iron over a piece of wax and then over the leaf until well covered; let this become dry, and give the leaf a thin coating of white copal varnish with a brush, and it will then be ready for use.

Fig. 4.

The flowers used for mixing with dried grasses and ferns are Acroclinium album and roseum, fig. 1, Ammobium alatum, fig. 2. Immortelles (Gnaphalium), fig. 3. Helichrysum compositum, fig. 4. Rhodanthe maculata, fig. 5. Xeranthemum and Statice incana, fig. 6. S. hybrida, fig. 7.

In arranging domestic grasses, it is advisable to use some of the imported grasses with them, such as Agrostis pulcella, fig 8; Bromus brizæformis fig. 9; Lagurus ovatus, fig 10. and Stipa pennata or Feather Grass, fig. 11. also some of the grasses gathered in the Southern States, such as Sea Oats fig. 12. Plume Grass and also the California Pampas Plumes.

Fig. 5.

Designs showing how to arrange grasses will be given in the Rural of Oct. 19. Messrs. August Rolker & Sons, N. Y., have kindly loaned the cuts used in this article.

THE DISCARDED DAUGHTER.

IN FOUR CHAPTERS.

BY ELLEN HUNTER.

CHAPTER I.

Over the scrags and the long, black, desolate beach the wind and rain went driving pitilessly. It had stormed all day,—it was storming still at nightfall, harder, fiercer than ever.

Down in that little fishing hamlet, nestling close to the lonely shore, a few lights were shining in the cottage windows, and the red, lurid eye of the lighthouse glared ominously across the bar. It was a dreary night, and a dreary coast.

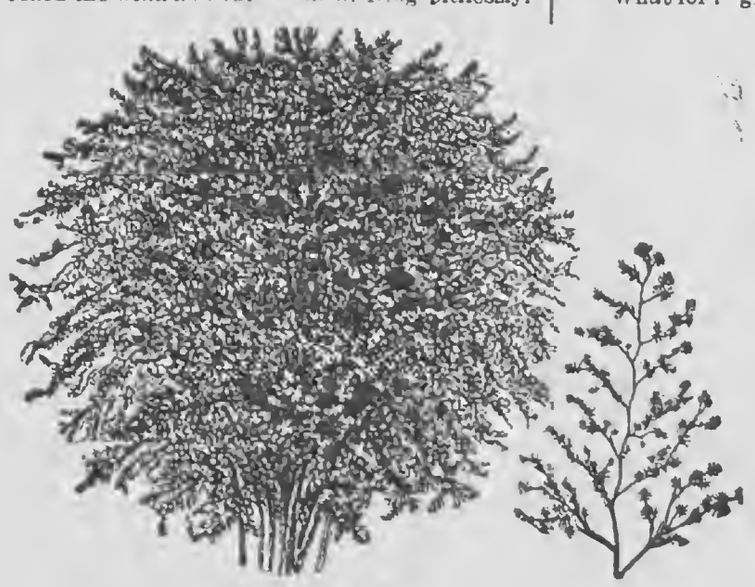

Fig. 7.

In that same fishing hamlet, old Hans Eckhart, sitting by a fire that leaped and roared up the wide chimney, in defiance of wind and rain, took his stumpy black pipe from his mouth, and looked about him, with a sort of dull surprise on his broad, brown face,

"Bless me! Hagar, do you hear it storm?"

"Yes, father."

She raised her head from the low window ledge where it had been resting, and the fire-light struck full upon her.

Hagar Eckhart was scarcely seventeen. It was a strange, beautiful face that the girl had. As she crouched there in the fierce firelight, with her head thrown back, and her small brown hands wreathed listlessly above it, you would have said it was a face for which another Mark Antony might fling a world away.

"If any ship goes to sailing up the Channel to-night, I pity 'um," said old Hans. "I've lived on this coast, man and boy, for fifty years, but I never heard it blow harder than this afore."

Fig. 6.

Hagar's dark, passionate eyes turned slowly from the cheerful coals back towards the night beyond the window. She shuddered; how black and thick it was! She could see nothing beyond the pane but the red beacon-fire of the light-house, and a few lamps in the low fishing village. Nothing? Yes; farther away towards the town, among clumps of dwarfed cedars and stunted pines, rose up the square, gray walls of Earnscliffe, and its broad casements were glaring

Fig. 9.

through the darkness, all ablaze with light. Earnscliffe was the gayest and the haughtiest house for miles and miles arounnd.

Old Hans laid down his pipe, looking the while at the still young figure in the window, and wondering what made her such an oddity.

"Hagar," he said, "where's Stephen gone?"

She did not turn her head.

"To the tavern, probably. I don't know,"

Old Hans cast a sober glance at the coals. Stephen was falling into bad ways; and his only boy, too,

The old-fashioned clock in the corner ticked loudly; the cat purred around Hagar's drooping hand; but still the royal face was pressed close against the dripping pane, the wide black eyes looked steadily out into the night.

"Hark!" said Hans, suddenly.

Some one was coming round the hut, whistling shrilly.

"That is Steve now," he said.

Hagar started back with a cry as the hard, sunburned face of Stephen Eckhart looked into her own from the other side of the pane. He flung up the window with a low laugh.

"Did I frighten you, Pussie?"

"Stephen!"

"Get the lantern, and come out here, will you, father?"

"What for?" growled Hans.

"If you're a mind to bear a hand"—began Stephen doggedly.

Hagar leaned forward and grasped his arm.

"Where are the men?"

Stephen placed his elbows on the window-ledge and looked indifferently in at the fire.

Fig. 8.

"Washed up out here. We've jest found 'em."

"Dead?" cried Hans, aghast.

"Dead as herrin's," said Steve, laconically.

The old fisherman came hurrying to the door, his tarpaulin crushed down over his brow, and with lantern in hand.

"A bad house—a bad race!" he muttered, under his teeth.

"The squire 'll take it kind of us to bring the bodies away," shouted Stephen. "Good heavens, how it blows!"

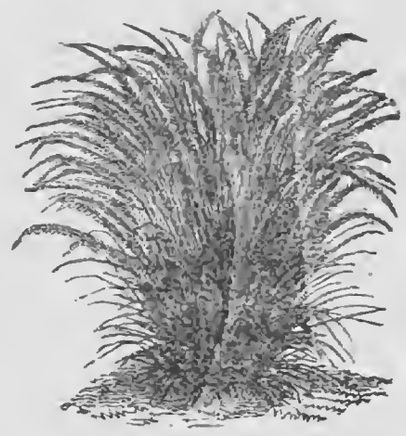

Fig. 11.

They went out through the darkness together; then the wind and rain came between, and silenced them.

Hagar stood alone in the hut.

The storm beat against the window. She pushed back her wet black hair, and strained her eyes to see the glimmer of the lights among the dwarfed pines. And why? She had never cared for Earnscliffe or its grandeur before. It was a gay, proud house—that she knew, and that only: The haughty old squire had passed her sometimes on the beach in his glittering carriage. Sometimes, of summer mornings, she had seen a pale, high-bred girl, with a score of gay ladies and gallants in attendance, gallop by the door, and old Hans had told her it was the squire's daughter, but that was all. There was a great gulf fixed between the fisherman's daughter and Earnscliffe.

Hark! A faint murmur of voices rose upon the wind. One stormy sweep of white rain across the window, on over the marshes: then a sudden lull, and Hagar heard them coming.

Fig. 10.

She stood in the low doorway shading the light with her hand, its red blaze showing full in her eyes and slipping down her damp, wild hair. First, the hale, hearty face of old Hans; then Stephen.

They came in, and she closed the door behind them, keeping her glance fixedly away from the burden they bore.

It was the body of a man, with wet garments, rich and fine, clinging to him. They laid him down on the old fisherman's bed, in the firelight.

"He's got a breath of life in him, he has," said Hans, crossing his arms behind him, and gazing at the still white face; "but the other chap was a goner."

Stephen lifted up the handsome, drooping head.

"There's wine in the closet; bring it, Hagar."

She obeyed, silent and pale.

"Now, chafe the hands, can't you?"

What handsome hands they were! how much whiter than her own! There was a broad diamond signet-ring on the left one that was worth a prince's ransom! Regular, high-bred with loose, gold-brown curls falling over the white forehead, and an aristocratic clearness and finish of outline. She dropped the hands with the first current of warmth that thrilled them.

"It's the same gentleman that was riding on the beach with Miss Earnscliffe yesterday," said Stephen.

Fig. 12

Stephen shook himself like a great water dog.

"That yacht that pushed off from Shipping Point a half hour ago with some young fellows from Earnscliffe aboard, has struck on the rocks and gone down."

"Bless me!" cried Hans.

Old Hans jogged his elbow. The stranger's eyes were unclosing slowly.

He looked around. First at the brown, unfamiliar wall, at the ruddy fire, at the two kindly fishermen, and from thence to the face of Hagar. Their eyes met; it was a strange, fateful look. Hagar sank back slowly. John Romaine's eyes followed her face with a mixture of bewildered pleasure and surprise.

"Where am I?" he said, feebly.

"With friends," answered old Hans cheerily.

He raised himself up, and pressed his hand to his forehead in a bewildered way.

"And the yacht?"

"It's gone under, sir."

Romaine sank back, remembering then.

"Poor fellows!" he said faintly.

"We laid their bodies in the boat-house," said old Hans. "Steve shall go to Earnscliffe and tell the squire. Here's a drop of wine for you, sir."

Rough hearts, but kind ones. An hour after, and John Romaine was leaning back in his chair before the old fisherman's fire, idly talking with Hans of the disaster, and glancing admiringly at the still, slender figure which sat apart in the shadow, with her gorgeous Southern face bowed listlessly on her hand. Did he guess that she was a listener to every word that fell from his lips? It was a brief story, related politely, graciously, yet with something in the young aristocrat's manner that showed how unused he was to such an audience and such surroundings. He was a guest at Earnscliffe. The men who had perished with the yacht were the squire's servants, and the pushing out of the frail craft from Shipping Point in the night-storm had been a freak of desperate boldness—that was all.

And the still figure in the shadow? With her burning cheek pressed to the pane, and the dark eyes watching one pale, watery star just broken out from the windy clouds, she sat listening to the voice that was the deepest and the sweetest she had ever heard from mortal lips. No one spoke to her, no one heeded her, except, perhaps, Romaine: and presently he arose to say "good-night." She heard him, but did not turn her head.

"What shall I call you?" he said, beside her chair.

"Hagar Eckhart."

He looked down at her with puzzled blue eyes.

"Then, good-night, Miss Hagar."

"Good-night."

The storm passed. With the morning there was sunshine, and wide streaks of blue sky tangled in with the gray clouds overhead, and the wind blew strong and steady from the west.

John Romaine astonished himself by rising in time to see from the window of his low room the fierce, crimson daybreak stream over the lighthouse on the Point, and the high gray walls of Earnscliffe proudly and sullenly facing the sea. He shrugged his broad, handsome shoulders.

"I wonder if Miss Edith has thought of me since yesterday. Whew! what a night it was, though!"

He went down. Old Hans met him with a cheery "good-morning" in the little dark kitchen.

"I've sent Steve to Earnscliffe to let them know where you are," he said; whereupon Romaine sat down to breakfast.

It was a neat, well-spread board—even the young patrician's fastidious taste could find no fault with it. He sipped his coffee, toyed with a cluster of water-lilies that some one had placed in a glass at his right hand, and wondered where the graceful girl-figure was that he had seen in that room the night before. She was gone, certainly.

"A spirit of the surf, perhaps," he said to himself. "Faith! she was handsome enough for one."

He knew that the Earnscliffe carriage would be sent for him at once, and rising from the table he went to the window and looked off down the beach.

"She fanned my life out with her soft little sighs;
She hushed me to death with her face so fair,"

sang a full, clear voice just outside the window. Romaine caught up the words:

"I was drunk with the light of her wild blue eyes,
I was strangled dumb in her long gold hair."

He leaped out and stood by the singer. She was sitting in the low porch, in the shadow of a silver-leaved poplar, with needle and mesh-block, and a pile of nets at her side. Her shining head was bowed; her graceful brown fingers were flying through her work like mad.

"Little beauty!" muttered Romaine, under his breath.

She looked up.

"Do you read Owen Meredith?" he said, leaning, handsome and smiling, against the framework of the porch.

"Sometimes."

Romaine lifted his eyebrows.

"You are not," he began—"that is—Hans is not——"

She understood him. Her voice had a touch of bitterness in it.

"Hans is my father; Stephen my brother."

"Jove! what a freak of fortune!" he exclaimed to himself.

She went on with her work silently. Romaine was gravely looking down the beach to the sea.

"Are you never lonely?" he said. "This is the dreariest place in the world, I think."

"Is it? I never knew any other place."

"And are you always alone here?" asked Romaine.

She made a quick, slight gesture.

"Always."

He watched her intently. There was a carriage rolling swiftly across the beach in the morning sun, and he knew it.

"I must thank you, Miss Hagar, for your kindness to me last night. I shall never forget that I owe my life to your father and brother."

Her wide, black eyes opened.

"There is no need of thanks: they would have done the same for any one."

Romaine bit his lip, half-smiling beneath his heavy mustache.

"Say good-by to me, Miss Hagar."

Hagar looked up. A light open carriage, drawn by a pair of superb gray horses, had stopped at the very door. It had two occupants—one, a tall, gray-haired man of fifty, perhaps, with a cold, aristocratic face; the other a young girl—Squire Earnscliffe and his daughter, Hagar knew.

Romaine leaped down from the porch. One moment of quick, gay greeting, and he had Edith Earnscliffe's exquisitely-gloved hand in his own; he was looking into her smiling, pearly face. It was clear-cut, beautiful, with hair the color of ash and gold, eyes blue, and bright, and scornful, and thin lips, scarlet red. She leaned forward, with the long white plumes of her hat dancing about it enviously.

"We were martyrs at Earnscliffe last night—one and all. I shall never forgive you."

"Never," said Romaine, gallantly raising the slight hand to his lips. "Then I had better have drowned."

"Come into the carriage!" she commanded, smiling.

Squire Earnscliffe turned the gray horses, and made room for Romaine among the crimson carriage cushions.

"How have these people treated you," he said.

Romaine paused with his foot on the step.

"With all due hospitality. Here is my host: let me make my adieu."

Earnscliffe looked around him for the first time with something like interest. The first object that met his sight was Hagar, mending her nets in the old porch as composed as if the figures in that glittering carriage were so many crabs from the sands below; the next, old Hans, standing in the door watching him.

It might have been the dark, wonderful beauty of the girl, it might have been the keen, merciless gaze of the old fisherman, but Squire Earnscliffe's thin, haughty face crimsoned and paled; he clutched at one side of the carriage a moment, then grew suddenly calm. They looked straight in each other's eyes, Hans and the rich purse-proud squire. The face of the fisherman was grave and stolid, unreadable, too, as hieroglyphics; but a faint line of tremulous whiteness came out on Squire Earnscliffe's lips. He bowed stiffly. Hans' upright head gave him no answering salutation; there was something in his face that made it for a moment as stately as a king's. He stood and watched him.

Romaine leaped into the carriage. It dashed off madly down the beach.

"Is that man's name Eckhart?" said the squire.

"Yes," carelessly from Romaine.

"And that girl?"

"His daughter."

Edith tapped his shoulder lightly, whispering behind her finger-tips:

"What a lovely face! Were you making love to her?"

He laughed.

"*Non, mademoiselle.*"

He did not know that Hagar Eckhart had dropped her work in the old porch, and was watching the retreating carriage with large, restless eyes. The shadow of the silver poplar tree stretched at her feet dark and heavy, and another smaller shadow.

"Hagar!" said old Hans.

She started as if she had been dreaming. Hans was looking down at her with knitted brow.

"My girl," he said, sternly, "I hate Squire Earnscliffe, I hate his house, and he hates mine. Will you remember it?"

Her eyes dilated.

"And, Hagar——"

"Father?"

"That boy must never come here again; his hands are too white, his face too handsome. Do you hear?"

"Yes, father."

"Then go in."

She turned like an empress, with a bright spot on either cheek, and obeyed him; and old Hans stood outside in her place, sullen and silent, looking darkly off towards Earnscliffe.

CHAPTER II.

SEPTEMBER on the shore. The blank day was dying out in a fiery sunset of tan and scarlet. Hagar Eckhart, crouching on a point of rocks a half mile down the sands, saw the windows of Earnscliffe flaming weirdly in the light which shot off at last into the pine-tops nodding above them like a brotherhood of cowled friars. The surf was creeping up the sands. It was with a tinkle of sparkling crystals, a splash of black, wind-swept waves, a roar. Stephen's great dog bounded from it up the rocks, dripping, and crouched down with wistful eyes at Hagar's feet.

The spot had become very dear to Hagar. Sheltered in among the hollows of the brown rocks, she passed hours in watching sea and clouds, and thinking her own wild thoughts. Stephen had the inn: Hans, his pipe and boon companions;—who knew or cared!

A sound of voices and low laughter rose suddenly from the sands below. Hagar held the growling dog with both hands and looked down.

A pretty, brightly-painted row-boat had just grated against the shore, and its occupants, two or three stylish masculine figures, and a group of ladies in a gleam of rich Indian shawls, plumed caps, and shining dresses—were landing gaily on the wet, slippery shingles—ladies and gentlemen from Earnscliffe, of course. Such a gay picture as they made on that dark desolate beach! It was like a glimpse of fairy-land; and foremost among them, in the clear sunset light, stood the tall, dashing form of Romaine, helping some one up the rocks—a fair blonde, with a bunch of wild flags in her hand.

It was Edith Earnscliffe. The long golden hair, streaming in loose curls on the wind, the exquisite figure, the slow grace of movement, could belong to no other.

A moment, and Romaine had drawn the boat up the sands, secured it, and was sauntering off towards Earnscliffe with the fair blonde on his arm. The rocks were alone once more with their pet children, Hagar Eckhart and the sea-gulls.

She dropped her face against the rough rock, and sank motionless—a Sybarite, with her starved life stinging her like a scorpion. At Earnscliffe there were luxury, refinement, beauty—that she knew. At home, were bare walls, Hans and Stephen. Was the heiress of Earnscliffee better than she that such a gulf of difference should lie between them? But the pain passed in a moment. There was good blue blood in Hagar's veins—proud blood, too. She lifted her head, and stroked Stephen's great dog with her graceful brown hands.

"I don't care!" she said stolcally.

He growled. At the same moment a bright, glancing object fell from the rocks above into her lap. It was a cluster of gorgeous, velvety cardinal-flowers—the last of the year.

"I thought nothing but sea-gulls ever came here," said John Romaine, springing down to her side. "Miss Eckhart, you look like Undine herself sitting among the foam-bells."

"Do I?" said Hagar, dryly. "I never saw Undine."

She rose up as he spoke, fairer than a half-dozen Undines. That pure Greek face, with its dark, drooping eyes, and raven braids, and scarlet lips. Romaine's intent gaze brought no flush to it, but the mouth curved haughtily, and he understood and looked away.

"I saw you from the boat," he said. "I have haunted this shore for weeks just to see you once."

Frank, at least. She answered in the same dry tone:

"I am sorry."

"You need not be—my reward has come at last."

Her eyes looked wicked as she glanced up at the cold, gray clouds.

"It is going to rain. Boatswain, you and I must go home."

Boatswain poked his cold nose into her hand, ready and willing. Romaine was not.

"Wait!" he pleaded. "May I not see you sometimes, Miss Hagar? Let me be your friend."

She drew back proudly.

"You are very kind, but——".

"What?"

"Never try to see me. Your place is at Earnscliffe—mine, in that humble fishing-hut over the marshes."

She turned imperiously, and calling to the dog, leaped down from her perch and ran away up the beach, leaving John Romaine standing half-angry, yet admiring old Hans Eckhart's daughter more profoundly than he had ever admired mortal woman before.

"Jove!" he muttered, starting off towards Earnscliffe, "she ought to have been born a queen."

Hagar went on her way, swinging her sun-bonnet in her hand, her black eyes cast down, and her red lips pressed tightly together. It was growing dark, and the tide was coming rapidly in behind her, and the wind whistled shrilly across the sands. She looked back once, but the tall, handsome figure had disappeared.

"Hagar!" called a voice. Stephen came across the shingles, hurried and pale. "I've been hunting for you, Hagar. Come home."

She grasped his arm, pale to the lips, his voice was so strange and ominous.

"What is it, Stephen?"

He rubbed his jacket-sleeve across his eyes. It was a warm heart.

"Father," began Stephen, jerking the words out laboriously,—"he's in a bad way—he is, Hagar."

She stared at him dumbly.

"He started for the harbor with Skipper Gale just arter noon," Stephen went on; "and the skipper rowed back afore sunset with him in the bottom of the boat face up'ards, and he ha'n't spoke or stirred since."

One low, pained cry, and Hagar was rushing up the path, panting hoarsely through white lips. Lone, dark shore, and lonelier, darker sea, danced before her. She loved her old father in spite of all.

The door of the little low dwelling was open. She went in noiselessly. Hans lay on his bed with closed eyes, and his worn old face upturned in the dying light. She threw herself down beside him.

"Father!"

A low groan. Stephen came in and stood at the foot of the bed with the old hamlet doctor. The latter shook his head vaguely.

"He's got a fit—bad. Folks die in 'em sometimes."

Hagar crouched low at the bedside, and took up the hard, cold hand of the old fisherman, caressing it mutely. Three weeks before, in that very room, Romaine had lain, one dreadful night, senseless and half-drowned. Did she remember it?

The dark crept in thickly. An ominous woeful dark it seemed to Hagar. The dull, red firelight flickered feebly on the wall, a gust of wind bowled through the poplars; then the old man's lips moved—it was only a whisper, but Hagar heard it—

"*Earnscliffe!*"

She touched his rough hand with her lips.

He groaned out the word again.

"Father!" cried Hagar.

The glazed eyes opened slowly and turned on her face.

"Hagar—little girl!" in a faint whisper.

She bent down to him. His old face grew so strained and wild in his effort to speak.

"Can you go to Earnscliffe, Hagar?"

"Yes, father."

He gasped: "Tell the squire I want him."

"Yes, father."

"He will know."

The gray head fell back. Hagar leaned over and kissed him madly, despairingly—the next moment she was out in the night.

A wild way—a long, dark, desolate way. It was raining, too. Hagar started from the door like a hunted wild creature. The mist came driving in from seaward, the waves dashed fiercely across the bar, and down on the shore, the red, unwinking eye of the lighthouse was watching sleeplessly. She ran on across the marshes, along the sandy beach-road, through the dwarfed black pines, till she reached the arched gateway that led to the Earnscliffe grounds.

From the windows opening upon it a broad patch of light was streaming across the veranda which shaded the front of the house. Some one was pacing to and fro there, smoking a cigar whose subtle Cuban odor filled the misty air with fragrance. Hagar sprang upon the veranda in the broad patch of light, and stood face to face with John Romaine.

Such a picture as she made! Romaine uttered an exclamation, and dashed his cigar into the shrubbery.

"Miss Eckhart! Is it possible?"

The great wild eyes looked up to his.

"Where is Squire Earnscliffe?"

Romaine drew her into the hall.

"Do you want to see him?"

"Yes."

He flung open a door at the foot of the staircase.

"Come in."

It was a room, long and low, and paneled with carved oak. The floor was hidden in a soft, thick carpet, green as swamp-mosses, and across the tall windows amber satin curtains were sweeping in heavy shimmering folds. There were low, easy-chairs of polished scented Indian wood, upholstered with deep green leather, standing here and there, and sofas, piled with amber satin pillows that looked like sunshine sleeping on some green June hill. A fire burned in the grate, and on the mantel of Egyptian marble a cluster of waxen camellias stood in an exquisite Indian vase. Over them, half in light, half in shadow, hung the only picture in the room—a purple, tropic sea, sleeping in misty moonlight, with two milk-white sea-gulls perched on a gray, wrinkled reef.

Two figures there. Squire Earnscliffe, pacing to and fro before the fire, with his hands crossed behind him; and his daughter, sitting near in an evening dress of violet silk, with its wide sleeves falling away from her bare white arms, and her golden hair gathered into a knot of shining curls at the back of the lovely head.

Squire Earnscliffe stopped short in his promenade as the door opened. Romaine held it for Hagar to pass through.

"Miss Eckhart!"

He knew her. His thin nostrils dilated. Hagar stood, still and pallid, on the threshold.

"I came to ask you to go to my father, Squire Earnscliffe. He is ill—he sent me to tell you."

A flush shot across Squire Earnscliffe's face. He repeated the word mechanically.

"Ill?"

"Yes," catching her breath.

He looked at her strangely.

"Did you come all the way for me alone?"

"Yes."

"You are a brave girl!"

Hagar felt herself drawn forward into a chair. A moment afterwards Squire Earnscliffe was standing beside her with his cloak on and his hat over his brow.

"Remain here till I return," he said; "it will not be long."

She comprehended, and tried to rise up, but he held her back.

"I am going alone. Stay here and rest!"

Something in his manner cowed and frightened her. Miss Earnscliffe was looking at them both with wide-open eyes.

"Papa, it is raining."

"I know."

"Then I would not go."

He looked at her darkly. The jewelled hand, holding his cloak together at the throat, trembled.

"You would not? There are some voices I must follow if they call me to perdition."

"Papa?"

"Be quiet. I will come back in an hour."

His heavy-booted foot stirred the echoes in the hall a moment, then the door clanged sullenly behind him. He was gone. Hagar sat alone with the heiress of Earnscliffe.

The blue, scornful eyes surveyed her from head to foot with a sort of latent wonder that was half admiration. In the fire-light, Hagar's face had taken a feverish beauty that was almost painful. Miss Earnscliffe's clear, contemptuous voice broke the silence.

"What has that—that person to do with Squire Earnscliffe? Do you know?"

"How should I know?"

"Has he told you nothing more?"

"Nothing."

Miss Earnscliffe settled back in her chair, with half-closed eyes, the golden lashes drooping, and band and bracelet flashing in the light. She was mystified, annoyed; and she was hoping John Romaine would not come in to play chess with her while Hagar sat there. He did not. His quick step echoed in the hall, passed the door, and went on up the stairs till it was lost in silence.

An hour passed so,—a dreadful, silent hour. It seemed an eternity to Hagar. Would the squire never come? Why was she sitting quietly under the roof of the man her father hated, while down on the desolate shore he lay dying, perhaps? She started up.

The door was flung open, and Squire Earnscliffe came in. Rain was dripping from his cloak,—

his set face was dripping with it. Hagar strangled the cry that rose to her lips.

"Papa!" cried Edith,

He passed her to Hagar. The fire-light, the low, sumptuous room danced before the girl's eyes as he stood looking down upon her.

"You will not go back to-night,—this is your home now," said the strained, hard voice.

She stared at him dumbly.

"Yours as long as mine—remember it."

She flung up her arms.

"Is he dead?" she cried out.

"He is dead."

She fell a dead weight on his breast. Tired heart and tired frame could bear no more,—Hagar had fainted quite away.—To be continued.

HYGIENIC HINTS.

A simple and effectual remedy for dyspepia is to abstain from drinking immediately before and during meals, and for an hour afterwards.

The Sleep of Children.—The Herald of Health cautions parents not to allow their children to be waked up in the morning. Let Nature wake them; she will not do it prematurely. Take care that they go to bed at an early hour—let it be earlier and earlier, until it is found that they wake up themselves in full time to dress for breakfast.

How to Cure Swelled Feet and Ankles.—Take plantain leaves (which can be found in almost any grass plot, and in our public parks;) wilt them by putting separately between the hands; cover the swollen parts with them, and keep in place by wrapping the limb with rags or a towel on going to bed at night, or keep them on during the day if not obliged to be upon the feet. A cure will be speedily effected.

Scalding of the Throat from Swallowing Boiling Water.—This accident occurs not uncommonly among children left by themselves, and is very dangerous, as the throat swells, and the sufferer is in danger of being suffocated. Send for the medical man immediately. Meanwhile, if it can be procured, let the patient suck ice constantly, and apply a strong mustard poultice to the outside of the front of the throat.

To Remove Warts.—The best application is said to be that of monohydrated nitric acid. The ordinary acid should not be used because its caustic effects extend much farther than the points touched, while the action of the stronger acid here recommended is limited to the parts to which it is actually applied. Nitrate of silver is also frequently used with advantage, and of late a concentrated solution of chloral has been spoken of as efficient in destroying warts.

Sprains.—If the sprain is nothing more than a sprain—that is, if no bones are broken or put out—wrap the part in several folds of flannel which has been wrung out of hot water, and cover it with a dry bandage, and rest it for some days or even weeks. Entire rest at first, and moderate rest afterwards, are absolutely necessary after a sprain. If it is in the ankle, the foot should be raised as high as may be comfortable; if in the wrist, it should be carried in a sling.

To Relieve Children When They Get Beans Or Buttons, etc., In Their Noses.—Parents are often puzzled to help their children when they get beans, buttons, etc., in their noses. The Medical Record says, "Blow the patient's nose for him, by closing the empty nostril with your finger and blowing suddenly and strongly into the mouth—an efficient method which has often succeeded when instruments have failed. The glottis closes spasmodically and the whole force of your breath goes to expel the button or bean, which commonly flies out at the first effort."

Importance of a Clean Skin.—Most of our invalids are such, and millions of more healthy people will become invalids, for the want of paying the most ordinary attention to the requirements of the skin. The membrane is too often regarded as a covering only instead of a complicated piece of machinery, scarcely second in its texture and sensitiveness to the ear and eye. Many treat it with as little reference to its proper functions as if it were nothing better than a bag for their bones. It is this inconsideration for the skin that is the cause of a very large proportion of the diseases of the world. It as claimed by some scientists, four-fifths, in the bulk, of all we eat and drink, must either pass off through the skin or be turned back upon the system as a poison, and that life depends as much upon these exhalations through the skin as upon inhaling pure air through the lungs, it must be of the most vital importance to keep the channel free.—*Hartford Times.*

Pitting in Small Pox.—Mr. Gregory, of Merchants' College, Blackpool, England, believes that "pitting," the sad and permanent results of small-pox, ought rarely to be seen in any civilized community. He starts with these facts, that poor people are pitted least, rich people are pitted most, and no class of people are pitted under their dress. Poor people have less light in their homes, the rich plenty of light, and under the dress there is less light than in either case. The explanation is a scientific one. The sunlight consists of three primary colors. The red, the blue and the yellow rays, have distinct and characteristic properties. The yellow gives us light and red gives us heat, and the blue actinism. It is the actinic influence of the blue rays which, in Mr. Gregory's theory, causes "pitting." No seed will germinate and the young plants will soon perish if the chemically active rays—that is, the actinic rays—are filtered from the sunlight. A yellow blind drawn over a window will absorb all the actinic rays. The pus of variolar pustules absorbs, by its yellow medium, the actinic rays, which results in corrosion of the tender flesh at the base, and thus leaves the dreaded permanent "pitting."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

LIGHTNING AND KISSES.

The storm is coming on apace;
The trees begin to shiver;
Big drops of rain drum on the pane,
And set me all a-quiver;
The clouds are black as ink, Oh—oh!
How vividly it lightened!
And this promontory bush:—
Joe, I am sadly frightened.
"No wonder, darling you're afraid
In such a storm as this is;
But never fear the lightning, dear,
I'll blind your eyes with kisses."

It's driving down upon us now:
The very house is rocking;
Wind-currents roar, rain-torrents pour—
Oh, how my knees are knocking;
The thunders crash and roll as though
The sky had split asunder;
Joe, I shall surely faint away
I'm so afraid of thunder.
"Darling, you well might faint away
In such a storm as this is;
But never fear the thunder, dear,
I'll silence bring with kisses."

It's such a catching season, Joe,
I'm in a constant panic;
There's that about a thunder-cloud
Which seems almost satanic.
What did you say, Joe—that you wish
'Twould come on every day so?
You cruel fellow—let me go—
How do you dare to say so?
"Of such a cruel wish, my dear,
The explanation this is:
The grass and grain need frequent rain,
And I—need frequent kisses.

[*Springfield Republican.*

BREAKING GROUND.

B. C. D.

If Aunt Susan, whose talk at the quilting-bee about flower gardens was reported in the Rural of 4th May, could have known the meditations of Mrs. Morse as she started homeward from the quilting, she would surely have thought that she had not spent that day in vain. Little as it seemed, this had been quite an eventful day with the busy farmer's wife. It was rarely that she could leave her children—of five and two years—in as good hands as those of Mother Morse, who was making them a brief visit, and to-night, as she started home on foot, it was with the pleasant thought that she need not hurry this time, for all the evening work would be done before she reached home. She had one accomplishment that she prized, she was a good pedestrian and when she could shake off her household cares, she enjoyed a walk. Therefore, on this charming May evening she took the longer route home, as that way led past Aunt Susan's door again. "How lovely everything looks," she thought, as she went along. "How well the place and mistress seem in accord; well they may, when all this order and beauty is the result of her patient efforts." "How nice it looks to see the yard and garden all in one inclosure: most yards have too many trees to be cheerful, but if Aunt Susan has a weakness, it is for plenty of air and sunlight. There is plenty of evergreens and other shade trees, but they are not so near the house as to make it gloomy.

Thus musing, our farmer's wife reached home and viewed her own neglected premises with more favor than usual, for she thought she had now an intelligent idea how to improve them. She, however, warned by past experience, kept her plans to herself, for fear that busy, tired John would chill her enthusiasm by discouraging words.

But the quilting had done her good in more ways than this one. The little excitement of meeting near and distant neighbors whom she did not often see, had quickened her stagnant pulses and made her feel as if she was really one of the world after all. She had begun to get morbid for lack of society, and even heedless. John now remarked her unusual vivacity, and laughing, advised her to turn out to quiltings oftener, as it seemed to have a good effect on her.

The next morning, before her work was well out of the way, a boy came to the door, who proved to be a motherless grandson of Mrs. Brown's (Aunt Susan), who had brought her some pink roots which his grandmother had sent, and said he was told to stay if he could be of any use, and help her fix a place to set them.

Her favorite flowers! Happy tears filled the little woman's eyes, as she went out with her spade to break ground for future operations.

"There are some hollyhock roots, too," said the boy, as he emptied the basket; "Grandmother thought maybe you might like old-fashioned flowers, too; and besides, here are some sunflower seeds, that are nice and healthy to plant around drains at the back of the house. The hollyhocks are best in some corner, out of the way."

After some time and effort, the roots were all safely set out, and even guarded by a row of little stakes driven in around them to protect them from the fowls, or any other trespassers on the domain. Then thanking the boy for his kindness, and casting a threatening glance at the weeds that grew about the door, Mrs. Morse went into the house well pleased with her beginning. As she hung up her sun-bonnet, Mother Morse said, "Sarah, I was in hopes that you did not care for having flowers or anything else in the door-yard. They all seemed to think their premises were an agricultural museum, in which to exhibit every old, worn-out machine they ever had. The drag and the corn-marker have often hung all summer on the fence in front of the house, and I see that John is not a bit better than his father about that. I've shed tears many times when my plants have been run over or destroyed by the cattle breaking in," and Mrs. Morse heaved a deep sigh at the recollection.

This was sympathy from an unexpected quarter, but like a wise daughter-in-law, Sarah Morse made no comments. What Mother Morse said voluntarily was all very well, but she would probably have resented the same freedom of criticism from any one else. When John came into his dinner she said to him: "If you would take the rail fence away between the garden and door-yard, and put the rails on the outside fence, it would be high enough to keep the cattle out then, and we don't need any fence where that stands."

"Well, maybe I will after planting," said easy John, who was remarkably amiable in the way of promises.

"No time like *now*," remarked his mother.

To the surprise of both women he did, after dinner, fix the fence as they suggested, around the outside of the garden; but with true masculine egotism he took all the credit of the idea to himself.

OUR DAUGHTERS.

Shall they be Protestants or Catholics?

We commend the following article which appeared in the Christian Union of 3d July, to the careful attention of those parents who have any idea of sending their daughters to Roman Catholic schools or institutions. It is estimated that there are in this country some thirty-five thousand girls from Protestant families in attendance upon Roman Catholic schools, and it is claimed by the managers of these schools that one of every ten girls in these schools is converted to the Roman Catholic faith; that three of every ten learn to hate Protestantism for life, and that the large proportion of the whole become indifferent for the rest of their lives to all Protestantism. Parents would do well to count the cost before taking any chances in a matter of such vital importance. In the following the difference between the systems of the two classes of schools. Protestant and Roman Catholic, is set forth.

America now has three colleges for women well worthy of the name—Smith, Wellesley and Vassar. We place them here in the inverse order of their establishment: Vassar alone is old enough to send forth a graduating class; Wellesley will do this for the first time next year. Each has its peculiar advantages; either can and does give to the daughters an education, if not fully equal to that which is given by Yale or Harvard or Amherst to the sons, one as nearly equal as can be afforded by a system that has not yet had the full ripening effect of age. As we sat in the chapel of Vassar College last week, we could not but think of the labor and toil, the disheartening repression from father and friend and husband, in the face of which Mary Somerville gained her education; and we wondered what her father, who feared for her brains if she studied mathematics, would have said to the mathematical address delivered by one of the graduates that beautiful June day. There were, if we remember aright—we are writing without the programme before us—one song, two piano pieces, and ten orations. We advisedly call them orations. With one exception they were delivered without notes; with no exception they were delivered with graceful action; and in at least two instances with all the fire and warmth of genuine oratory. We do not know what Dr. Craven and the Presbyterian General Assembly would say to Vassar College. The best possible answer to the declaration of that august body that women cannot preach, for it is contrary to their nature, is such an address as that of Miss Stanton and Miss Wilkinson. They each did preach; without the fear of St. Paul before their eyes.

As we sat there, we also called to mind another graduating scene which we attended some fifteen years ago at St. Mary's in the Woods, in Indiana. It was, and we believe still is, one of the foremost Roman Catholic colleges in the West. We went by invitation. There was a long hall full of the elegant specimens of the young ladies' embroideries and fancy needle-work; there was some music—mainly instrumental; there was some beautiful herbaria of dried flowers, that had been gathered in the woods; but there was not an essay read, or a paper of any description; and with a class that must have numbered a score or more, there was in geometry one pupil. Rome does not change; and apparently her conventual education is now what it was fifteen years ago. We judge this from reading the newspaper report of the graduating exercises of the senior class of the Convent of the Sacred Heart of this city, attended by his excellency Cardinal McCloskey and the Roman Catholic clergy in large numbers. Here is the account:

"The exercises were begun with a piano solo, 'Quis est homo,' and 'Cujus animam,' selections from Rossini's Stabat Mater. Then followed an original operetta by ten young ladies, one of whom represented the Queen of May. Under an arbor of evergreens, where was placed the Queen's throne, the little plot was unfolded. It was particularly designed to display the clever training which the students receive. Plaintive and pathetic airs sung by a band of youthful gypsies, dressed in fantastic colors, were mingled with the bright and happy melodies of the May party. A soprano and contralto duet called forth much applause from the visitors. The play occupied a half hour. Miss Marie Willard, who amused the assemblage last year with 'Why the dog's nose is always cold' obtained an encore this year by humorously relating her experience with cats. All the young ladies were then crowned with wreaths by the Cardinal. Many of them received books as a mark of excellence in their studies."

We suppose that there are still some Protestant mothers who are insane enough to imagine that there are no schools like those of th convents. It depends, Madam, upon what you want to give your daughter. If you want to make her docile and obedient and subservient, ready to take without questioning her knowledge from her husband at home or her clergyman at church, by all means send her to the convent school. But if you believe that God made woman as well as man in his own image, if you believe that she has an independent right to exist, that the answer of the catechism is as appropriate for her as for him, that her chief object in life is "to glorify God and enjoy Him forever," if you repudiate the philosophy that would substitute "husband" or "society" for that august word "God" in this admirable reply, if you want her to learn to think for herself, if you are willing to risk the possible evils of some crude thinking in her first efforts after a reasonable independence—if, in short, you want to make a woman of her—then you will give her a Protestant education. For graceful appendages to man and ornamental adjuncts to society, the Convent of the Sacred Heart; for a true womanhood and motherhood, a character that will command the respect, and, therefore, the permanent love of husband and children, then Wellesley, or Smith, or Vassar, or some one of the many institutions smaller in numbers but similar in spirit.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

Sarah L. B.—For a reply to your inquiry about face powders, I refer you to the following extract from Druggists' Circular:

Face Powders are made of many different substances, and used for a variety of purposes. Some are nothing else than plain dry paint; of that kind the finest and best is probably the subnitrate of bismuth, obtained very light by certain processes. Bismuth as a cosmetic cannot be called a new discovery, since it is said that the face paint used by Jezebel was a compound of that metal, but it is still unequaled by any other. It is without deleterious effect on the economy, and nearly harmless to the skin, but has the disadvantages of being expensive and of becoming black when exposed to sulphurous vapors. Next in order comes oxide of zinc, or zinc white; the finest qualities produce very good face paints. Oxide of zinc is generally considered innocuous, is not expensive, and is not affected by sulphurous exhalations; but, if long employed, it causes the skin to become rough and coarse-grained. Of carbonate of lead, or white lead, only this needs be said, that it is poisonous, and should never be used at all. This ends the list of metallic pigments and brings us to the more common earthy compounds. Among these may be mentioned talc, or French chalk, baryta white, Paris white, and ordinary chalk. They are harmless in every respect, and quite inexpensive, but eminently inartistic, as they can be detected on the face at first sight, even at a distance; yet they are used in considerable quantities. Generally they are formed into cakes, or tablets, by means of a little kaolin, or white clay, and sold in fancy boxes. Now we come to the vegetable powders; these are properly cosmetics, and are used more for their soothing and cooling effects on the skin than for the artificial improvement of the complexion. They are also more commonly known under the name of *Toilet Powders*. The two following receipts will give an idea of their general character:

Violet Toilet Powder.—Wheat starch, 10 pounds; Orris root, 1 pound; Extract of cassia, 2 ounces; Tincture of musk, ½ ounce.

Rose Toilet Powder.—Corn starch, 12 pounds; Powdered orris root, ½ pound; Oil of rose, 1 drachm; Tincture of civet, 1 drachm; Tincture of musk, 2 drachms.

The various blooms and creams, more or less advertised everywhere, are said to be bismuth or zinc white simply suspended in rose water. Some of them, on being analyzed, have been found to contain large quantities of white lead, a very dangerous application to the epidermis.

Mrs. Ella Thompson, Venango Co., Pa.—It is claimed the Parisian method of cleaning black silk is superior to any other. The *modus operandi* is as follows: The silk must be thoroughly brushed and wiped with a cloth, then laid flat on a board or table and well sponged with hot coffee, thoroughly freed from sediment by being strained through muslin. The silk is sponged on the side intended to show; it is allowed to become partially dry, and then ironed on the wrong side. The coffee is said to remove every particle of grease, and restore the brilliancy of silk without imparting to it either the shiny appearance or crackly and papery stiffness obtained by beer or indeed, any other liquid. Experiment on a silk apron, cravat or tie, and you can then judge whether too much is claimed for it.

Farmer's Wife.—Paisley shawls range in price from $10 to $50. A good quality is purchasable for $30. This is the genuine article. Your brown cashmere would look well, trimmed either with silk or velvet. The latter is especially popular this season for woolen goods.

A plain, short skirt, ornamented with a box-plaited flounce, set on so as to form its own heading (or if you prefer it kilt-plaiting, makes a pretty finish), with basque and "washerwoman" overskirt, would be suitable for your goods. If you would rather have a polonaise, some one of the models published in Rural, will be very appropriate.

Mrs. Jas. B. D., Marquette, Kansas.—I sent pattern 6,341, as ordered. Satin and brocade are the fashionable trimmings for black silk dresses The piping can be of either one of these materials. Crochet or embroidered buttons would be most suitable.

To make the polonaise it will require 10½ yards of material, twenty-two inches wide. A kilt-plaiting would be a pretty finish for underskirt. Cannot say how many yards will be required for suit, as I do not know whether you intend to make all of the skirt of silk. In a week or two I shall publish several models of out-door garments for ladies, and among them the Ulster.

Domestic Economy.

MOP-HANDLE PAPERS.—No. 5.

MAY MAPLE.

Self-imposed Duties.

"Oh, dear! I'm nearly tired to death," said Mrs. Busy, as she dropped into her easy chair which stood invitingly near an open window that looked out upon a perfect mass of fragrant blossoms; "and yet," she continued, "I ought not to sit down here for a single minute; for it is almost ten o'clock and there must be some pies or a pudding made for dinner, the bread is almost ready to mold out, and the vegetables are to be brought from the garden and cleaned. And I declare this yard looks as though it was deserted; the weeds are getting such a start again, and the garden is worse still. I ought to finish May's dress to-day, and I *must* do that, so she can have it to wear to the picnic to-morrow. If it wasn't for the ruffles it wouldn't seem like such a job. And there's a whole basketful of clothes waiting to be ironed; the mercy knows there's no end to the work in this house! I believe it will make me crazy yet. I *mustn't* sit here another minute; though how I can ever get one-half of the work done that *ought to* be done this very day, is more than I can tell."

And she arose, not hastily, but as though many tons' weight were pressing upon her shoulders. And I wondered how many thousands were burdening themselves in the same manner; growing old, faded and worn-out long before their appointed time.

Now I am going to enter my protest against such a wholesale waste of strength, beauty and talent. In the first place, there is no *actual* must about doing or trying to do six days' work in one. The good Lord set us an example of taking an abundance of time wherein to do our work. I admit there are some things that need a housekeeper's daily attention. There are but few farmers who are willing to accept of cold victuals for breakfast, dinner or tea, no matter how highly various cooks may recommend the fashion. But it is all nonsense to think one *must* wash, bake, iron and churn, do the family sewing, patching and gardening all in one day.

If the bread is getting "beautifully less," it is one's duty to see that more is provided. And when one's strength is ebbing it is just as much a duty to sit or lie down till it is in some degree restored. It is not necessary that both the ironing and baking be done on the same day, when there is but one pair of hands to perform the labor and one pair of feet to take all the steps. Neither is it necessary that May's dress should be finished to wear to that picnic; she has another dress she can wear that will answer quite as well; if she has not, better dispense with the ruffles and overskirts that are such a bother to make, and a worse one to iron, and give her two plain ones, so that she will not be distressed for an extra robe, especially if she is not old enough to make her own dresses or do some of the work about the house.

Rest, if only for a few minutes, when you have finished hurrying through the morning's work For one does feel in a hurry from the time one gets out of bed in the morning, till the breakfast is over, bread put to sponge, the milk skimmed, calves fed, churning done, dishes all washed, beds made, rooms swept and furniture dusted and put in order. After all this exercise of mind and body it is certainly time to rest and insist upon taking rest. While you are sitting down, if you are a reading woman—and I hope you are—don't be afraid of wasting the minutes if you take up the last paper or magazine that John has thrown upon the table half opened, and read a paragraph or perchance an article. It may give you a pleasant thought, or many of them; and pleasant thoughts relieve one greatly from weariness. If possible, do something in the course of the day that you *love* to do, if only for fifteen minutes, just as you did in your girlhood. Slip quietly out of the treadmill to your own sanctum, perhaps to knot a ribbon, rearrange a loop on your hat or crimp a ruffle, when no one knows your whereabouts. You, no doubt, remember what a rest there was in the perfect quiet, when only the chirp of the robin in the orchard was heard, or perchance some wildwood bird broke the silence with its sweet carol. At all events, *rest*

It is just as much a religious duty to rest before you have exhausted all your powers, as it is to pray for strength and guidance in all your life-work.

A HOUSEKEEPER'S DREAMINGS.

I am looking away to the sunset,
The day-dreams are hushed and still,
And the twilight falls gently around me
With a thought that my heart doth chill:
Is the daylight of life now fading?
Are the shadows of even at hand?
Is the sunshine so soon to leave us
For another and brighter land?

My eyes strayed from the paper where I had carelessly scribbled these lines to the book beside me, and I read: "Great things are not accomplished by idle dreams, but by years of patient study;" and I said to myself, "Nowhere does that sentence apply better than to the routine of housekeeping, where day-dreams are often so rudely dispelled, and the practical part of living is ever before our eyes. Breakfast, dinner and tea—it is one steady routine, as spring is followed by summer with its different needs, then autumn and the long winter for which so much preparation is made." I look at city ladies, and think sometimes how little they know of the cares and responsibility of country housekeeping; but I do not envy them the freedom which is bought at the expense of so much we can enjoy; though we value it so little until perhaps by some chance we miss it. So farmers' boys who go to learn city trades, still recall longingly the luxuries that were to be had in the old home without money and without price.

And speaking of this, who that thinks of these things has failed to be impressed with the fact that the best and smartest boys of a household are thought too good for farm life. "What a pity!" I say, when I hear of some wide-awake boy who leaves his home for the new ways and work of a town. For, in agricultural science, *brains* are much needed, and the labor-saving implements now in use, require skill and efficiency to manage them to advantage. Physical strength and muscular force are not so much needed in the management of a farm as they were twenty years ago, and it would be a good thing for the country if parents would consider this when guiding the destinies of their children. And you, my readers, who are mothers and indulge at times in dreamings like mine, know well this to be true. Annie L Jack.

DOMESTIC RECIPES.

Grape Catsup.

The following is a reliable recipe for Grape Catsup. I can safely promise those that try it. a delicious relish for cold meats. We like it on our bread and butter. Four pounds of stewed grapes, boil and rub through a coarse sieve; one scant quart of vinegar; one tablespoonful each of ground cloves, allspice, cinnamon, nutmeg and pepper; one-half tablespoonful of salt. Add the grape pulp and boil until thick.

Can any of the Rural ladies furnish a good, reliable recipe for Boston Brown Bread?

Oil City, Pa. Mrs. V. F. K.

News of the Week.

Monday, Oct. 7, 1878.

POLITICAL.

The Butlerites of Massachusetts are busily organizing Butler Clubs and Ben himself is delivering campaign speeches at the rate of about one a day. Talbot, the republican candidate, has written a very handsome letter of acceptance of his nomination and the accompanying platform. In it he forcibly denounces soft money and its advocates. Abbott, the nominee of the straight-out democrats, seems to be on a still hunt—at any rate whatever noise he makes is not heard outside the State. Butler is losing large numbers of his followers and is pretty certain of being disgracefully defeated—at any rate all his enemies say so. President Hayes said lately, out West, that the worst of the greenback craze was over, and that the public were rapidly returning to their senses and to a preference for specie over paper money—and in these opinions he finds agreeing with him a multitude of stalwart republicans who agree with him in little else.

On Sept. 28th Secretary Schurz delivered an elegant speech at Cincinnati in favor of "hard money," national banks and preserving the good faith of the government by paying the national debt and its interest, in gold. 'Twas a fine effort; but it seems hardly to have been appreciated by Secretary Gorham, of the republican campaign committee at Washington. Gorham concedes that it was a fine speech, just as the letters of Junius and Addison's articles in the Spectator were fine productions, but he says that it is not, in his opinion, adapted to campaign purposes, and accordingly he declines to print it for circulation among other documents intended to influence the coming elections. Gorham is more than suspected of being a greenback republican,—a kind of republican much more numerous among the hard-fisted toilers of the West than among the kid-gloved capitalists of the East.

MISCELLANEOUS.

It having been charged that the government misses a quarter of the taxes on imports through our inefficient system of collecting them, the Treasury makes, in short, the following statement. The customs revenue service employs 3565 persons and collects $132,024,000 at a cost of $5,525,767, or 4.1 per cent. This is against a cost of 4.8 per cent in Great Britian where the coast line to be watched is very much shorter, the number of dutiable articles very much less, the rates very much less, but the total collections very much larger. Now would it not be well if a like increase in the cost of collecting our import duties were attended with a similar increase in the total amount collected? Cyrille Dion, the celebrated billiard expert, died last Wednesday, at the age of 35, of congestion of the lungs, while traveling to witness the Hanlan-Courtney boat race, near Montreal. This affair came off last Thursday afternoon, having been deferred from the previous day on account of unfavorable weather. For some days before the race there was a multitude of ugly rumors that Courtney had sold the race for $4000. The betting which up to that time had been pretty even, suddenly veered around to $100 to $35, and in some cases $100 to $20 against Courtney, and it is claimed that his own relatives and friends backed his opponent. Harlan won the race by a length and a half. Both the Canadian and the American, of course, deny any underhand dealing, a denial indorsed by nearly all the backers of the former and by a few of those of the latter. Courtney's umpire, in a published statement, throws a good deal of doubt on the good faith of his man, and the issue of the race has undoubtedly greatly injured the reputation of the American champion.

A decision of interest to all who buy or sell real estate has just been rendered in the Municipal Court of Rochester in this State. In February, 1877, a Mr. Rockfellow, of that city, went to the office of the County Clerk and ordered a search to made for any liabilities upon property he was about to purchase. He received a statement of the result of the search and paid the usual fee Relying upon the truth of the statement he made the purchase of the land—a farm at Perrinton. Subsequently it appeared that the record of a mortgage of about $500 had been omitted by the clerk or deputy in his search. Mr. Rockfellow brought suit against the clerk, claiming $500 damages by reason of the neglect. The case was sharply contested. The issue depended on the liability of the clerk based upon the question as to whether his act in making the search was judicial or ministerial—if he acted ministerially, it was conceded he would be liable. The decision of Judge Sill gave judgment against the County Clerk for $514.80. The case will undoubtedly be appealed, and as it is said to be the first reported case of the kind in this State, the final decision will settle the law on the question.

The National Association of Wool Manufacturers held its fourteenth annual meeting in this city last Wednesday. Its policy is to develop to the greatest extent, the production and manufacture of wool in this country. With this object it has held close intimacy with the wool-growers' associations in the West and South and has endeavored to reconcile the antagonism which has long existed between the wool-growers and the wool manufacturers—the former being desirous of getting the largest possible duties on wool, and the latter endeavoring to place the largest possible duties on cloths, with no duty on wool. The result the Association claims to have been a development of the wool-growing interests without a parallel in any other part of the world, and if the same policy is pursued for five or ten years more, it is thought that both wool and woolen goods will be exported from this country. This is by no means improbable, but certainly this association is inclined to take to itself an undue proportion of the credit for such a desirable object.

Gov. Bishop, of Ohio, who lately failed, has effected a settlement with his creditors and again resumed business. A sad proof of the spasmodic nature of the temperance movement in Ohio, a few years ago, is afforded by the statement that Columbus has now 127 more liquor saloons than it had seven years ago—an increase of over one-third. The Indian Commission have resolved on the removal of 2,500 Utes from their present position in southwestern Colorado, 200 miles from railroad facilities, to a reservation at the headwaters of the Navajo and Branch rivers, removed from white settlements but accessible to supplies, and the Utes are, for the present, satisfied. Last Tuesday a band of runaway Cheyennes crossed the Kansas Pacific track 60 miles east of Hayes City, Kansas, and when eight or ten miles north of the station, came upon a lot of cattle men, and in a hand-to-hand fight, slew 18 of them and wounded five more. They were pursued by a party of United States troops, and in a skirmish, six soldiers were killed. The Indian loss is not reported. There is a startling rumor of a widespread Indian war along the frontier. Red Cloud and Spotted Tail are reported to have started with their braves on the war path. These chiefs have long been good friends of the whites, and lately moved peaceably to new reservations, but it is said that they have been so atrociously swindled and starved by government agents that they have finally decided to avenge their injuries. If they did so by hanging or even scalping half a dozen rascally agents, the general verdict would be, "served them right;" but, unfortunately, the innocent frontier settlers are the chief sufferers from every Indian outbreak. Yellow fever is still ravaging the South, with little or no abatement. Many of the small country towns and sea-side resorts that had hitherto escaped the visitation, have been stricken during the past week, and from the whole afflicted region the cry for help is still borne northwards.

FOREIGN.

From across the Atlantic comes the intelligence of the death, by typhoid fever, of Thomas C. Booth, the celebrated breeder of Short-horns at Warlaby. The Warlaby estate, with its famous herd of Short-horns, came into his possession in 1864, on the death of his Uncle Richard Booth. He was not only among the foremost breeders of cattle, but also a capital farmer, an admirer of good agricultural horses, a ready speaker, and a highly intelligent, amiable and popular gentleman. His death will be a loss not only to the farmers of Great Britain but to those of the world. In the German Reichstag, or Parliament, a fierce struggle has lately been in progress between the adherents of the administration and the Opposition, including Liberals, Ultramontanes and Socialists. Bismarck, at the head of the former, introduced a measure for stamping out Socialism in the Fatherland. The scope of this was so wide and tyrannical that every publication, newspaper, magazine and book, would be placed directly under government supervision for an indefinite length of time. If any of them tended to favor the obnoxious party, it would be at once suppressed and its publisher and author severely punished, while the police were constituted the judges of such a tendency. All meetings about which there might be a suspicion of Socialism, were to be ruthlessly dispersed, while the participants were liable to severe penalties. On the first reading, the bill was considerably modified by the votes of the Opposition, and the time during which its provisions were to continue in operation was limited to two years and a half. This limitation was as objectionable to Bismarck as the other modifications, and he has threatened again to dissolve the Reichstag in the hope of being able to secure a more subservient assembly. The parliamentary committee, however, has read the bill a second time in all essential points the same as after the first reading. Negotiations with the Vatican which have lately fallen to the ground through the refusal of the ecclesiastical authorities to submit to the Falck laws, may probably now be resumed with a view to secure the support of a majority of the Ultramontanes.

Mr. Gladstone has lately greatly increased his unpopularity in England by publishing, in the North American Review, an article called "Kin Beyond Sea." All the Conservative press and not a few Liberal papers accuse him of glorifying in it the American Republic to the disparagement of his own country. He prophesies a glorious career for the United States, and for Great Britain a very subordinate place among the English-speaking races of the future. Some time back the Russians appointed a commission to investigate army frauds. It has just reported that corruption is widespread and implicated 500 officers, 40 of them colonels, in the misapplication of funds during the late war. It is reported from Paris that the difficulties between France, England and the United States relative to the Newfoundland fisheries are in a fair way of being satisfactorily arranged. The three Cabinets, it is said, are now drawing up a convention which will obviate any further disagreement. Meanwhile Secretary Evarts has only lately protested to the English government against the award of $5,000,000 damages given, some months ago, by the Fisheries Commission against this country and in favor of Canada, and this dilatoriness irritates Blaine and other opponents of the payment of the award.

The death of Dr. Petermann, the foremost geographer of the world, reported here last week, turns out to have been the result of suicide. A couple of years ago he obtained a divorce from his first wife, said to be a she-devil, and some months ago married another. The s. d. straightway commenced a system of persecution by letter and otherwise, which so worried him, in conjunction with a painful illness, that, at the age of 56, he stepped down and out with his neck in a halter. They have just had a phenomenal bankruptcy in Scotland by the collapse of the City of Glasgow Bank, with its fifty branches scattered throughout the country. The institution was one of the oldest in Scotland, had a capital of $5,000,000 and failed for $50,000,000. The suddenness of the calamity is shown by the statement that the shares of the bank, originally worth £100, sold on the day of the failure for £200 and within the week for £237. The failure is due to the grossest kind of rashness on the part of the directors in making advances to mercantile firms doing business chiefly in India and South America. Upwards of $30,000,000 were in this way advanced to four firms, the reputation of two of whom was anything but good. The general verdict is that a more reckless course of gambling with other people's money by any body of directors was never known. The shareholders of the bank are responsible for its debts, and thousands of these are women, orphans, and old people, who invested what money they had in this kind of security, and lived on its income. These will not only lose the sum thus invested, but they are also liable to have every dollar of their other property taken from them until the bank's indebtedness is liquidated. Not only will upwards of 750 employes be brought to distress by the failure, therefore, but thousands of shareholders, who in the eyes of the law, are partners in the business, will be brought to absolute poverty. Yet, up to the last, the management paid heavy dividends which they took out of the capital, instead of the interest of the business. It has long been the custom of our trans-atlantic cousins to point with scorn at our numerous dishonest bank officials—and unfortunately they have been far too numerous—yet among us there has been no instance of so gigantic a rascality, and few of such atrocious dishonesty.

Advices from Cassablanca, Morocco, report 377 deaths from cholera out of a population of 700 between the 17th and 19th of last month, and from 60 to 70 deaths daily from the same cause at Fez and Mequinez. The rinder-pest has made its appearance in Northumberland, north of England, despite the stringent measures adopted by Government to guard against it. The famine in Brazil, owing to protracted drought, has become terribly severe; and hundreds are dying of starvation in spite of the best efforts of the government to relieve the distress. The lack of railroads and canals in the country adds to the suffering as transportation of relief to distant districts is slow and uncertain War has actually commenced between Great Britian and Afghanistan. Cablegrams received this morning says that Ali Musjid has been taken by the storm by the British troops. Several of the independent tribes on the frontier have expressed a desire to join the British. Shere Ali, the hostile Amer has a force of 150,000 men. He has released from imprisonment his eldest son, Yakoob Khan, who is a celebrated general. There is great enthusiasm among the Indian native troops of the British army. England will not be satisfied with an apology, however, abject; she will demand solid guarantees—more territory.

Von Moltke is reported to have tendered his resignation as chief of staff. The matter will be decided when the Emperor resumes control of the government; this he will do after the passage of

Socialist bill. Austria has nearly completed the occupation of Bosnia and Herzegovina. Most of insurgents have been either killed, captured or they have fled into Servia, where they have been disarmed and interned. Now that it has taken Austria so long a time to suppress the insurrection of a part of the population of these pretty districts, people are more sensible of the difficulties which Turkey had to encounter in ruling these turbulent mountaineers. HERMAN.

The Queen of Italy is called the handsomest woman in Europe. The glories of a throne add wonderfully to the charms of a woman rightfully seated thereon!

INDUSTRIAL NOTES.

THE NEW CHALLENGE RAKE.

MESSRS. CLEGG, WOOD & CO. of Dayton, Ohio, in addition to their standard Archer Rake, exhibited at the New York State Fair a new Self-Dump, known as the Challenge Self-Operating Sulky Hay Rake, which attracted a great deal of attention. This Rake is made without either springs or ratchets; it has a divided axle with a gear wheel on each end at the center, which, being thrown up by a lever, engages a segmental gear hung excentrically, by which the rake head is turned and the load discharged automatically. In this Rake all springs, flat or spiral, are dispensed with. The wheels act independently, dumping from either or both. The teeth are independent, and can be held down while raking with scarcely a perceptible pressure of the foot. There have been a few of these Rakes made and operated this season, and as far as used they have met with an unparalleled success. It is the only geared Dump-Rake that we know of that dispenses with all springs and ratchets, and it is an implement that can be commended to the attention of our readers.

A CORRESPONDENT, writing from the Paris Exposition, says:—"The Jury on Musical Instruments, composed of many of the most celebrated European experts, and of which Dr. Franz Liszt is the Honorary President, were especially pleased with the magnificent display of the ESTEY ORGAN COMPANY. They repeatedly visited and tested their instruments, and made them the standard of excellence by which all others of their class were judged. The jury regretted that ESTEY & Co., who are by far the largest American exporters of Cabinet Organs, were *hors concours*, but it is the well-known policy of this house never to compete for prizes. Had they done so, there can be little doubt that another grand prize, or at least a gold medal, would have been added to the list of awards to the United States."—*N. Y. Tribune.*

THE HIGGANUM MFG. Co. of Hartford, Conn., have just made a new Cider Mill that is to be known as the Farmer's Favorite No. 3 It may be operated by two men or by power. Worked by hand it is said that it will grind forty-five bushels of apples per hour, while with power it will consume sixty bushels. Combined with the Mill is a press that will express seventy-five gallons at a pressing.

THE U. S. Wind Engine and Pump Co., Batavia, Ill., makers of the widely-known Halliday Windmill, have been the recipient of high honors at Paris, receiving the only medal given to windmills. We congratulate the Company on its honors.

THE MARKETS.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, Oct. 5, 1878.

BEANS AND PEAS.—New mediums and marrows have sold upon arrival, and the market for old is steady with good rates for prime. Red kidney have fallen rapidly in price, and close weak. Black beans dull. White kidney in light supply as yet; would bring quotations. New mediums, $1 60@1 75; old, $1 65@1 67½; new marrows, $1 75@1 80; old pea, $1 55½@1 60. new pea, $1 70@1 75; white kidney, $1 70@1 75; red kidneys have declined to a range of $1 75@$2 25; black beans, $2 nam'd. Green peas, $1 35; Southern B. E. peas, $2 50@2 75 per 2 bush. bag; Canadian peas in bulk and bond, 78@80c.

Receipts of beans, for week, 4,500 bush. Exports, 1,685 bbls.

BEESWAX.—Small lots have been taken at 27@27½c for Western and Southern.

BROOM CORN.—There are only moderate lots in stock. Sales of choice green hurl, 6@7c.; medium hurl, 5@6c.; choice short green, 5½@6½c.; medium short green, 5@6c.; red stubby and crooked, 5c.

BUTTER.—The market has ruled quiet and quotations have been tame during most of the week. A number of farmers here with dairies are quite surprised at the toneless condition of trade. If anybody expects a high range of prices this season he will be disappointed. Supplies are likely to exceed current wants, and, as the times are not apt to improve with cold weather, consumers will not support rates any more against them than the present. This, of course, refers to the bulk of the State crop; but even the vision of 30c. and upwards for fancy is daily growing dimmer.

Diminished export trade is a depressing feature of the market. Western dairy has a good market demand, that is, for the line of trade that makes butter a specialty. A larger business would follow Western if quality were more evenly good.

Comparative receipts and exports for past three years;

	Receipts, pkgs.	Exports firkins.
June 1st, '78 to October 1st, '78.....	554,675	130,866
June 1st, '77 to October 1st, '77.....	541,620	105,257
June 1st, '76 to October 1st, '76.....	482,600	61,785

Dairy, pails, choice, 22@23c.; fair to prime, 15@20c. poor, 1 @13c.; State, half tubs, choice, 21@3 c.; fair to prime, 17@21c.; poor, 13@14c.; entire dairies, 18@20c.; firkins, 16@18c.; Welsh, tubs, choice, 20@22c.; good to prime, 17@19c.; poor, 10@11c.; creamery, selected, 26c.; other, 23@25c.; Ohio and State, sweet, cream, 22@24c.; Western creamery, choice, 2c.; poor to prime, 19@22c.; Western dairy, choice, 17@18c.; other, 13@15c.; Western factory, ladle packed, 10@13c.; milled and common, 7@10c.

Receipts for week, 37,695 Exports, 7,326 pkgs.

CHEESE.—The stronger feeling which developed immediately, subsequent to the country sales, has been held well through the week. The feature again this week has been the almost exclusive inquiry for fancy lots; the late made lots closed with sales at 9¾@10. Early August and good and lower grades move off steady. Shipments for the week have been 52,659 boxes.

Quotations are 9¾@10c. for fancy late made; 7¾@8¾c. for good and prime; 6¾@7¾c. for fair to good; 5½@7c. for half-skimmed; 4@5¾c. for skimmed. State, farm dairy at 8@9c. for good to choice, 6½@8c for fair to good, and 3½@5½c. for poor skimmed. Wisconsin factory, fine to fancy, 9@9¾c.; do. good to prime, 7¾@8¾c.; do. fair to good, 6½@7¾c. Western factory firmer, and fancy, 8¾@9½c.; good and prime, 7¾@8¾c.; fair, 6@7c.; half skimmed, 5@6c.

Receipts for week, 92,561 boxes.
Gold closes at 100¼.
Liverpool cable quotation, 45s.

COTTON.—The crop movement has been way beyond expectations, and prices have had a pretty sharp set back, and closed weak. Latest prices are: for October, 10.35@10.36c.; November, 10.32c.; December, 10 32@10.33c.; January, 10.37@10.38c.; February, 10.40@10.45c.; March, 10.52@10.53c.; April, 10.61@10.62c.; May, 10.70@10.72c.; June, 10.77@10.78c.; July, 10.83@10.85c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

CIDER offered freely on wharf at 6@7c., large packages; small packages, pure sweet, 9@10c.

DOMESTIC FRUITS.—During the week apples took a rising movement, but the market has relapsed into weakness. Selected, red, $1.75@1.87, bbl.; mixed, western N. Y., $1.62@1.75; other, $1@1.37; open heads rejected. Cranberries in fair demand for prime ripe stock, Cape Cod, choice, $3@3.25, bbl.; other, $6@7; N. J., $6@7; do., crates, $1.50@2.25; L. I., sends some fine samples this season, selling above Capes. Pears are firm, and not in overstock. Seckels, choice, $10@12 bbl.; common, $6@9; Virgalieu, $3@7; other, fancy, $4@7; cooking, $2.50@3.50. Quinces, apple, $5@8.00, bbl; pear, $3@6.50. Grapes sell steadily; few Delawares this year. State Del., in 3 lb. boxes; $4@4.75 per case; loose, 8@9c. lb. Concord, State, cases, 3 lb. boxes, $2.75@3.25. Catawbas, lb., 6@7c.; Concord, 3@4½c.; Isabella, 4@5c. Watermelons closing at $15@25 per 100, for best remnants. California pears, $4@4 50 box; varieties, B. Clairgeau; Doyenne du Comice; B. d' Anjou. Muscat grapes, $4@5, per 40 lb. case; Tokay, $5@6. The crop prospect of peanuts is 800,000 bush. for Va.; 450,000 Tenn.; 90,000 N. C. Market fairly clear of old stock; hand-picked Va., $1.55@1.60; fancy, $1.45; other, $1.35@1 40. Chestnuts, for the moment, $8@9 bush. Shellbarks, $2@2.50.

Exports of apples, 9,250 bbls.

DRIED FRUITS.—In apples the business is still limited to the better grades of sliced, which bring full unchanged prices; quarters are not settled in price. Peeled peaches have eased off a little and closed steady. Small fruits are not changed.

New blackberries are quoted at 5½c. Peaches—Peeled, new Georgia, 6c. for poor, 7¾@8½c. for fair to good, and 9c. for prime; choice North Carolina, 10@11c.; good do., 8@9c.; unpeeled new halves, 3½c.; quarters, 3½@3¾c. Pitted cherries, 15@15½c.; southern plums, 11@12c. Apples—Old State quarters, 2¼@2¾c.; do., sliced, prime, 4c.; do., good, 3@3½c. New apples 2¾@3¼c. for Southern quarters in bbls.; 4½@5¼c. for prime sliced, and 6@7c. for fancy. New raspberries, 24@25c., and evaporated, 25@27c.

Exports past week 238 bbls. dried apples.

EGGS.—Receipts for week, 5,700 bbls.; do. last week, 4,839 do. Stock has sold out well with rather stiff prices. Choice limed have sold at better rates. N. J. and near points, 24c.; State and Penn., 22½@23c.; Western fresh, 21¾@22c.; Canadian, 21½@22c.; poor stock, 20c.; limed State, 17@18c.; Western, 16@17c.

HONEY.—Quiet at 15@17c., single-comb boxes; 13@14c., two do.; buckwheat, 10@12c.

FLOUR.—Prices have dropped further on large supplies, and the lower tendency of wheat.

Latest Sales are: $3.50@3.90 for poor to choice superfine State: $3.90@4.15 for poor to good extra do., odd lots and lines; $4.15@4.45 for good to choice do., strictly choice and fancy lots above this; $3.50@3.90 for very poor to fancy superfine Indiana, Iowa, Michigan, &c.; $3.90@4.15 for inferior to good shipping extra do. and $4.15@4.45 for good to choice extra do.; common to about choice white wheat extras, $4.40@5.15; choice to about fancy do. at $5.15@6.00; red and amber winter wheat, inferior to very choice trade and family at $4@5.50; round hoop Ohio at $4.00@4.25, and trade and family brands of do. at $4.25@5.50, the latter rate for very choice, (fancy lots quoted higher); St. Louis, $4.10@4.75 for very poor to good extra, and $4 75@6.00 for good to very fancy; Minnesota clear, very inferior to fancy at $4@5.75; Minnesota "straight," inferior to very choice at $5.@6 25 (some very fancy, including old, quoted above these figures, and patent fair to very fancy at $6.25@8 40; unsound stock at from $3@5 00; city mill extra at $5 00@5 15 for West Indies (the latter rate for strictly choice in new packages); do. for England, $3.90@4.00; do. trade and family extras, $5.50@6.00; do. for South America, $5.25@5 75 for fair to fancy; No. 2 at $2 70@3.85 for very inferior to very fancy, the latter an extreme.

CORN MEAL—Sales at $2 90@$2.95 for Brandywine, and $2.35@2.71 for yellow Western.

BUCKWHEAT FLOUR—Is offered lower. Sales at $1.75@2.10.

GRAIN.—Wheat has been in large receipt, the condition of the foreign markets generally unfavorable, and prices have been lower and closed easy.

Latest sales are of No. 1 red at $1.05½@1.06; ungraded white at $1.01½@1 08½; No 1 white, steamer grade, at $1.07; No 1 white, $1.08@1.08½; white State at $1.09; extra white at $1.10½; No. 2 white at $1.0 @1.08½; No. 3 white at $1 04½@1.05; No. 2 red at $1.05@1.05½; do. steamer grade at $1.03½@1.04; No. 2 amber, at $1.03½@1 04; ungraded amber at $1@1.05½; red Canada, in bond, at $1 01½@1 02; No. 2 Chicago spring at 85c.; No. 3 spring at 88@90c; New York No 2 spring, October option, at 96@96½c; do. November option, at 97½c.; No. 2 amber, October option, at $1 03½@1.04; do. delivery Oct 15 to 25th, at $1.01; do. November option, at $1.04½; No. 2 red, October option, at $1.05@1.05½; do. November option, at $1.06@1.06½; do. December option, at $1.07½; No. 1 white, deliveries in October, at $1 08@1.08½; do. first half of November; $1.08½; ungraded white, October delivery, at $1.07; and No. 1 red, delivery last half October, at $1 05½. Rye at 58c. for No. 2 Western and 61@64c. for State. Corn has been fairly active at easier prices; latest sales are of steamer mixed, at 48c; New York No. 3 at 47½c.; New York No 2 at 48½@48¾c.; ungraded mixed Western at 47½@49¼c; No. 2, October, at 48½@48¾c.; do. November, at 49½c.; do. December, at 50@50½c.; steamer mixed, October, at 48@48¼c.; do. November at 48½c Oats have been active and closed firm, including New York No. 2 white at 29½ 29¾c.; New York No. 3 white at 27½c.; New York No. 1 at 31½c.; New York No. 2 at 29@29½c.; New York No. 3 at 26½@26½c.; New York rejected at 25@25½c.; white Western at 27½@35c.; mixed Western at 25@32c.; white State at 28@35c.; mixed State at 27@32½c; New York extra white quoted at 37½@38c.; New York No. 1 white quoted at 35@36c.; No. 2 Chicago, October delivery, at 30½c.

HAY AND STRAW.—Prime lots of hay are wanted at steady prices; shipping grades are easier on full receipts.

Sales at 40@45c. for shipping, and 65@70c. for retail qualities. Straw quoted at 35@45c. for long rye; 50@35c. for short rye.

Exports for the week, 690 bales.

HOPS.—Mr. Emmet Wells says in his circular: "With more liberal receipts and a better assortment to choose from, exporters have been able to pick up some 400 bales of choice hops, and for these they have paid our highest quoted price. Brewers have also bought more freely, making a demand, on the whole, sufficient to take up nearly all of the floating stock of new. Business, no doubt, could be largely increased with more liberal arrivals, and without forcing it, for orders are here from abroad for choice hops. At Cooperstown and Waterville trade is reported very dull, 10 to 12 cents being all that buyers are willing to pay for a prime article.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, poor, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@8; Olds, all growth, 2@4.

POULTRY AND GAME.—Live chickens are easy; fowls, not in large supply, have brought fair rates. Roosters temporarily higher, owing to a Jewish ritual. Turkeys low. Ducks and geese unchanged.

Chickens, N. J. 13c. lb; State, 12½@13c.; Southern and Western, 12@13½c. Fowls—N. J., 13c.; State, 12½@13c.; Western, 12@12½c. Ducks, fat, ₱ pair, $1; poor to fair, 40@50. Geese, N. J. and Penn., $1.25@1.75; Southern and Western, $1@1.25.

Dressed poultry quoted about as before. Some lots turn out common and sell slowly.

Turkeys, dry picked, 14@15c.; other, 11@12c. Pa. chickens, 15@17c; N. J., 13@15c. State, 13@14c.; Western, 12@13c. Pa. dry picked fowls, 14@15c.; N. J., 13@14c.; poor to fair other, 10@12c. Ducks, extra, 1 @18c.; State, 13@14c.; poor, 10@12c. Geese, choice, 14@16c.; other, 8@ 2c.

The weather has been very unlike fall and game has ruled weak; most items lower.

Grouse, trapped, pair, 85@90c.; State partridges 70@75c.; Western, 50c. Woodcock, State, 60@65c.; Western, 45@50c.; English snipe $1.50 doz.; plover, $1.50; flight pigeons, $1.75@2; Mallard ducks, 50c. ₱ pair, common, 25@35c.

PROVISIONS have been unsettled and generally lower: Mess pork quoted at $870@8 90 for spot lots; $8 50@8 70 for October and November deliveries. Bacon at 6c. for long clear and 6¾ for short clear. Lard, western steam, at $6 70 for spot lots; $6 67½ for October; $6 65 for November, and $6 62½@6 65 for December. Tallow at 7c. for prime. Stearine at 7½ for Western. Beef Hams at $17@18. Beef—extra mess at $10 50@11; plain mess, $10@10.50; packet, $11@12 for bbls.; extra India $19@20 for city brands; do., Philadelphia, $18@19.

SEEDS.—Timothy is lower, and selling at $1.15. Clover at 7¾@7¾c. Flaxseed is lower; sales at $1.45@1.46.

TOBACCO.—Export demand continues brisk, and the market is in good shape. Quotations are for

Reading for the Young.

WHO DID IT?

Who tracked the mud across the floor,
And through the hall and up the stair?
And left it clinging to the chair?
Whose finger-prints deface the door?

Whose crumbs beneath the table lie?
Who smeared the butter on the cloth?
Who spilled the gravy, slopped the broth,
And dropped a pickle in the pie?

Who pulled the curtain with a jerk,
And left it hanging all askew,
And broke the cord?—'twas nearly new;
I wonder if 'twas mother's work?

Whose knife is this, with handle stained,
And open blade with rust so marred?
'Twas found this morning in the yard,
Upon the grass—last night it rained.

Just now I slipped and nearly fell—
A marble rolled a rod or more,
And then I crushed an apple-core—
Whose was it, mother? Can you tell?

Face downward on the slab, a book
Lies open, leaves dog-eared and thumbed.
And near, a handkerchief, begummed
And stiff with tally—only look!

Upon a door-knob hangs a hat—
'Tis passing strange it hangs at all;
And in the corner is a ball,
And on the sofa rests a bat.

I missed the hammer yesterday;
The hatchet vanished long ago;
All winter, underneath the snow,
Behind the house the shovel lay.

Are things bewitched? Do genii hide
Within my closets and my drawers,
And skulk behind the chamber doors,
And through the darkened attics glide?

I often go from room to room,
And sweep the floating cobwebs down,
And wonder when the spiders brown
Departed with their dainty loom—

But then—who knows?—those films so fine
May once have lain upon my shelf
Beneath the little bowl of delf;
'Twas there I used to keep my twine,

The tiny tacks I lost last spring—
A paper full, with polished heads
As black as jet and round as beads,
But deader than a mummie king—

What do you think they did to-day?
My sugar-bucket's sides they stormed,
And in the sugar-bucket fairly swarmed—
Who turned tacks into ants, tell me, pray?

The elves are in the house, 'tis clear;
I'd like to catch that one who took
The clothes-brush down from off the hook
And left it on the etagere.

Who was it, little Johnny Bell?
Why do you stand so shame-faced there,
And blush from chin to forehead fair?
I think you know the culprit well-
[*Mrs. E. D. Kendall, in August Wide Awake.*

THE CAT AND THE MOUSE IN PARTNERSHIP.

A CAT having made the acquaintance of a Mouse, told her so much of the great love and affection that he had for her, that the Mouse at last consented to live in the same house with the Cat, and to have their domestic affairs in common. "But we must provide for the winter," said the Cat, "or we shall be starved: you, little Mouse, cannot go anywhere, or you will meet with an accident." This advice was followed, and a pot was brought with some grease in it. However, when they had got it, they could not imagine where it should be put; at last, after a long consideration, the Cat said, "I know no better place to put it than in the church, for there no one dares to steal anything: we will set it beneath the organ, and not touch it till we really want it."

So the pot was put away in safety; but not a long while afterwards the Cat began to wish for it again, so he spoke to the Mouse, and said, "I have to tell you that I am asked by my aunt to stand godfather to a little son, white with brown marks, whom she has just brought into the world, and so I must go to the christening. Let me go out to-day, and do you stop at home and keep house."

"Certainly," answered the Mouse; "pray go; and if you eat anything nice, think of me. I would also willingly drink a little of the sweet red christening wine."

But it was all a story; for the Cat had no aunt, and had not been asked to stand godfather. He went straight to the church, crept up to the grease-pot, and licked it till he had eaten off the top; then he took a walk on the roofs of the houses in the town, thinking over his situation, and now and then stretching himself in the sun and stroking his whiskers as often as he thought of the pot of fat. When it was evening he went home again, and the Mouse said, "So you have come home at last: what a charming day you must have had!"

"Yes," answered the Cat; "it went off very well."

"What have you named the kitten?" asked the Mouse.

"*Top-off!*" said the Cat, very quickly.

"*Top-off!*" replied the Mouse: "that is a curious and remarkable name. Is it common in your family?"

"What does that matter?" said the Cat; "it is not worse than Crumb-stealer, as your children are called."

Not long afterwards the Cat felt the same longing as before, and said to the Mouse, "You must oblige me by taking care of the house once more by yourself; I am again asked to stand godfather, and, since the youngster has a white ring round his neck, I cannot get off the invitation." So the good little Mouse consented, and the Cat crept away behind the wall to the church again, and ate half the contents of the grease-pot. "Nothing tastes better than what one eats by one's-self," said he, quite contented with his day's work; and when he came home, the Mouse asked how this child was named.

"*Half-out*," answered the Cat.

"*Half-out!*" What do you mean? I never heard such a name before in my life: I will wager anything it is not in the calendar."

The Cat's mouth now began to water again at the recollection of the feasting. "All good things come in threes," said he to the Mouse. "I am again required to be godfather: this child is quite black, and has little white claws, but not a single white hair on his body; such a thing only happens once in two years, so pray excuse me this time."

"*Top-off! Half-out!*" answered the Mouse; "these are such curious names, they make me a bit suspicious."

"Ah!" replied the Cat, "there you sit in your gray coat and long tail, thinking nonsense. That comes of never going out."

The Mouse busied herself during the Cat's absence in putting the house in order, but meanwhile greedy Puss licked the grease-pot clean out. "When it is all done, one will rest in peace," thought he to himself, and as soon as night came he went home fat and tired. The Mouse, however, again asked what name the third child had received. "It will not please you any better," answered the Cat, "for he is called *All-out*."

"*All-out!*" exclaimed the Mouse; "well, that is certainly the most curious name by far. I have never yet seen it in print. *All-out!* What can that mean?" And, shaking her head, she rolled herself up and went to sleep.

After that nobody else asked the Cat to stand godfather; but the winter had arrived, and nothing more was to be picked up out-of-doors; so the Mouse bethought herself of their store of provision, and said, "Come, friend Cat, we will go to our grease-pot which we laid by; it will taste well now."

"Yes, indeed," said the Cat; "it will taste as well as if you stroked your tongue against the window."

So they set out on their journey; and when they arrived at the church the pot stood in its old place—but it was empty!

"Ah!" said the Mouse, "I see what has happened; now I know you are indeed a faithful friend. You have eaten the whole as you stood godfather; first *Top-off*, then *Half-out*, then——"

"Will you be quiet?" cried the Cat. "Not a word, or I'll eat you."

But the poor Mouse had "*All-out*" at her tongue's end, and had scarcely uttered it, when the Cat made a spring, seized her in his mouth, and swallowed her.

This happens every day in the world. GRIMM.

THREE BUNNIES' QUEER MAMMA.

A CURIOUS instance of the affection which the female of one species of animal sometimes exhibits for the young of a different species is reported by Mr. John Sinnott, of Lafayette, on the Norristown Railroad, as having come under his own observation. In his household is a cat, to which a week before a number of kittens were born. All the youngsters, except one that was to be kept, were drowned, in consequence of which Madame Pussy appeared sad, mewing and purring her bereavement and displaying increased love for her only living child. The couch of pussy and the little ones was in the cellar, where, at noon, on the day after the drowning, Mrs. Sinnott was surprised to find three tiny animals lying close together. They were all about the same size, but two of them differed somewhat in shape from the third, having ears considerably longer—much too long to be those of a kitten. Pussy was not about, but while the lady was examining the little creatures the old cat came in, carrying by the nape of its neck, between her teeth, another tiny quadruped with long ears. Pussy deposited her burden with the three other little things, lay down beside them, and tenderly caressed them, one at a time. In the evening, when Mr. Sinnott came home, he saw the quartette vigorously drawing the staff of their life from the breast of patient Pussy, who seemed no less a mother to one than to any other. He soon ascertained that the three new additions to the feline family were baby rabbits. In order to give them more agreeable quarters he removed the five to an out-house. But thenceforward Madame Pussy seemed to be without affection for her adopted children. Evidently she discovered that she had made a mistake and was doing wrong. She no more gave them suck nor caressed them, but devoted undivided attention to her natural offspring. Mr. Sinnott's family then took charge of the deserted bunnies, giving them sweet milk and keeping them warm, but despite the best of human care, they lived but a day or two afterward.

A NEW GAME FOR CHILDREN.

THE juveniles have a new game called "Blind Man's Mockery," out of which they are getting lots of amusement. One of the party is blindfolded, and while he is counting twenty-five the others range themselves as miscellaneously as possible in a row, and hold out their hands. The "blind man" slaps somebody's hands, at the same time inquiring, "Who are you?" The youngster slapped rather impolitely replies, "None of your business," and the "blind man" is obliged to guess his name from the sound of his voice. He can guess but once, and, if he fails, must try some one else until he guesses right, when the one whom he detects becomes "the man." The game depends upon quickness of ear, as well as upon the ability to disguise the voice, and it shows a wonderful difference in children in both respects.

Sabbath Reading.

THE TRIAL OF JESUS CHRIST.

That the whole council did not meet at night is unquestionable: that a certain number of them were present by night with Caiaphas is equally clear. Assuming that there was a final and formal meeting of the whole Sanhedrim at its usual morning hour, it is barely possible that the vivid scene of the adjuration, confession, and sentence took place before it. But it is much more likely on the evidence that it took place earlier, when a considerable number, quite enough to be popularly called a council, were already assembled. And, in any case, it is certain that that still earlier transaction—the examination of witnesses and the deliberation on their evidence—must have taken place some time during the night. The confusion of representation is quite natural. For, according to all the rules of Hebrew law, such a transaction in the night was absolutely illegal, incapable of being validly transacted in either form, and incapable of being reported so as to produce an impression of justice upon the minds of the people.

The law is laid down in a passage of the Mishna, which contrasts capital trials with questions of money.

The former (money trials) are commenced only in the daytime, but may be concluded after nightfall: the latter (capital trials) are commenced only in the daytime, and must also be concluded during the day. The former may be concluded by acquittal or condemnation on the day on which they have begun: the latter may be concluded on that day if there is a sentence of acquittal, but must be postponed to a second day if there is to be a condemnation. And for this reason capital trials are not held on the day before a Sabbath or a feast day.

The crucifixion of Jesus took place, as has scarcely ever been doubted, on the Friday, the day before a Sabbath which was also "an high day;" and the meeting of the council took place on the same Friday morning. Such a meeting on such a day was forbidden. If indeed it only met to register an acquittal, it was lawful. But if the court was unable at once to acquit, it was bound to adjourn for at least four-and-twenty hours before meeting for final judgment, and such a final meeting could not be on the Sabbath. The necessity of the adjournment of a capital trial to secure the rights of the accused is shown very clearly by the detailed regulations of the Mishna:

"If a man is found innocent, the court absolves him. But if not, his judgment is put off to the following day. Meantime the judges meet together, and eating little meat, and drinking no wine during that whole day, they confer upon the cause. On the following morning they return into court [and vote over again, with the like precaution as before]. If judgment is at last pronounced, they bring out the man sentenced, to stone him."

These regulations, taken not from the commentary on the oral law, but from the Mishna itself, probably existed in full detail during the high-priesthood of Caiaphas. There is no reason to doubt that at least the general rule, which prescribes adjourning the trial from one day to another, bound the judges of Jesus of Nazareth. In no case was such a rule so absolutely necessary to justice, as where the accused, arrested after nightfall, had been put upon his trial by daybreak, without the least opportunity of summoning witnesses for his defence. But what the Gemara describes as the *atrocity* of thus anticipating the day of death of the accused, was exceeded in open injustice by the earlier outrage of commencing, and probably substantially concluding, the real trial under cloud of night. That would have been an intolerable scandal even in the case of an ordinary civil suit.

Yet there can be no doubt that at some untimely hour, between Thursday night and Friday morning, the form and somewhat more than the form, of a trial by Hebrew law did take place. The judges, unjust as they were, were men trained in that law of minute scruples and mighty sanctions; and they would have felt it impossible to dispense with process and form altogether. Meantime much was going on. The members of the council present sought for witnesses against Jesus. Matthew says they sought for false witnesses. But even the former was a scandalous indecorum. Hebrew judges, as we have seen, were eminently counsel for the accused. And one of the strangest sights the world has ever seen must have been the adjuration or solemn address to the witnesses who came to speak against the life of Jesus, by the magistrate who had—no doubt with perfect sincerity—held it expedient that one man should die for the people. That form of adjuration or solemn appeal still exists in the body of the law. It was the duty of the high priest to pronounce it to each witness in a capital case, and so to put them on oath. Who can measure the effect of its utterance by the sacred judge of Israel upon men who while the words were uttered, were forced to gaze into the face of him whose life it guarded?

"Forget not, O witness, that it is one thing to give evidence in a trial as to money, and another in a trial for life. In a money suit, if thy witness-bearing shall do wrong, money may repair that wrong. But in this trial for life, if thou sinnest, the blood of the accused, and the blood of his seed to the end of time, shall be imputed unto thee. Therefore was Adam created one man and alone, to teach thee, that if any witness shall destroy one soul out of Israel, he is held by the Scripture to be as if he had destroyed the world; and he who saves one such soul to be as if he had saved the world."

The Son of Man whose life was surrounded by the law with this tremendous sanction stood silent before those witnesses; and, whatever was the reason, their testimony was found ineffectual. What was the Hebrew law of evidence? The Talmud divides all oral evidence into—

1. A vain testimony.
2. A standing testimony.
3. An adequate testimony; or (perhaps) the testimony of them that agree together.

The evidence of the earlier witnesses who on that night were examined seems to have been set aside as belonging to the first class; for a "vain testimony" was not even accepted provisionally, or retained until afterwards confirmed. A "standing testimony" on the other hand, was admitted in the meantime and provisionally, but not held valid until confirmed by others. To this intermediate rank attained the evidence of that witness who at length came forward to speak to the early utterance of Jesus about the destruction and rebuilding of the temple. And when following him another came, the question was at once raised whether the testimony of both did not amount to the third and complete order of evidence, known as "the testimony of them that agree together." "But neither so," says Mark, using the exact technical term, "neither so did their witnesses agree together." This may undoubtedly have been a mere discrepancy in their narration of facts. That discrepancy cannot have been great, according to our modern ideas. For Mark gives the evidence of both in one indiscriminate sentence. And Matthew does the same in another sentence, slightly different. Neither of them makes any explicit distinction between what the two witnesses said. Let us suppose that the discrepancy between the two (alleged by Mark) amounted only to this, that the one said, in Matthew's phrase, "I am able to destroy the temple of God," and the other, "I *will* destroy this temple." It is by no means clear that even such a difference as this might not have been sufficient to nullify their testimony. For in a Hebrew criminal trial "the least discordance between the evidence of the witnesses was held to destroy its value;" and this rule, like others, was pushed to that childish extreme which we now call Judaical. A mere verbal distinction may have sometimes been a fatal objection in the mind of even such a judge as Caiaphas. But the evidence of men who are not reported to have said anything extreme, but whom the Evangelists, departing from their usual reserve, distinctly call "false witnesses," was probably reckless and inaccurate. And it is just possible that the variation between the reports of the two Evangelists covers not a mere verbal distinction, but a substantial and serious difficulty, of great importance for the conduct of the case.

For at this point we are confronted by one of the most important questions in the whole inquiry, What was the crime for which Jesus was all this time being tried? What was the charge, what the indictment, upon which he stood before the council? Up to this point we have had no intimation on that subject. In modern times that would be an extraordinary state of matters. But we must not judge Jewish law, or indeed early law of any nation, by our modern rules. Hebrew law, as we have seen, gave a peculiarly important position to the witnesses. I believe we shall not fully realize that position unless we remember that, at least in the earlier days of that law, the evidence of the leading witnesses constituted the charge. There was no other charge: no more formal indictment. Until they spoke, and spoke in the public assembly, the prisoner was scarcely an accused man. When they spoke, and the evidence of the two agreed together, it formed the legal charge, libel or indictment, as well as the evidence for its truth. This, to us paradoxical, but really simple and natural origin of a Hebrew criminal process, is nowhere better illustrated than in that ancient *cause celebre* of Naboth the Jezreelite. "They proclaimed a fast, and set Naboth on high among the people. And there came in two men, children of Belial, and sat before him; and the men of Belial witnessed against him, even against Naboth, in the presence of the people, saying, Naboth did blaspheme God and the king. Then they carried him forth out of the city, and stoned him with stones that he died."

The essential points of a Hebrew trial for life are here given with admirable terseness. But in the case of Naboth the false witnesses suborned by the Sidonian queen are represented as using the technical word, of blasphemy. In the trial of Jesus, the only witnesses distinctly spoken to reported a particular utterance of the accused. What crime was this utterance intended by the accusers, or the judges, to infer? There are two distinct meanings which may have been innuendoed. According to one of them, the words "I will destroy this temple that is made with hands, and within three days I will build another made without hands," may have been represented as the voice of one come to attack the existing institutions—to "destroy the law and the prophets." We have a most important commentary on this in the parallel accusation of Stephen a few months later: "We have heard him say, that this Jesus of Nazareth shall destroy this place, and shall change the customs which Moses delivered us." But according to another view, the same reported utterance—especially in the modified form of Matthew, "I am able to destroy the temple of God"—may have been intended as a charge of arrogating superhuman power. So his original auditors felt it. "Forty-and-six years was this temple in building, and wilt thou rear it again in three days?" The two charges, it will be observed, though very distinct, are not inconsistent. May he not have been charged both with attempting to change the national institutions and with pretensions to miraculous power? The difficulty in this supposition is that we have been seeking in these charges for the one crime upon which Jesus was finally condemned. But if we look more narrowly at the supposed difficulty, we may find what we have been seeking.—[Concluded next week.

PERSONAL ITEMS.

Wendell Phillips' recollections of his childhood are said to be very vivid. He is still thinking of the lost (t)arts.

Tennyson and Victor Hugo lickle each other about their poetry. Their love letters are frequent—another Mutual Admiration Society!

Senator Thurman has accepted the invitation to visit the State Fair at Macon, Ga., and will speak there October 18th, if sufficiently recovered from his present illness.

Captain Eads has declined the invitation of Dom Pedro to superintend the river improvements in Brazil, and has recommended a prominent American engineer in his stead.

One guillotine executioner, Roch, called "Monseigneur de Paris," suffices, with his assistants, for all Franco. He gets 8,000 francs a year and 100 francs for each head cut off.

THEODORE TILTON who has just returned from Europe, left his daughters, Alice and Florence, to finish their studies in Germany, the one being devoted to painting and the other to music.

Stanley, the heroic African explorer, is to deliver a hundred lectures in the large provincial towns of England. Past experience shows him to be a much better explorer than lecturer.

Ouray, the Ute Indian Chief in Colorado, cultivates a farm of sixty acres, has a house built and furnished in civilized fashion, drives one of the best teams in the West, and lives in a good style generally.

Captain Henry Allen, of Salem, Mass., has a pear tree 239 years old in his garden. Next to the Endicott pear tree it is probably the oldest in the country. It has borne several bushels of fruit this year.

Alexander Stephens is out of bed and the guest of Robert Toombs of Washington, Ga., so that the newspaper folks have to pigeon-hole, for the two-hundreth time, their obituary notices of the little Georgian statesman.

Mr. Joseph Taylor and his wife, the father and mother of our Minister to Berlin, will celebrate their diamond wedding on the 18th of October at Cedarcroft. Now where's Cedarcroft? The P. O. Guide says nothing about it.

Mr. and Mrs. Robinson of Mountain City, Texas, have lived together eighty-two years. He is 103 and she 102. It is the Browns, Joneses and Robinsons, not forgetting the Smiths, who have given the most praiseworthy lessons to the English-speaking people.

Senator Thos. A. Bayard lives in the country, near Wilmington, in the house where Mrs. Myra Clark, now Mrs. Gen. Gaines, the celebrated litigant, was brought up. Not unlikely she'll lay claim to that when she has secured all New Orleans, St. Louis, Cincinnati, and half-a-dozen other towns.

Mrs. Stillman Alden has just died in Ludlow, Mass., at the age of 82 years. During her married life of sixty-six years she and her husband were not under different roofs for a single night. A model wife that, who could make home so pleasant in the evenings!

Florence, the actor, has a scrap-book to which he is much attached. He says: "This book saved my life once. There was a railway accident out in Ohio. I might have been killed if I had gone on that train. I didn't go. I stayed at home reading this scrap-book." There's a puff gratis!

Some suppose that Cronin, Tilden's purchased Elector from Oregon, has been entirely burnt out by his unfortunate nose; others fancy that he has hired himself to the government as a cheap lighthouse, but all such surmise is wrong, for Mr. Cronin is living the life of a bloated bondholder and a lop-eared pelican, at Astoria, in the Far Northwest.

Dom Pedro, Emperor of Brazil, was a student and friend of the poet Coleridge, and holds his memory in tender recollection. When last in England he visited Coleridge's tomb one morning as early as 9 o'clock. He has lately sent a silver vase, as a tribute of regard, to Mr. Thomas Allsop, the oldest living personal companion of the great master.

Miss Florence Nightingale, who first gained celebrity as a nurse of wounded soldiers during the Crimean war, is now sixty years old, and lives in London almost a prisoner in her room, so ill is she. Once a year she takes her widowed mother to Derbyshire. She wrote lately in a letter to a friend: "Overworked as I am, my health is necessarily bad. Thank God, who still gives me work to do for Him."

Maryland has a sensation. Rear Admiral Worden, hero of the fight between the Monitor and Merrimac, and late Superintendent of the Naval Academy, finds himself acting the part of defendant in a suit for damages for defamation. Professor Bernard Maurice, who wants the $20,000, says that he has been maligned by Admiral Worden. There is a young woman in the case. Particulars to be guessed at.

IN view of the recent death of the Imperial Prince and the failure of the direct line of succession, the Emperor of Japan has adopted Prince Sawe-no-miya, a fine intelligent boy of twelve, eldest son of H. I. H. Azisugawa no-miya, as his son and heir, and presented him with the ceremonial robe at the Imperial Palace, in the presence of the Empress, Empress Dowager and others of the Imperial family.

Victor Emanuel was a man extremely careless in dress. When about to visit Berlin, his chamberlain reminded him that he must have some new clothes. "Order them," said the king. "But your Majesty must give your measure, because they are very elegant at the Court of Berlin." "What a nuisance!" said sturdy royalty. "Count B—— is just my size. Ask him to do me the pleasure to give his measure."

Mr. Spurgeon has changed greatly in the past twenty years, having become broad and thickset. His heavy brown hair, with beard and whiskers surrounding his face, gives him the appearance of an English sea-captain rather than that of one of the most noted clergyman of England. He never had much of a clerical look, and has less now than over. When he comes on the rostrum—for he has no pulpit—he looks more like the sexton arranging the books for the pastor than like the great preacher himself.

Senator Butler of South Carolina, who is traveling with the Presidential party, unconsciously perpetrated a good joke during his visit to Minnesota. On one occasion a person on introduction inquired: "Are you the man who killed so many people in South Carolina?" Mr. Butler, without betraying annoyance, pleasantly replied: "I presume you have killed more men than I have." He was unaware that he had got ahead of his questioner, until a hearty laugh from the by-standers suggested an inquiry as to the cause, when he was informed that the man was a doctor.

Prince Albert Victor, the eldest son of the Prince of Wales, a boy with an erect figure and a heavy face, is to enter a military academy by-and-by. When he is seventeen he will go into the army, and, it is said, is not unlikely to emulate the example of his soldier-like uncle, the Duke of Connaught, and undertake at first the most subordinate duties. Prince George of Wales is to adopt the naval profession. Highly interesting to learn how these dear children are to earn their bread!

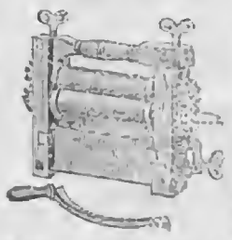
Laura Bridgman, who has been before the public for more than forty years, and whom Dr. Howe introduced to general notice by teaching her, though a blind, deaf-mute, to spell and read in a few months, and afterward to write and play skillfully on the piano, is now nearly 50, and has redeemed all the expectations formed of her childhood. She has a good general education, including many advanced studies; she writes well, and has many mental resources. She sews exeellently; is acquainted with domestic duties; communicates freely with her friends, and enjoys life keenly.

The man who, but for revolution, would now be Tycoon of Japan, is a student in Paris, living quietly as M. Tokugawa. He is small, lithe and well-dressed. His income is $200,000 a year, of which he spends a little on himself and sends the remainder to his followers who were ruined by the revolution. Very few of his fellow students know who he is. He will learn all he can at the University of Paris, and will then go to London to continue his studies. Eleven years ago, when the Japanese Embassy went to London, he, then a little boy, headed it, as brother of the Tycoon, and the Prince of Wales went to Dover to welcome him.

Dean Stanley, the celebrated English leader of the "Broad Church" party and Dean of Westminster, now on a visit to this country, stands perfectly still when he preaches, making no gestures, though he speaks impressively. One Sunday after returning from church he asked his wife why people looked so intently at him during the service. She replied: "How could they help it, dear, when one of your gloves was on the top of your head all the time?" It had dropped from his hat. He is a rather magnificent-looking person with a slightly built and stooping figure, neatly cut gray hair and whiskers of the old English style, a face expressively full of pleasant intelligence and dignity, and a voice not powerful, but distinct.

Implements and Machinery.

Keystone Wringer



Has Greater Capacity, Is More Durable, and Is better finished Than any other wringer now made.

THE ROLLS

Are made of White Rubber clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber is *vulcanized upon the shaft and cannot be taken off except by cutting it off*. They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

ASK YOUR DEALER for the KEYSTONE WRINGER

FOR SALE.—ONE OF H. J. CORCORAN'S celebrated Self-Regulating Wind Mills, with Pump. Diameter 16 feet; Horse Power 2½. It ha never been put up; will be sold cheap, as it wa taken for debt. ROBERT SEAMAN & CO., 52 Murray St., New York.

OSBORN'S PATENT
GRAIN AND SEED SEPARATOR.

We guarantee this machine to Clean, Separate and Grade, Wheat, Barley, Oats, Rye, Timothy, Clover and Flax Seed.

These machines have invariably taken the First Premium at every Town, County & State Fair wherever exhibited, including the St. Louis Fairs of 1874 and '75, and were awarded the Grand Gold Medal at the great Kansas City Exp'n in 1875, for the best invention in Agricultural Implements.

GRAIN DRILL.
Improved for 1878.

Farmers who are now, or who are contemplating sowing fertilizers, or any kind of artificial manures, should see our **Improved Grain Drill** with

FERTILIZER

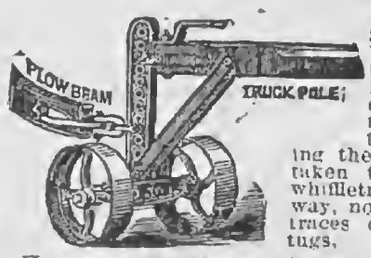
ATTACHMENT. It is positively the only device ever made that will sow any and all kinds of fertilizers. It has never failed in six years to give entire satisfaction. We warrant it fully. Send for full Illustrated Circular and Price List to the Manufacturers.

P. P. MAST & CO.,
SPRINGFIELD, OHIO.

PRINDLE STEAMER. Still ahead. Just the thing to utilize the waste product of a farm. Steaming removes poison from decayed vegetables. Price reduced. Illustrated Catalogues free. BARROWS SAVERY CO. Limited, S. Front & Reed Sts., or 614-616 Market St., Philadelphia.

IMMENSE SUCCESS.

The HARRIS Farm Truck!



Saves the Gage Wheel, half the labor of holding, 12 to 15 per cent. of the draft, team can back the plow, no riding the beam, plow taken to the field, whiffletrees out of the way, no stepping over traces or letting out tugs.

Harrows draw level, turn shorter, do ¼ more work. Holds Shovel Plow, prevents jumping and dodging. Gin Scraper saves man and team. Handles never get muddy. Will pay its cost in one week.

Just the thing on Stone Boat, Horse Fork, etc., etc.

Hon. Harris Lewis, Pres. N. Y. D. A., says: "The best farm implement for the money, he ever owned."

Prof. Arnold, Sec. A. D. A., says: "It will be considered an indispensable addition to the list of farm implements when once tried."

Hon. T. F. Randolph, U. S. Sen. from N. J., says: "It is desirable because of its simplicity, effectiveness and economy."

Great inducements to one responsible Canvasser or Agricultural Dealer in each town.

Wit and Humor.

Dog days. Don't you hear 'em bark.

LEAVES have their time to fall, and fall is the time.

BAY windows are safe harbors at night for little smacks.

"THE Afghan" is not exactly "all the rage" in England, but it is the cause of a good deal of it.—*N. Y. Mail.*

NOTHING tries the patience of a man more than to be sitting on a sofa in a dark room with a pretty girl, and be compelled to listen to her brother giving the history of a base-ball club.—*Puck.*

A LITTLE girl asked a minister, "Do you think my father will go to heaven?" "Why, yes, my child. Why do you ask?" "Well, because, if he don't have his own way there he won't stay long."

HERE'S the way a New Hampshire exchange tells it: Ex-Governor Miller of Minnesota is delivering a lecture in that State which is entitled "All Men Are Liars." His tickets read, "All Men Are Liars—admit one." [*N. Y. Commercial Advertiser.*

"Do you call that clothes?" said sternly a British customs official to the woman who had sworn that there was nothing in her trunk but clothes for herself and husband; and as he spoke he pointed to six bottles of brandy. "Yes," said she softly, "those are night-caps."

THE French actor who was taking the part of Major-General in a play, slipped and fell the very moment he was supposed to be leading his troops to battle. With ready wit he avoided the ridicule of his audience by exclaiming, "Soldiers, I am mortally wounded, but do not stay to aid me. Pass over my prostrate body to victory."

"Now, then, madame, please look steadily at this place on the wall," said a photographer to an old lady, when he had put her in position and the plate in the camera. The old lady looked hard at the spot indicated, then got up and walked across the floor and minutely inspected it, and then, turning to the photographer, gently remarked, "I don't see anything there."

LITTLE Gracie was dressed one day in the whitest of dresses, when, being left alone, she began to investigate a coal hod, getting inside and as black as possible. When her mother came back, she, seeing her look of amazement, dropped on her knees, put her little chubby black hands together before her face and said, "O, Lord, give us patience"—and he did. At least Gracie got off easily that time.

A Health-Destroying Vapor

Is generated by the action of the sun's rays upon damp decaying vegetation, stagnant pools, and marshy, low lying tracts. The true nature of this miasma is by no means clearly understood, but there are two facts in relation to it that are. The first is, that the periodical fevers which it breeds are of the most virulent type; the second is, that these maladies are rarely cured, although they may be ameliorated, by the ordinary remedies employed to overcome them. The true antidote to the effects of miasma is Hostetter's Stomach Bitters. This medicine is one of the most popular remedies of an age of successful proprietary specifics, and is in immense demand wherever on this continent fever and ague exists. A wine-glassful three times a day is the best possible preparative for encountering a malarious atmosphere, regulating the liver, and invigorating the stomach.

Farm Topics.

AN EASY METHOD OF IMPROVING THE VALUE OF SOME FARMS.

Farm life is prosaic. Yes, in spite of all graceful allusions to Arcadia and its employments, made by poets of bucolic fancies, this is a fact. The women of the house have their bit of color in a few flowers about the porch or in the garden, but life is supposed to be too practical and money too hard to get, to permit much expenditure on mere delights of the eye. Of course, notable exceptions to this rule exist, but it remains true, nevertheless, that a farmer will buy books of all sorts, on poetry and art even, before he will do landscape gardening of any sort beyond planting street trees. Nor is it to be wondered at; for, in the eyes of the inexperienced, the outlay must bear but a poor relation to the returns. Let us see how far this is true.

The graceful grouping of woods and water, in the accompanying picture, has suggested to us one way, at least, in which the farmer may profitably indulge in landscape gardening. In the picture we present a beautiful feature of a country seat in England, reproduced from the London Gardeners' Chronicle; but did it ever occur to any one that a similar effect might be produced with moderate expense, on very many farms throughout America. Given a low spot and a spring in an ordinary pasture lot, a small dam, and a few trees and shrubs, easily purchased or procured from the woods, and in a few years the scene of the picture will be ours. No digging or grading would, as a general thing, be necessary, for all inequalities disappear beneath the water, and above on the shores, the more irregular the surface, the more picturesque the appearance of the planting. As in the picture, reeds, yuccas and certain appropriate grasses may be naturally and effectively disposed along the margin and, here and there, flowering shrubs may be clustered on some prominent curve of the shore. The peculiarity of such plantations is that they increase the apparent size of the pond or lake. The eye wanders from one pleasing object to another, and thus fails to realize the smallness of the sheet of water they surround. Ordinarily the monotony of an expanse of water creates a false impression of its area, but well managed planting on its shores will keep opening up to the eye little bays and unexpected reaches of water, suggestive of increased size.

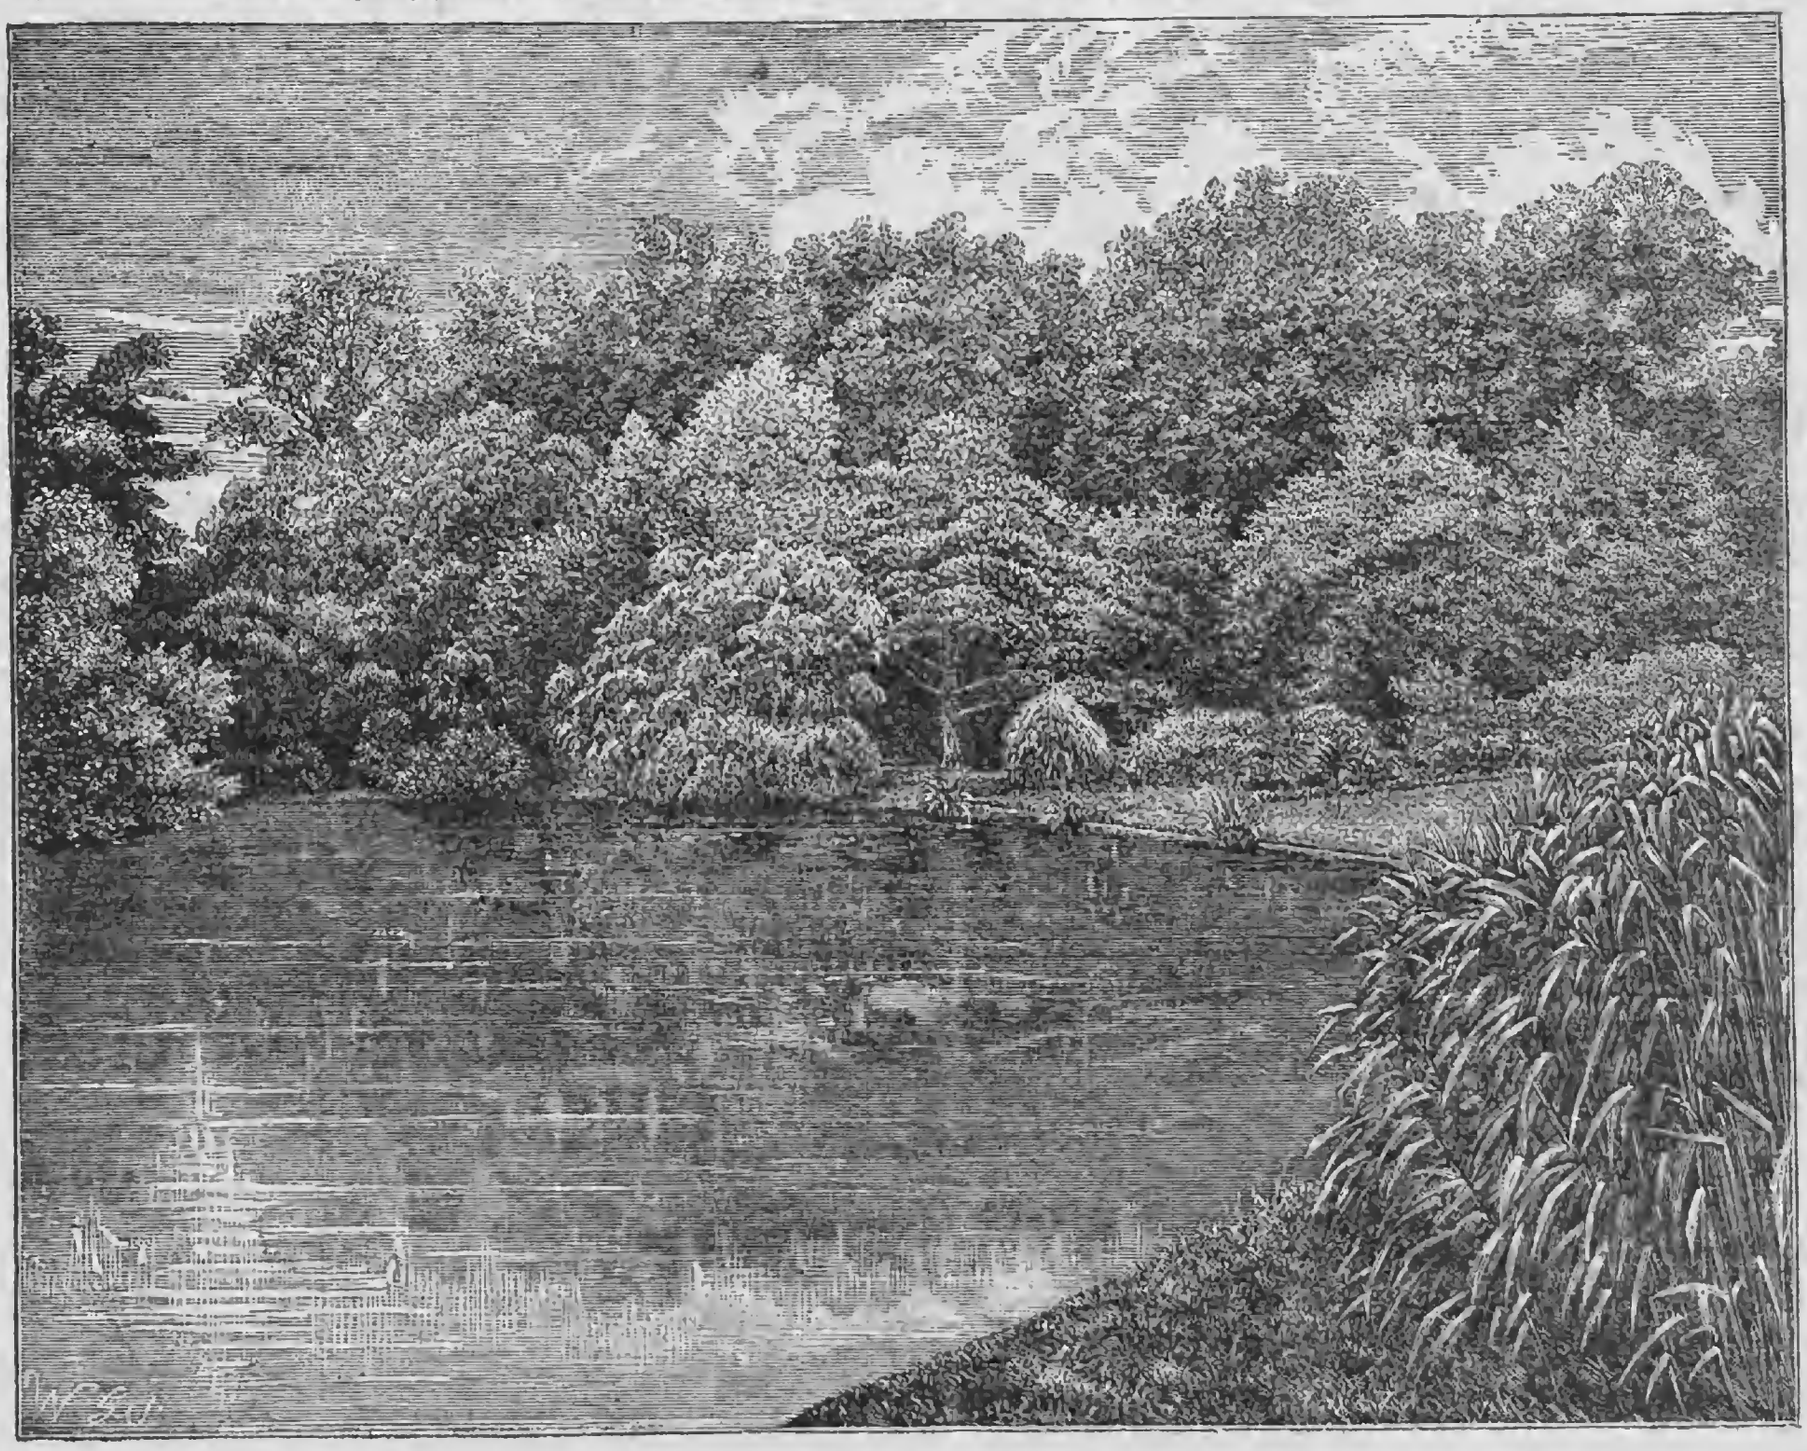
It is customary to plant Willows on the edge of streams or ponds, but though they are picturesque and appropriate, the tree itself is not long-lived, and should therefore be used sparingly. In our picture we find a mass of foliage clustered entirely on one side of the pond which may occupy two acres in extent. This arrangement is well advised, for it leaves plenty of shore open for effect, and at the same time gives solid masses of foliage for shade, etc. As a rule, plenty of foliage should also be clustered about both sides of the dam. The most picturesque effect can be produced at this point, and here, therefore, we may use the choicest trees. A Weeping Beech may droop over the water, relieved by a dark-purple Beech in the immediate neighborhood. Here also may be planted the Salix laurifolia (or pentandra), with shining green leaves and yellow twigs. This Willow, as we have said, is too little known; for it not only lasts long and does well in low places, but is equally thrifty on light, sandy soils. The value of its foliage, as a contrast with that of other trees, cannot be overestimated. Deciduous trees thrive better than evergreens in low places, and in the picture we have before us, it will be seen that this fact is kept in view.

Space will not permit us to study properly the special trees and shrubs that should make up the grouping about a pond, but no better example can be followed than may be found any day on some natural pool in a woodland glade. We find here and there, on curves of shore, shrubs and low-growing trees, backed up by larger growths of Liquidambar, Scarlet Maple, Pepperidge, and sundry Oaks and Dogwoods. Such a plantation will make a truly natural bit of scenery in the midst of pasture land, and here also cattle may drink or repose themselves in the grateful shade. Wild flowers may be planted under the trees; that is, if they do not come spontaneously, and thus with flowers, and the tints of summer and fall leaves, the picture will be always pleasing. Nor should climbing vines be forgotten, to give the finishing touch to the natural effect of the scene. A little care of the trees and the margins of the pond will suffice to keep the place in good shape.

In return for this outlay and care, the farmer has in his field a beautiful object which is more pleasing in a dozen ways than the unattractive, muddy puddle that originally occupied the spot. Moreover, ducks and geese can disport themselves in such bodies of water, and successful attempts be made to breed fish in their secluded recesses. The entire cost of the construction of such a lakelet—trees, planting and all—will scarcely amount to two hundred dollars, if proper taste and ingenuity be exerted; and if it cost five hundred or a thousand dollars, who would begrudge the expenditure? If we would only develop the enjoyable features of farm life, no one could term it dull or prosaic.

VALUE OF A SPRING.

We know of a farm in which a single spring, which for many years seemed only to make a [illegible]dy, unhealthy area of half an acre, was converted into a body of pure water at an expense of less than $250. The banks are now planted with various trees and the improvement is thought by unprejudiced persons to add several thousands of dollars to the value of the farm.



FARM LAKES.

NOTES FROM THE RURAL GROUNDS.

MOISTURE-RETAINING POWER OF SOILS.

Facts which seem to Controvert the long-cherished Theories of Agricultural Philosophers.

"Stir the Soil"—"Scarify it"—"Loosen it"—"Pulverize it"—"The capillary tubes are thus disconnected, and the moisture of the soil beneath the stirred surface, is preserved"—"It acts as a mulch"—"It is the farmer's best method of protecting his crops during seasons of drought," etc., etc.

Such teachings on the part of the agricultural press have been universal, and the advice has been deemed of such importance that it could not be too often or too firmly impressed upon the minds of all whom it was supposed to concern.

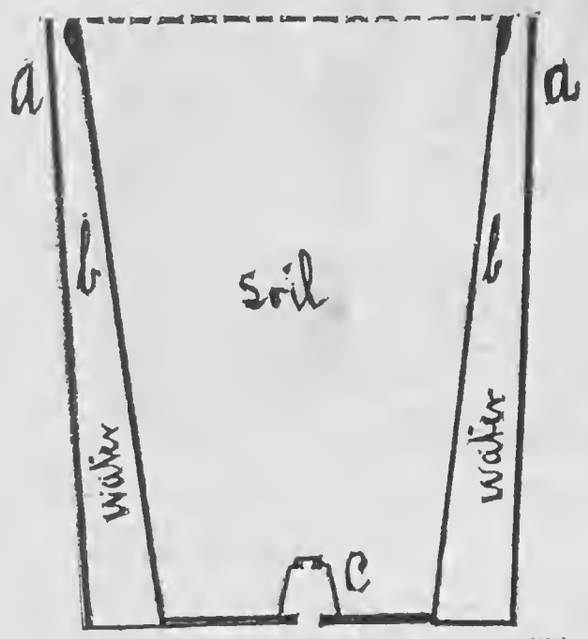
From experiments which we have been conducting for the past three years, we have been forced to the conclusion that this advice is entirely erroneous—wrong in theory—wrong in practice. Stirring the soil *does not* disconnect the capillary tubes—does *not* act as a mulch; does not preserve the moisture either in seasons of droughts or in any other seasons, and that consequently, in so far as *this* principle is concerned, the incalculable amount of labor performed to this end, has not only been performed to no purpose, but to the accomplishment of results precisely the reverse of those intended.

Three years ago we made our first experiments in this matter. But they were made to ascertain the different capillary powers of soils of different degrees of compactness—not with a view to test whether there was or was not the supposed advantage to be derived from loosening—pulverizing the soil. That was taken for granted. No suspicion of its entire soundness was entertained. An inkling of what we now believe to be the truth was, however, first obtained at that time, and it has been upon this clew that, as occasion has permitted, we have since endeavored to trace out the conclusions to which it might legitimately lead.

Supposing that our main conclusion be true, we have to regret that we have not as yet been able to work out the corollaries derivable therefrom. But another year at least, as the writer is situated, would be required for this purpose; and, as we have already stated the upshot of our main conclusion to a number of friends,* we have thought it advis-

* We may mention Professor Beal, of the Mich. Ag. College; Mr. Libby, of the American Agriculturist, and Mr. Lyons, of the N. Y. Atlas.

able to publish all that we have thus far ascertained, so that other and wiser experimenters may give the subject the consideration it may be thought to deserve.



The diagram represents an earthen pot within a wooden pail, both of which are cut in two, perpendicularly;—*a*, *a*, are the sides of the pail, which are nearly perpendicular;—*b*, *b*, the space between the pail and the pot;—*c* is a thumb-pot which covers the drain-hole, while the drain-hole of the thumb-pot is covered by a small piece of crock, as shown.

Three, sometimes four, of these contrivances were used in the experiments. It answers the present purpose, however, to speak of but three. A sufficient quantity of *loam* (we mean a soil composed of about half clay and half sand,) was sifted through a fine sieve, and then thoroughly dried in the oven. Pot No. 1, was filled with this loam, and packed as hard as it well could be packed with the hand, up to one-and-a-half inch of the top of the pot. This space was filled with the same earth, as loosely as possible; that is, it was simply sifted in, and the surface smoothed off to a level with the rim of the pot.

Pot No. 2 was filled and the loam pressed down as hard as possible with the hand, up to the top and smoothed off as in No. 1.

Pot No. 3 was filled in as loosely as possible from the bottom to the top, a very *slight* pressure being made, as a certain degree of compactness was found necessary to prevent the loam from separating or falling, when saturated with water. The pots therefore are filled as follows:

No. 1. Loam hard-packed up to within 1½ inch of surface; the loam then sifted in, and made level with the rim of the pot.

No. 2. Loam pressed down as hard as possible, and leveled as in No. 1.

No. 3. Loam merely sifted in the pot and leveled as in Nos. 1 and 2.

We may now consider that pot No. 1 represents a compact loam-soil, with the surface stirred, scarified or pulverized; pot No. 2, a compact loam-soil, without any surface pulverization; and pot No. 3, a loose, well-pulverized loam-soil. Now according to the teachings of the agricultural press, and, indeed, of all agricultural writers, so far as we are aware, No. 3, or the loose well-worked soil, should *longest* preserve the moisture. No. 1, on account of the surface pulverization, should retain moisture longer than No. 2, and No. 2 should, of the three, part with its moisture first.

As our experiments, with variations depending upon the heat of the sun, the moisture and movement of the atmosphere, have all pointed to the same conclusion, we will at this time detail only our last experiment. It is as follows: September 29, 10.30 o'clock A. M., the buckets were so far filled with water as that it should overflow the sides of the buckets upon the introduction of the pots of loam. This insured the same quantity of water in each bucket. At 12 o'clock noon, the water in No. 3 (loose loam) wet the surface. Time 1 hour 30 minutes. At 12.45 the water in No. 2 (compact) had just begun to wet the surface. Time 2 hours 15 minutes. At 2 30 the surface of No. 1 was as wet as either of the others. Time (it may have been less), 4 hours.

We have now to observe in which buckets the water soonest disappeared—that is we are to observe the relative power of capillary attraction and the rapidity of surface evaporation in each of the three pots of loam. Oct. 5—6 o'clock A. M. Bucket No. 3, (loose) was dry. Time 6 days, 7 hours, 30 minutes. Oct. 8—1 o'clock, bucket No. 1, (compact, surface pulverized) was dry. Time, 9 days, 2 hours, 30 minutes. Oct. 9—7 o'clock P. M. bucket No. 2 (compact) was dry. Time, 10 days, 8 hours, 30 minutes.

To state it in another way—the same amount of water carried to the surface by capillary attraction, was evaporated from the surface of a loose (mellow) soil in 6 days, 7 hours and 30 minutes; from the surface of a compact soil which had been pulverized an inch and a half in depth, in 9 days, 2 hours and 30 minutes; from the surface of a compact soil in 10 days, 8 hours and 30 minutes.

There is no question as to the fact that with a given rain-fall, more rain will pass down through the loose than through the compact soil because there is less opposition to gravity. But according to our experiments, more of it will return by capillary attraction and more of it, consequently will be evaporated from the surface unless the sub-soil is sand or gravel in which case the amount returning would largely depend upon the depth of the stratum of sand or gravel and the amount of rain-fall. There is no doubt either that hard, clayey soils are better conductors of heat than sandy loams for the reason that the latter imprison more air about their particles. While, therefore, the heavy soil would become heated sooner and cool sooner—the loose soil would require a longer time to heat and a longer time to cool. Again we do not take into consideration at all the amount of moisture a loose soil may take from the air more than the compact soil. These are different questions and do not invalidate the point we desire to make, viz., that stirring, pulverizing, scarifying, working, breaking up the surface soil instead of retarding the evaporation of moisture in the soil beneath, greatly facilitate it. If our reasoning or experiments are defective and our conclusion invalid, it will be easy for those who have studied such questions more than we have, to make their defects apparent. Even in that case, we shall take the credit, by a series of experiments in which some little patience was required, of having *endeavored* to throw new light upon "the most healthful, most useful and most noble employment of man."

River Edge, Bergen Co., N. J.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

The Rural, in a recent article, says butter, to be first-class, must be made and kept at a temperature of 60°. Not one cellar in a hundred is as cool as this, but, on the contrary, the vast majority of them will show a temperature as high as 68 to 70°. This is too warm for cream to rise good or for butter to keep well. The worst difficulty is in the making at such a high temperature,—as the cream is liable to get rancid while in the pans waiting for it to rise thick enough to skim, and while standing before being churned. If the butter is not made rancid by the putrid condition of the cream, it can be kept sweet by submerging it in brine, which will lower the temperature several degrees. Most cellars can be made from ten to fifteen degrees cooler than the air outside by shutting them up *tight*, and allowing no hot air to get in.

Our cellar is made fifteen degrees cooler by being kept closed day and night, and the thermometer stands at 64° to 66°, rising to 66° in the middle of the day, when it will mark upwards of 80° in the shade out of doors. First-class butter can be made at a temperature of 66°, provided the milk is set in shallow vessels (we strain the pans half full), and then skimmed *just as soon as the cream rises*, and the cream churned before putrefaction begins. In warm weather cream should not stand more than two days; that is, it should be churned the second day after skimming. At a temperature of 60°, the cream will keep better, and so will the butter, and this temperature is most desirable, but how are the majority of farmers to get it? The patent coolers with ice will produce it, or a lower degree if required, but the great majority cannot afford them, so that they must get as near to 60° as possible by shutting out the heat and by being prompt and vigilant in the care of the milk and cream, remembering that a putrescent taint in the cream will poison—yes, that is the word—the whole batch of butter, and in a short time it will become rancid, and must be sold at a reduced rate.

We do not feed the cows any pumpkins, preferring to give them to the hogs. They are a fine feed to give the fattening pigs a start, and excellent to put the store hogs in condition for winter. Boiled and mixed with meal they are nutritious and fattening, and help to keep up the appetite and the stomach in a healthy condition. We draw the pumpkins and throw them in heaps alongside the field where the pigs run, and twice a day crack them into pieces and scatter them around on the sward. We select a new place for every load, and this makes it cleaner for the pigs and prevents the grass from being trodden out on the feeding spots. When cows are fed pumpkins it makes them uneasy, and they will stop feeding in the middle of the afternoon, and be waiting and looking for them, and thus lose as much as they gain. The quieter cows are kept in the field the better; hence, it is a good idea to give them extra messes in the morning and then they will feed in the pasture until night.

We castrated four large pigs during the hottest weather, and they did well. They were not troubled with flies or worms, and the wounds healed in a very short time. We applied gas coal tar, and this is the reason why the pigs, although operated upon at a time of the year forbidden by the "signs" and the experience of "old times," did just as well as if the work had been done in cool weather. Dr. Stuart had a horse badly cut in the knee, making a deep and ragged wound. He bound it with gas coal tar, and left home, being gone a fortnight. When he returned the sore was healed, and this was all the treatment it received. We state these facts to convince farmers what a simple and effective remedy they can use for similar cases.

Farmers are still sowing wheat, and double the area will be put in this year as compared to many years before. The soil by rest seems to have replenished itself in the constituents requisite for producing wheat, and good crops are now had by those who have sown it on soils of different kinds, without heavy extra manuring. For twenty-five years past this has not been the case.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

THE BEST KIND OF FRUIT-PACKING.

It is about time apples were gathered, and much care should be exercised in doing this. Well graded, carefully picked fruit will always find a ready market at remunerative prices. The sale of a fine crop is often materially injured by a lack of care in assorting. If apples are graded in two or three classes, they will sell for better prices and much more readily than when all but the cider apples are packed together. But, to say nothing about the pecuniary advantage, the satisfaction of having fruit that is first-class to offer in the market is ample compensation for the time and labor employed in grading it.

Another thought—each variety should be kept separate. If a person buys a barrel of apples labeled Belle Fleur, he is not wholly satisfied if upon opening the barrel he finds, on top, a half-bushel of the variety he supposed he was buying, and the balance a varied assortment of Russets, Greenings and a dozen other varieties, all inferior fruits, and among the rest windfalls, that should have been fed to the hogs long before. I am ashamed to say it, yet there are farmers of my acquaintance who pack apples in just this manner. They do not realize the injustice done in this way to purchasers, nor the damage done to themselves. To label a package of fruit with the name of some standard variety, and then to place within it a nondescript collection of fruit, inferior in every way, is certainly a fraud, and no insignificant one either; and yet men do this who would stand aghast or indignant at the insinuation that they were dishonest. A producer who deals fairly with the consumer, who gives him the equivalent of his money, will soon become known as an honest dealer and will experience no difficulty in disposing of his surplus products at first-rate prices.

BENEFITS OF SEEDING WITH CLOVER.

It pays to seed with clover after every crop of winter grain. The ground from which the wheat was cut this season has afforded an abundance of pasture for two months, and this when no seed was applied save that in the manure with which the field was covered last fall. Were clean seed sown, the pasturage would more than pay the extra expense of seeding, not to mention the benefit the soil would derive from the penetrating and fertilizing qualities of the roots. Clover roots run deeply, and serve to conduct the ammonia from the air to the soil, thus enriching it to no inconsiderable extent. It is pleasing to see how generally clover is coming into favor among agriculturists. They see in it a sure and economical method of fertilizing their impoverished land, which has been cropped without mercy and then given a death-blow by seeding it with Timothy. Last year, with clover seed selling at ten or twelve dollars per bushel, farmers of limited means considered it too expensive; now, when it can be bought for four or five dollars a bushel, they are more willing to recognize its merits. Still, I contend that at the higher prices it can be sown profitably, even on ground where a crop is to be raised the succeeding season.

THE BEST SOIL FOR BUCKWHEAT.

While cutting buckwheat I noticed that the grain was much better on a narrow strip plowed early last spring, than on soil of the same quality which remained unplowed until just before seeding time. Three different plots were sown, one consisting of stubble after oats; another, a piece of new land from which the bushes had but recently been cut; and the third, an old meadow sod. From the results obtained, I am led to believe that sod ground is most congenial to the satisfactory growth of buckwheat, and that the sooner in spring the sod is turned, the better for the crop. Even a second plowing would, in my mind, prove advisable. Many farmers abuse this crop more than any other. They only pretend to cultivate it, but a little extra exertion on their parts would give them larger returns than could be obtained from most grains, everything considered.

PRESERVING POTATOES.

Many of my neighbors are leaving their potatoes in the ground, claiming that they will rot just as badly if dug and housed as though left, and that by leaving them undug until late, they avoid handling the decayed tubers. Now, I think, that when potatoes are rotting badly, as they are this season, they should be removed from the ground as soon as ripe and stored in some cool, dry place until cold weather. I have tried both plans, and am satisfied that the tubers are much more liable to decay when left in the ground in contact with those diseased. Assort carefully when they are gathered, and again before storing in a cellar, and but few decayed tubers will have to be carried out next spring.

MAKING TEA WITH COLD WATER.

Did any one of the Rural's many readers ever try making tea with cold water? If you never have, just do so the next warm day, when a cool refreshing beverage is desired. Place the tea in a pitcher in the morning, with just enough cold water to cover it. At dinner-time, fill the pitcher with cold water from the well, and you will have the best cup of tea you ever drank—that is for warm weather. The finer qualities of tea are much more fully retained than when steeped upon the fire. And who wishes a cup of scalding tea on coming in straight from the hot harvest field and the scorching glare of our August sun?

BLANKETING HORSES.

A pair of horse-blankets should be found on the premises of every man who owns a horse. It is a barbarous practice to allow dumb animals to stand uncovered in the streets, chilled to the marrow by the piercing winds of fall and winter.

NOTES FROM RURAL FARM.

Our wheat, both of the experimental plots and the main field, is well up. The shower of last night was much needed. The hot, moist weather which was believed to have shriveled the spring wheat, also harmed our winter wheat and oats. The yield of Clawson, instead of rather more than 25 bushels to the acre, has fallen somewhat short of that amount.

It is "a bad sign" that apple and pear trees are thus late pushing buds. We see fresh shoots of from one inch to one foot in length, while some of the trees are blossoming freely. The pushing buds and young shoots will of course be killed by the winter, while the fruit buds which open now to no purpose, might have formed fruit next spring.

Queens Co., L. I., Oct. 6.

Field Crops.

RYE—ITS CULTURE, ETC.

W. H. WHITE.

GROWTH OF CULTURE AND USE OF RYE.

At the present day, and for many years past, rye has been more generally grown in some portions of New England, than wheat. When wheat was a more sure crop, and when the inhabitants were less dense, there was less inducement than now to grow rye for its flour as a partial substitute for wheat; but in those days it gradually came into favor, in some localities, as a merchantable crop, to be transformed into "liquid fire," or for some other less objectionable use. Time passed on; wheat began to decline in ageable product; insect enemies and diseases increased, and as necessity or economy required, rye flour was introduced into domestic use for the more general purpose of making common bread; also, for mixing with corn-meal for brown bread, etc., some using it for gingerbread and the coarser sort of pastry. The common objection to its use in bread lies in its color being darker than that of fine wheat flour. It certainly is no less sweet than much superfine wheat flour, and I have grown it so that when floured and made into bread, a loaf made of it and another made of wheat flour could not by the color be distinguished one from the other. Here is an opportunity for the enterprising farmer to largely benefit his fellows, and also distinguish his own name, by improving and introducing a better quality of rye than is generally found in culture. That the grain is susceptible of improvement is a proved fact from the variations found in culture, some varieties being much superior to others. Winter rye is our most hardy and healthy winter grain, and can be successfully grown in all the States and Territories of our Union. With a little care and attention in culture, etc., it is capable of being decidedly improved in quality and production.

SUITABLE SOILS AND METHOD OF SOWING.

Rye does not require soil where clay abounds, or one best adapted to wheat, but one which is of a sandy or gravelly nature. The soil need not be excessively rich, yet should be in good heart from a mixture of mineral and decayed organic matter, producing a medium growth of straw, instead of an excessive one. Dry, high and airy situations are adapted for growing the best quality of rye. Sandy fields and "old plain" lands usually produce a fine quality, although the yield per acre is small. Such fields should be well and thoroughly plowed in August, lie some days, be then thoroughly harrowed, to destroy weeds, etc., have a dressing of four to six cords of well rotted compost, or its equivalent of good commercial fertilizer adapted to the purpose, spread evenly and worked into the surface with a cultivator or harrow. The seed should be evenly sown, broadcast or with a drill, any time during September. Although it

may be sown and do well any time before the ground freezes up for winter, yet the plant tillers better and yields more if the seed is sown earlier. Previous to September 20 is the better time here in New England. The seed should be well and evenly covered.

The quantity of seed per acre required for sowing, depends largely on the state of culture of the soil—the better the culture, etc., the less seed is required—the average quantity being one bushel per acre. On soil in fair heart, tilth and culture, that amount will give better satisfaction than any larger quantity.

If too much fall growth is likely to be made, milch cows, calves or light stock may be turned on and partially feed it off, and no injury will be done to the grain, while a gain is made in the stock and their products.

SELECTING SEED.

The seed should be pure, clean and of the very best quality of "White Rye." Unless perfectly clean and even, it should be screened through a sieve which will allow small and imperfect seeds to pass, or else be thrown, against the wind, across the barn floor, to allow the poorer seed to fall short while only that which reaches farthest should be used for seeding. In growing seed, it will pay to save the earliest, ripest and most perfect ears, tie all these in bundles, and keep them by themselves, and then only "top thrash," the bundles by hand flail; then screen as above. Rye which is one year old is preferable for seed to that grown the same year the seed is used. The rye crop, like any other farm product, is not entirely free from accidents, yet it is as little or even less liable to mishaps than any other grain. Rust sometimes affects the straw, causing shrinkage of grain; sometimes, yet seldom, is there blight in the ear; generally there is little of either, nor has it any insect enemies like these that are so injurious to the wheat crop.

PRODUCT PER ACRE.

The yield per acre varies with the soil, culture, etc., from eight or ten bushels on sandy fields with no fertilizers or culture, to forty and upwards, on better soil fertilized and well cultivated. But the grain is not the only product; the straw usually commands as high a price in the market as the best hay of the farm. Large demands are made for it by paper manufacturers, harness and horse-collar makers; livery stable men pay more for it, and prefer it above all other kinds of straw, as it wears much better. From three-fourths of a ton to two tons of straw are produced from an acre. Taking the above as a starting point, any one can calculate the cost of production as also the gross products and profits from rye culture.

ALFALFA—ON THE EAST OF THE ROCKY MOUNTAINS.

N. W. BLISS.

Some four years ago, I determined to look up and introduce here some kind of grass that would stand drought. For the five previous years this region had experienced an almost total loss of, or great annual damage to, all forage crops, by reason of drought. I therefore "read up" on grass everything I could find in my library, and by correspondence "posted" myself as well as I could. I came to the conclusion that, all things considered, the French Lucern, introduced into California from Chili, and known as Chili Clover, or better, by its single Spanish name of "Alfalfa," held out the best promise of being the grass I desired. I therefore ordered 100 lbs. of seed from a dealer in California. It cost then (1874) 19 cents per pound in gold. The premium, exchange and freight made it cost here about 30 cents per pound in currency. The St. Louis seed stores were, at that time, sending out small quantities of the seed by mail—prepaid—at about 75 cents per pound.

I sowed the seed in April, 1875—sowing eight pounds per acre on eight acres, and about twelve pounds per acre on three acres—I should have sown at least twenty pounds per acre. During the summer following, the eight-acre field was flooded by the creek, and Smart-weed grew very thick and high, and I had to mow it and haul it off. I feared the Alfalfa, which is quite delicate during the first year, was dead, as the slim tops shaded by the Smart-weed, were black and dead, but a close examination showed fresh, green leaves of Alfalfa close to the ground, so I was satisfied all hope of it was not yet lost.

I cut no crop, save Smart-weed, that season. The next year, 1876, I cut two good crops of Alfalfa hay, and a third crop was ready for cutting late in the season, when severe freezing took place. The third season, 1877, I cut two crops on the eight-acre piece and three crops on the three acres. I then turned under the eight-acre piece and sowed winter wheat, hoping thereby to thicken up the grass and to test, by actual experiment, whether it would grow again from the roots. A friend in California wrote that I would see which I had the most of, wheat or Alfalfa, when I came to harvest the wheat; and I did—the crops of both were about equal; the Alfalfa and wheat each being about six feet high. Cutting and thrashing were rendered exceedingly difficult by the tangled nature of the mass, as was plowing the fall before, on account of the tough roots. Some thirty-five days after cutting wheat, I went into that field with a mower and cut a good crop of grass. Of course, I had to cut the wheat-stubble with that crop. About forty days afterwards, I cut another excellent crop of Alfalfa hay. I consider that field as having done very fairly this year, in thus yielding a crop of wheat and two crops of hay.

The three-acre piece I cut first during the first week in May; again, the first week in June; a third time, the third week in July; and a fourth time, the first week in September. The weather was so cool at date of cutting the first and fourth crops, that extra time was required for curing the hay. For soiling, it could have been cut nearly a month sooner, and the cutting repeated every two weeks up to date.

When the Alfalfa had been down about ten months, I took advantage of the ground being soft and loose, owing to the frost coming out, and pulled up a root over two feet long. This fall, wishing to send a root to the St. Louis Fair, I sank a shaft around one to the depth of thirty-two inches, into very hard subsoil, and could not then pull the root up, and, a shower just then occurring, I cut the root off at that point. I have thoroughly accomplished my object, and obtained a forage plant that will not only stand drought, but which, on our bottoms, pays no attention whatever to an abundance of rain or the want of it. All this, however, would be of little use were the product—as some say Prickly Comfrey is—unpalatable to stock after one gets it. On the contrary, Alfalfa is greedily sought and eaten by stock of all kinds, the hogs even fighting away cattle to eat the dry hay made of it. The man who feeds the dozen mules which haul heavy loads over the rough roads of this region every day in the year, says that when the first Alfalfa is fed in the early summer or late spring, the mules do not seem to care for their grain.

I feel confident, from my experience with it, that this grass, by reason of its rapid growth, its independence of droughts, its many crops of large yield, its abundance of saccharine matter, and its adaptability to soiling, grazing and cutting for hay, is the most important recent addition to our forage plants. I say recent, because it is only within a few years that its value, or even name, has been generally known to the farmers of this country.

In Germany it is used as a soiling crop for swine, being mown and run through a cutting-box, sprinkled with meal, bran, etc., and fed to hogs, which fatten rapidly upon it. It must certainly prove the best soiling plant for dairies. Sowing it in the spring, so that it will not have third leaf till danger of heavy frosts is over, it will, I doubt not, flourish in any of our Northern States. I have heard of a field of it in some part of New York State, said to have been sown fifty years ago. Its roots will subsoil any kind of ground and open it up, aerate and drain it. I think no farmer should be without a field of Alfalfa.

Washington Co., Mo.

TOBACCO.

No crop which a farmer can put upon his land is more exhausting than tobacco. It takes all the virtue of the best soils to supply its peculiar nature and the large proportion of mineral elements and nitrogenous matter in its stalk and leaves. The following table will show the inorganic elements in 1000 lbs of the stem and leaf:

Phosphoric Acid	8.60
Sulphuric Acid	9.30
Lime	88.80
Magnesia	25.00
Potash	73.70
Silica	23.00
Total	228.40 lbs.

making nearly twenty-three per cent. To supply this is absolutely necessary for those who wish to raise good tobacco, and there is no profit in any but good. Other crops will not follow in rotation, as they will follow almost any other crop; for wheat would also require a large supply of phosphoric acid, lime, potash and silica. Indian corn also requires these ingredients in large supply, and so do rye, barley, buckwheat and oats as well as potatoes and all root crops. Hence, to raise tobacco, the crop may as well be taken from the same ground each year, and the grower must see that this amount of manure is annually returned in some form; he must return, besides nitrogen in nitrates or ammonia, at least 10 lbs of phosphoric acid, 100 lbs. of lime, 25 lbs of smagnesia, 75 lbs. of silica for each 1000 lbs. of tobacco he wishes to raise. Ground cannot well be too rich for this crop, but the manure must be of the character to return the same ingredients which the crop has taken away, and 1000 lbs per acre is a good yield.

The tobacco crop is, nevertheless, a profitable crop to raise, where the climate will allow it to be planted early enough, so as to obtain its full growth before frost sets in. The seed is sown very thickly in protected beds in March and transplanted as early as practicable in April and May, in rows two or three feet apart so as to allow of cultivating by horse plow one way. The ground must be fertile, and cultivation must be thorough to obtain good results. The plant grows from three to six feet high, and the flower-stem is topped off at half its natural hight to throw all the strength of the plant into from eight to twelve of its lower leaves which are the most valuable. Any broken stems or injured leaves are removed, as are all lateral shoots, and the closest attention must be given to the destruction of insects, the tobacco worm especially. In August or September the stalk is cut close to the ground and cured—sometimes by hanging upon poles, sometimes by first throwing into heaps to sweat. The leaves are then stripped and dried for packing.

The curing is an important operation and much depends upon this being successfully done. Accordingly artificial heat is necessary when the weather is cold and wet. As fancy runs to light or dark wrappers, the effort of the grower is to supply that particular kind. A few years since light wrappers were the rage, now public taste has turned to dark, and beside the natural dark leaf many processes of coloring have been introduced. The wrapper leaves are the most valuable part of the crops, but with the introduction of fine-cut tobacco and scrap cigars, everything is used in their manufacture.

When the crop is cured, it is packed in hogsheads, bales and boxes for shipment. The hogsheads range from 600 pounds, in Maryland, up to 1,500 pounds in Ohio. Three things are indispensable in growing tobacco: a rich soil, regularly supplied with ample manure; thorough cultivation, and great care in properly curing it. Oftentimes the crop in the same locality will vary one-half in value from neglecting these requirements.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

THE CONCAVE-LEAVED ASH—FRAXINUS CUNCAVÆFOLIA.

An old saying has dubbed the Ash, "The fool of the forest." Why I cannot say. There are doubtless weak points appertaining to Ashes as well as to other trees, diseases that attack them and peculiarities that mar their appearance. It must be acknowledged, however, that prejudice does exist in the case of the Ash, and possibly not always without justice. But there are Ashes and Ashes. They have certainly diverse colors, forms and habits to a degree realized by few, and are frequently very ornamental and desirable. The borer is accused of making occasional and deadly attacks on Ashes, but many kinds are generally healthy, *vide* fine specimens on lawns all over the country.

The concave-leaved Ash is one of these very curious Ashes that add so much variety to collections of lawn trees. The general character of the leaf is a rich, deep green, with curious outlines, but a young growth put forth from time to time, during summer and even autumn, constitutes its great peculiarity and charm. This young growth begins at the very tip to present a delicate white color flushed with pink, which changes farther down into white, then into white mottled or flecked with green, and finally comes the natural green itself. At a distance, these curious tufts of white foliage are very striking and picturesque, especially in fall, when other foliage is dull and yellow.

THE CUT-LEAVED SUMACH—RHUS GLABRA LACINIATA.

I have actually seen people select this Sumach in preference to the Hydrangea paniculata grandiflora. It showed great want of taste, I know, but then what can be said to convert such misguided persons! There are no strict canons of taste relating to plants, by which these persons can be convinced of their error, and consequently they will select what pleases them. Moreover, what can we say to unenlightened expressions indicating contempt for the coarseness of the great-flowered Hydrangea, and its unsightly leaves? Certainly no answer need be given seriously to the person who laments that he sees relatively so many Hydrangeas everywhere he goes, and wishes for a larger variety of old and new flowering shrubs. If a plant is good, why not use it everywhere singly and in masses, over and over again? Can we tire of a good thing? Does anyone regret the almost universal use of the Coleus and Centauria? Unfortunately we notice that the Rural is also a little hard on the Hydrangea paniculata grandiflora. However, be that as it may, people who admire exceedingly this cut-leaved Sumach, credit it with beautiful green leaves, like very coarse lace, and with a delicate young growth in June, unsurpassed in the way of fine dissections. In the fall, when they meet it in the somewhat obscure positions it often occupies, they are very apt to become enthusiastic over its rich colors, and also over the red seed-vessels erect on the stem in compact clusters. I know that the cut-leaved Sumach is difficult to propagate, and choice, but is it not a popular favorite? and to undertake to condemn popular taste, even on the score of a lack of general knowledge and ability to weigh the merits of various plants, is a responsibility I respectfully decline.

JAPANESE MAPLES, IN AUTUMN.

Among the notable qualities of Japanese Maples, is the beautiful fall coloring they present in certain varieties. An impression seems to exist that their rich colors, to do them credit, should be at their brightest throughout the summer. We see a highly wrought picture or unique specimen in early June, and consequently establish an ideal that most Japanese Maples will hardly equal. Immediately the conclusion is formed that Japanese Maples are unsatisfactory. But let such objectors pause and consider whether they know of any other tree that retains its variegation in the highest perfection throughout the season. I seriously doubt whether any variegated tree does better in this respect than the Japanese Maples, when the latter are well grown and in full vigor. But to sum up the perfections of Japanese Maples without including their fall beauties, would be a gross injustice. Strange to say, the parent, Acer polymorphum, excels all its varieties in the exquisite delicacy of its autumn colors. Several varieties such as roseum (a very scarce kind), rosenmmarginatum and dissectum, all color charmingly in fall, but scarcely equal the parent. This fall characteristic of a choice small tree or shrub, will afford additional means of introducing bits of bright color near the house where only dwarf and choice plants are desired. No tree of the forest can present more delicate and exquisite hues in autumn, than the little polymorphum Maple.

Flushing, L. I.

Miscellaneous.

THE TRUTH ABOUT IT.

[Under this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—Eds.]

SUPERSTITIONS.

Many people believe it to be a "bad sign" to kill a cat, and so they get rid of all their surplus cats by leaving them along the roadside in lonely places, or at night they drop them near some dwelling. Little kittens are often left by their weak-minded and cruel owners to perish by starvation or to be tortured to death by wicked boys or strange dogs. Many is the time we have seen poor wailing, starving specimens of this outrageous practice, and we hate the foolish superstition and the heartless fools who are governed by it. It is an easy thing to cut a cat's head off, (?) or to drown a lot of kittens in a pailful of water. It is not a pleasant thing to do, but it is not so cowardly and mean and wicked as to drop them at a neighbor's door, or to let them die by inches.

We saw, the other day, while crossing a bridge, in the midst of the Mohawk river, a poor kitten trying to swim for the shore. We asked two boys in a boat near by to take it to the bank They would not do it. Probably they had thrown it in, in obedience to the command of their parents, who took this way to get rid of a kitten which was not to blame for being born, and which was entitled to die without needless torture. What kind of Christianity, yea, humanity, must exist in a household where such unfeeling acts could be directed or in any way countenanced! Boys brought up in such an atmosphere and under such influences will make mean men, and very likely ripen into criminals, and finish up in a prison. A superstition which begets any such cruelty had better be rooted out at once before its natural outgrowth shall have sown seeds of crime and punishment for the children, and sorrow and misery for the parents.

F. D. Curtis.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

Rosselle, N. J., Sept. 23.

We have the finest double Balsams I ever saw, but I supposed the seed would be single next year, and therefore of no use. I have some Egyptian Sweet Corn, but cannot see that it is any sweeter or better than many other varieties.

J. R.

Newport, Vt., Oct. 2, 1878.

I know all about the glorious army of axe-grinders. There are no men I like better to snub. They are universally men lacking the best characteristics of manhood. They will try to use you, and if they find they cannot, they will try to harm you.

M.

Union City, Mich., July 25.

Having read the Rural's offer of Willow cuttings to subscribers, I wish to get some. I wish also to return thanks for the seeds sent. I should have done so before, but I have waited to see them in blossom, that I could tell of my success. The Pelargoniums, six in number, are now lovely with their crimson and scarlet. They are all single, but the foliage is beautiful. The

Shell-Flowers, Cleome and Ricinus are also in blossom, and I am well pleased with them; as they are quite new to me. I had five plants of Yucca and one of hardy Phlox, the latter was at least three months in coming up. Tomatoes, Green Gage, proved rather watery, perhaps owing to the soil in which they were planted, which is hard clay. You cannot know how much I appreciate these presents of seeds. It is so hard for poor farmers' wives to get spare change to purchase high-priced plants. A. M. C.

HOWARD LAKE, Minn., July 23d, 1878.

MANY thanks for favors which the managers of the RURAL bestow on us. I have only to look in my flower-garden to be reminded of the donation of seeds last year. Here I see the fine Pelargoninms, Godetia, Cleome and others, in their beauty. I often wish I could find something new for them; I would most cheerfully send it. MRS. S. A. M.

WEST JERSEY, Stark Co., Ill.

THANKS to the RURAL for Willow cuttings received. Now just a word with regard to myself. I own a good farm of 80 acres; rent it for two-fifths; support myself and five children from the rent; also pay taxes, and hire hedge trimming, yet manage to live comfortably. What corn is raised on the farm I feed to hogs. Our nearest railroad station is seven miles away, but we have six different railroad markets within ten miles of us. MRS. H. E. M'C.

JAMESTOWN, N. Y., July 30.

WILL the RURAL allow me to claim a cutting of the Willow? I have plants of Glaucium, Eryngium and Shell-Flower, from seeds you kindly sent me. The two former are not in bloom, but the Glaucium has sufficient beauty without a flower. The Shell-Flower is very curious. A lady in our neighborhood has some which she preserves for winter bouquets. It is very ornamental for this purpose. Success to you in your benevolent distribution. MRS. W. C. G.

LINCOLN, Mich., July 26th, 1878.

MY house stands on a dry, sandy knoll, where it is difficult to get trees to live, and as Willows are recommended as growing in such situations, I wish to get some of the RURAL's cuttings. I am anxious to try them. Of the six packets of flower seeds sent last fall, I have been able to raise plants of four. Two failed to come through carelessness. I have lost the labels, but have been able to recognize two of them from descriptions in the RURAL; of the other two, one has leaves that resemble those of Columbine; the leaves of the other are light-green, long, with curled edges. Neither of them has blossomed as yet. I raised but one plant of the Cleome, but that is flourishing nicely. I received and potted my Geraniums last evening; thank you for them; I shall do my best with them, I anticipate a great deal of enjoyment when they get to flowering.

M. W.

SAN ANTONIO, Texas, July 29, 1878.

I HAVE had the reading of your precious paper for 22 years. I have taken it myself ever since marriage, and my parents did so before that. I have tried very hard to get subscribers, but we have "put our tent" among non-reading people, who take no interest in education, and are, like ourselves, very poor. This is a lovely climate, neither so warm nor so cold as in New York or Pennsylvania, and here one is always enjoying a lovely breeze. I have greatly improved in health myself since we came here, and we are slowly and surely establishing a home for our little ones, by hard labor. I often wonder what my lady friends in the North would think if they had to work as I do, sixteen hours a day, year in and year out, and get along with two little log rooms and call it home, getting wet every time it rains, although better off than our neighbors. I have but just succeeded in getting my yard inclosed, so as to have a few flowers.

J. M M.

POQUONOCK BRIDGE, Conn.

I AM entirely satisfied with my bed of single Portulacas; they are in seven different colors, including striped; some measure two and a half inches across, one, an orange color, coming double. I removed and set them in a bed alone, and the next time I visited it, I found it covered with pure white single flowers. Yams were a long time coming; they are up now and growing finely, but not in blossom yet. The Chinese Yams are splendid: Phlox grandiflora is—Phlox grandiflora. What curious flowers the Cleomes have! They look like long-legged spiders. I do not know what ails my Zinnias Darwinii; their soil is rich, yet they do not give flowers so large as the old kinds do. The wind seemed to have particular spite against my new Snapdragons—the beautiful toothed variety—twisting and breaking them off to the ground. I have set out the tops; one or two may grow, but cannot be of much account, it is so late in the season. Perhaps I have beat everybody with my Cockscombs. Among mine is one three feet seven inches tall, with a flat stem over three and a half inches wide, and there are seven monster combs on it, besides innnmerable small ones; the widest comb is over 16 inches broad, and nine and a half inches through the thickest part. Who can beat this? All these plants are from seeds sent by the RURAL. Thanks, thanks every day; I do not forget. M. W.

P. S.—Striped and blotched Petunias, seed sent by RURAL, are true to name, and a bed of beauty, I assure you.

WHAT OTHERS SAY.

SILICA.—Mr. Lawes, of Rothamsted, in a communication to the Scientific Farmer, says that Professor Caldwell is perfectly correct in advising farmers to disregard silicated fertilizers. Silica constitutes the greater bulk of our soils, and is certain to be present in sufficient quantities for all agricultural requirements. He has supplied solnble silica, with alkalies, phosphates and ammonia, to pasture-land for more than twenty years, removing three tons of hay per acre per annum. The same manures without the silica have produced an equal amount of produce, and the amount of silica removed in the crop has been nearly the same in both cases. The straw of our continuous wheat crops contains the lowest percentage of silica in the most productive years. He mentions as an instance the year 1863. The plot manured with alkalies, phosphates and ammonia, gave the highest produce of any of the thirty-five years,—fifty-four bushels per acre and five thousand eight hundred and seventy-five pounds of straw, the percentage of silica in the straw of this crop, is lower than that of any other year. While, therefore, the strength of the straw and its consequent power to carry a heavy yield of grain are dependent upon climatic circumstances and not upon silica, we must not suppose the silica does not perform an important function in the plant. It is quite true that by water culture, maize and other silica plants have been grown without silica; but it is probable that growth under these conditions is attained with a wasteful expenditure of force. He is disposed to think that the cereal green crops and the grasses which take up silica in large quantities, possess an advantage, or, to use a common although not a very elegant expression, have a "pull" over those crops which take up lime instead of silica. Silica exists much more abundantly in the soil than any other substance; the roots, therefore, of silica plants are always in contact with one element of their food. Silica is also an acid ready formed, and the greater part of the potash existing in soil is combined with silica. Root crops, clover, and other leguminous crops, take up lime instead of silica. Except upon a very fine soil this substance is much more sparingly distributed, and the roots have to travel farther to find it; they have also to manufacture a vegetable acid in order to dissolve it. If they take potash from the soil as a silicate, they must decompose it and restore the silica to the soil. May we not, therefore, attribute some of the special properties of the graminaceous plants, their universal distribution and rapid growth, to the property of taking up silica? It is silica weeds (Couch-grass) which are the great enemies to the farmer. He knows that growing roots or clover is impossible unless the land is free from these pests; and if land is left undisturbed these soon attain possession of the soil. An analysis of the ash of the grasses only of a pasture gave Mr. Lawes thirty-three per cent. of silica, and comparatively small quantities of lime and carbonic acid. The ash of leguminous plants growing among these grasses gave thirty-three per cent. of lime and the same quantity of carbonic acid, but not more than one or two per cent. of silica. The leguminous plant having to form an organic acid and to take lime instead of silica, is clearly in a disadvantageous position compared with the graminaceous plants, and where food is abundantly supplied the grasses are capable of entirely destroying the leguminous herbage.

A VALUABLE HEDGE PLANT.—Mr. W. R. Smith, of the Botanic Gardens, Washington, says in the Star of that city, that he ventures to say that nothing in any list of hedge plants is equal to Zizyphus vulgaris or Jujube tree. It is a much hardier tree than the Osage Orange; smaller in growth, and not requiring the interminable labor to trim of that rampant-growing hedge tree. Our mutual friend, Thomas Meehan, informs him that an old tree grows near his nurseries in Germantown. Another tree, perhaps thirty years of age or more, grew near to the Senate wing of the National Capitol. It should be said rather, existed,—because it was robbed by large Sycamores and Silver Poplars till about two years ago, when it was moved to the Botanic Gardens, where it is now doing well, having borne 100 seeds this season. Six seeds, obtained from this small tree five years ago, produced the plants, now six feet high, the careful examination of which induces him to write thus earnestly of the Zizyphus as a hedge plant. Mr Brackenridge, Dr. Warder, author of the Essay on Hedge Plants, and others well informed on the subject, have made personal inspection with him, and pronounce in favor of its eminent adaptability to the purpose recommended.

MAKE GOOD BUTTER.—X. A. Willard says that with the present outlook, the prospect is that there will be a good home and foreign demand for choice grades of butter, while for the lower grades the market never looked more unfavorable, since oleomargarine enters into competition with these sorts, and can be produced more cheaply, and will be preferred by that class of consumers with whom a low price is a necessity. Again, as oleomargarine can be substituted for butter by bakers and pastry cooks, the demand for inferior butter is likely to be affected in this direction.

EXPORTS OF CATTLE PRODUCTS.—The National Live Stock Journal gives a list of the exports of cattle products for 1877 and 1878, and to it adds the annual aggregate showing the progress for ten years, from 1869 to 1878 inclusive.

CATTLE PRODUCTS.	1877.	1878.
Live cattle	$1,593,080	$3,896,818
Fresh beef	4,552,523	5,009,856
Salted beef	2,950,952	2,973,234
Butter	4,424,616	3,930,340
Cheese	12,700,627	14,103,529
Condensed Milk	123,801	128,118
Preserved meats	3,939,977	5,099,918
Hides	2,480,427	1,285,840
Leather	6,017,373	6,199,052
Tallow	7,883 619	6,695,377
Neat's-foot oil	19,720	17,447
Total	$46,686,715	$49,338,029

The expert of fresh beef does not go back beyond 1877; but, under all the other items, the aggregate is as follows:

1876	$36,852,556
1875	38,028,367
1874	32,662,325
1873	30,302,827
1872	23,755,327
1871	18,141,311
1870	16,594,169
1869	12,303,371

Here is a most satisfactory growth of an important export—that of 1878 is more than four times that of 1869. Preserved meats did not reach a million before 1877, yet in 1878 they exceed five millions; fresh beef also reaching five millions the second year. The export of live cattle only reached about one-half million before 1875, and increased $2,303,738 in 1878. Cheese alone, in 1878, is about two millions more than all the cattle products exported in 1869.

RECKLESS HUNTERS.—A writer in the Herald complains that they needlessly break down fences and shake the best apple and peach trees. This people do not like. There is plenty of game and loads of fish up in the country. Let them take all belonging to them in a fair way, but let them not waste good fruit or break fences.

ONE CONSOLATION.—The Mass. Ploughman says that farmers have one consolation in a season like this, and that is, they have the prospect of enough to live on, at any rate, which is more than many engaged in other pursuits have.

CRUELTY is not only wicked but most improvident, and the cruel man, boy or woman, should find no place on the farm, even if he offered his services for nothing. So says the London Ag. Gazette.

CLUB-ROOT.—Mr. Vick says the best preventive is lime and phosphate manures.

FARM NOTES.

WHY has it never occurred to farmers and grain-growers that they can breed in-and-in with grain as well as with stock; or, in other words, may we not decrease the vigor of grain by continuing to sow seed from our own bins? Farmers should think of this, and if they find they are in-and-in breeders of grain, let them try a change and see the result. I have sown wheat after oats this fall, instead of corn, as I have formerly done. Corn cannot be removed in time to get the wheat in early enough. I sowed with a drill, and used the Clawson variety instead of Kentucky White. A heap of barn-yard manure was drawn out last spring, and, being thoroughly rotted, was applied without any danger of its containing weed-seed capable of germination. In former years the land had been cleared of stones enough to admit of clean culture, but, to make it a thorough job, I set men at work with bars to follow the plow and dig out all the stones that still remained, to be removed by the boat. Next, I hired a layer to put them into a wall as they were drawn, thus turning what was useless and troublesome into a good fence.

The slow, heavy horse is no horse for the farmer in these times. A medium-sized, active animal that can go from eight to ten miles per hour on the road, and haul two tons per pair on the farm, is the farmer's horse.

Cows should not be allowed to fall off in condition now. I am feeding mine all they can eat, both night and day, by filling their racks as full as I can at night and pasturing on the meadows through the day. I think their droppings repay the soil for the grass taken until the fall rains come on, when they should not be allowed to run there. My yearlings are kept in the best of pasture, to urge on their growth before winter. Calves are fed a mess of middlings every day.

Col. Curtis says farmers should keep more sheep. I agree with him. No farm should be without at least a few of this most useful and profitable stock. They will put money in the pocket from lambs and wool, to say nothing of the assistance they give in destroying weeds and briers. If there is a field overrun with that nuisance, the Daisy, turn in your sheep before it is ripe, and that is the end of the pest. Then, their manure is very excellent and well distributed. They also furnish us both food and clothing. Now, that prices are low, is a good time to purchase enough of them to start with.

In the fall of 1875, I purchased a trio of Berkshire pigs of a noted breeder, and, feeling rather proud of them, I gave them the best of care and did not breed in-and-in. I obtained but three pigs from one sow, when both of the sows went farrow twice. Will some one point out the cause of such ill-luck? The boar was all right.

Galway, N. Y., Oct. 2, 1878. W. A. H.

SETTING EXAMPLES OF ART AND TASTE.

WE see a paragraph reporting that CYRUS W. FIELD has given the sum of $10,000 to the village of Williamstown, Mass., to be used in beautifying the main street upon which Williams College is situated. Could such an example be followed, if only to the extent of a few hundred dollars, in removing unsightly objects, filling up and grading and sloping the side-walks, planting trees etc., in every village in the land, what would be the effect upon the inhabitants and the public spirit of those places? The work would of course be done, after obtaining the advice of a landscape gardener, by the laborers of the village, and not a dollar would be sent away, while the example would become epidemic through the whole town and every cross-street and every man's homestead would feel the effects—in increasing enterprise, civilization, intelligence and the industrial interest of the land.

BOOKS RECEIVED.

"Talks on Manures," by Joseph Harris, M. S. author of "Walks and Talks on the Farm," "Harris on the Pig," etc., published by the Orange Judd Company, 245 Broadway, N. Y. We have read this work of 356 pages, with great care, and not a little profit. Its scope embraces the whole subject of manures and fertilizers, their composition, effects, best mode of management, and application, records of various experiments with different kinds, both in this country and in Europe, together with suggestions as to the sorts most suitable for nearly every kind of crop, and on every kind of soil. Nor is it limited to manures only, for incidentally nearly every branch of farm economy is instructively handled. It is a storehouse of valuable information on farm topics, derived from large personal experience, and from a wide acquaintance with the experiments, researches, and best practices of the great lights of agricultural science, and agricultural art. The form in which the work is written, is well adapted for the lucid discussion of all sides of disputable questions. It is in the form of a dialogue between the author, the Deacon, the Doctor, Charley, and the Squire, the author, as is proper, doing most of the talking, while occasionally one of the others starts objections to the views propounded, and sometimes supports these objections by at least plausible reasoning, as well as by the results of actual practice. In this way many of the subjects treated of, are viewed from different standpoints, and if we do not always agree with the conclusions arrived at, we must invariably derive instruction and pleasure from the discussion.

Starting out with the declaration that on his own farm he is aiming to get 35 bushels of wheat per acre; 80 bushels of shelled corn; 50 bushels of barley; and 90 bushels of oats; 300 bushels of potatoes, and 1200 bushels of mangel-wurzel on an average, the author gives full information throughout the book, of how other farmers may accomplish equally desirable results. In addition to a full table of contents; there is attached to the work a complete alphabetical index of all the subjects mentioned in the text—the value of which as a means of ready reference, can hardly be over-estimated. The work is clearly printed on tinted paper; and neatly bound in cloth, and should find an oft-visited place in every farmer's library or book-shelf.

CATALOGUES, &c., RECEIVED.

CIRCULAR AND PRICE-LIST of Small Fruit Plants, offered by Gibson & Bennett, Woodbury, N. J.

CIRCULAR. Rickett's New Seedling Grape, "Lady Washington." James H. Ricketts, Newburg, N. Y.

JONES & SONS' Lake View Nurseries, Rochester, N. Y. Wholesale price-list of fruit and ornamental trees, small fruit, plants, &c.

BRIDGMAN'S Descriptive Catalogue of Bulbous and Tuberous Roots, with directions for management. Alfred Bridgman, 878 Broadway.

MONTHLY REPORTS of the Kansas State Board of Agriculture for May, June, July and Augnst. By Alfred Gray, Secretary, Topeka, Kansas.

"FRUIT-GROWING AND FARMING." An address before the Solebnry Farmers' Club of Bucks Co., Pa., by William Parry, of Cinnaminson, N. J.

PREMIUM LIST for the Fourth Annual Fair of the Dickinson Co. Agricultural Society, to be held at Abilene, Kansas, Oct. 9, 12. J. B. Edwards, Secretary.

ANNUAL CATALOGUE of Thoroughbred Dutch-Friesian Cattle of the Unadilla Valley Herd, for 1878. Address Irwin Langworthy, Secretary, South Brookfield, N. Y.

VICK'S Illustrated monthly, Rochester, N. Y. Tulips, Hyacinths, Crocus, Colchicum, and

Snow-drops, are the subjects of the colored plate of this number. It is full of lively and interesting floral articles.

Rural Architecture.

A CONTRAST.

HERE are two pictures, one representing a comfortable suburban home as it ought to be in summer time, and the other unveiling, too truthfully, what we frequently find in city and suburban districts, especially in tenement quarters. What miserable enjoyment such backyards afford the weary workmen who toil hard all day long and need rest and relaxation in the evening! And what a play-ground for their children! A first-class place, perhaps, for earth castles and mud pies; but where is the father who would associate his children with the rubbish of such a place, rather than with the purity of a beautified, vine-bedraped and flower-bedecked inclosure. In a moral or sanitary point of view, the yard of Wistarias, Virginia Creepers, Honeysuckles, Pipe Vines, Akebias, Japanese Ampelopsis, Yuccas, and orderly tidiness, surely far surpasses in goodness that of the accumulated conglomeration of old barrels and boxes, tin kettles and other disorderly rubbish.

Nor is it immediate so much as future ill effects such surroundings rivet on our children. Soloman says, "Train up a child in the way he should go, and when he is old he will not depart from it." Therefore are we to understand that children nursed in such unbecoming wretchedness, will, in after life, prove indifferent to greater refinement. It becomes us to do our best in the external decoration of our homes, because our attachment to them is thereby cemented and our dispositions purified, and the refining influences exercised on our own families as well as our neighbors' are surely a reward worth working for. A bad man and a pretty garden are seldom associated; but, on the other hand, the external adornment of our domiciles is a commendable reference to ourselves.

In rural districts, too, where there is no excuse whatever, we not unfrequently find a parallel to the worst kind of city backyard negligence. But we are pleased to note that both in city and country, great strides are being made in the right direction, and that a healthy rivalry in garden precedence prevails. Therefore we hope that before long, the tardiest may be shamed out of their indifference, and compelled, if for no other reason than fashion's sake, to travel the paths of education and intelligence, and beautify their homes with ornamental trees and flowers.

A SLIGHT MISTAKE.(?)

THE RURAL of September 23d says: "All builders agree in this: The most economical form in which a dwelling can be erected is a cube, for the reason that it contains more space within a given area of wall and roof than any other."

An old Judge said to one recently appointed: "Never give reasons for your decisions unless you feel obliged to. For while your decisions may be in the main correct, when you undertake to give reasons therefor, you will be very likely to get things confused and make erroneous statements."

So, in the case of the above extract, it is probable that, all things considered, a cube is the most economical form for a dwelling But the reason given is not the true one. A circumference measuring 100 feet incloses an area of 796 square feet; 100 feet in form of square, with sides 25 feet each, incloses but 625 feet. The nearer the circular form, the greater the area.

The advocates of the octagon form of houses, who wrote considerably on the subject a few years ago, made this their principal argument. That form never became popular, however. What was saved in building the walls was usually lost when the area was divided into rooms, by the irregularity of form, or if regularity was obtained, then by the waste of room sacrificed to obtain it. L. A. B.

[We should still say that the most economical form in which a building can be erected is a cube. We think "all things considered" is understood.—EDS.]

The Apiarian.

BEE HINTS FOR OCTOBER.

ABOUT this time in October preparations should be made for wintering bees. For this purpose I have found the following precautions successful in my case, and although others may prefer a different course of action, I have had no ambition to abandon a good practice to search for a better: All good stocks should be wintered. From 25 to 30 pounds of honey should be left in every hive. To ascertain the quantity in the hive, weigh it and its contents, subtracting, from the result, the weight of an empty hive of similar size, thickness of boards, etc., together with, say, six pounds for weight of bees, wax bees'-bread. Call the balance of the w t honey, and unless the combs are very old, the calculation will be about right. It is important that just the right amount should be left, as too much is almost as hurtful as too little. If any combs in movable frame-hives are filled throughout with honey, they should be alternated with such as are empty. Any stock that is too weak and without combs enough to hold a sufficiency of honey, should be taken up at once. If there are combs enough, but not enough bees and there is no condemned colony to reinforce them, they should be treated in the same way.

At the risk of repeating an oft-told lesson to every reader, it is well to urge the necessity of strengthening one weak colony by uniting to it another of the same kind, and supplying them with honey enough, so that all the stocks will be strong and well supplied against winter. Hives from which condemned colonies have been removed, should have the dead bees taken from between the combs and be set away for use next year. They should be set right side up, kept dry, and have all holes that would admit a bee, stopped up. If a colony has bees and combs enough, but lacks honey, this may be fed up to the required weight just about this time or so soon as the brood is all hatched. The feeding should be done as quickly as possible or the bees may use too much in rearing broods. The extra supply may be fed conveniently, in box hives, in a shallow dish placed on top of the hive with cut straw or shavings in it to keep the bees from drowning. The sides of the dish should be rough enough to make it easy for the bees to creep up and down. Two or three holes should be bored in the top of the hive, and the whole covered with a close-fitting box to keep away robbers. In case of movable frames, the combs may be taken out and held at an angle of 45°, and the honey or syrup poured into the cells through a flat-bottomed, tinned dish, having twenty or more small holes punched in the bottom. When one side is filled, the combs can be turned, and the process repeated with the other side. A good but cheap honey, like West Indian, may be fed with profit, but in such a case, in order to be safe from disease, add a quart of water to ten pounds of honey, or proportionally, scald thoroughly and skim. If honey in the comb is preferred, the caps of sealed combs, should be shaved off with a knife.

As bees might starve in cold weather with plenty of honey in the hive, all winter stores should be in the same compartment with the bees. All stocks one year old that have not been examined with regard to foul brood, should be at once attended to On no account should an honest man allow a hive with foul brood to be robbed. It would be an injustice to his neighbors to allow it to stand exposed to be robbed by their bees. Honey from such hives should always be scalded before it is permitted to go into healthy stocks. Look out for queenless stocks or barren queens, and either combine stocks or furnish good, healthy queens.

W. L. M.

AS WE TOO OFTEN SEE.

PROFITABLE BEE-KEEPING.

I NOTICE in the Apiarian Department of the RURAL an account of some large yields of honey. I am interested in bees, and can show a larger yield than those. I commenced with 26 swarm in the spring. I have increased them to 57 good swarms with honey to winter them, and have obtained 1,800 lbs. of basswood honey, 2,100 lbs. of buckwheat honey, and over 100 lbs. of comb honey in frames and boxes. This is all extracted except the 100 lbs of comb honey. I keep bees for profit as well as for pleasure.

WEST GROTEN, N. Y. D. H. C.

Sheep Husbandry.

RAISING ANGORA GOATS.

FOR several years our farmers have heard varying reports of the results of an effort to introduce the raising of the alpaca sheep and the Thibet, Cashmere and Angora goats into the United States. Some of these reports have wholly scouted the practicability of the business, largely because the writers had no reliable data upon which to base their convictions, and largely from the fact that until the manufacture of the wool, or rather the hair, of these animals, was established, there was no market for the product. Other reports have been quite extravagant in their estimates of the value of these animals.

As we now have a considerable number of manufacturers using this hair, and there is as ready a market for it as for wool, it will be well for farmers having rough, hilly, rocky and mountainous pastures or other high land covered with bushes, to understand the value of these goats as an additional feature in farming pursuits.

The number of goats, sheep, llamas and similar animals existing in North and South America and Europe is quite large, but as yet no great value has been attached to many of the species. Europe and America raise the common goat for milk, while in Asia the Cashmere goat, the Thibet goat and the varieties of the Angora goat are raised for cashmere and mohair. Cashmere is the undercoat of a species of the Thibet goat produced at Cashmere. Mohair is the fleece of the Angora goat. Beside these, the Rocky Mountain sheep is found in our far West, and as the range of mountains is followed Southward, we meet the Mexican goat, and still further south, the llama and alpaca of the Andes.

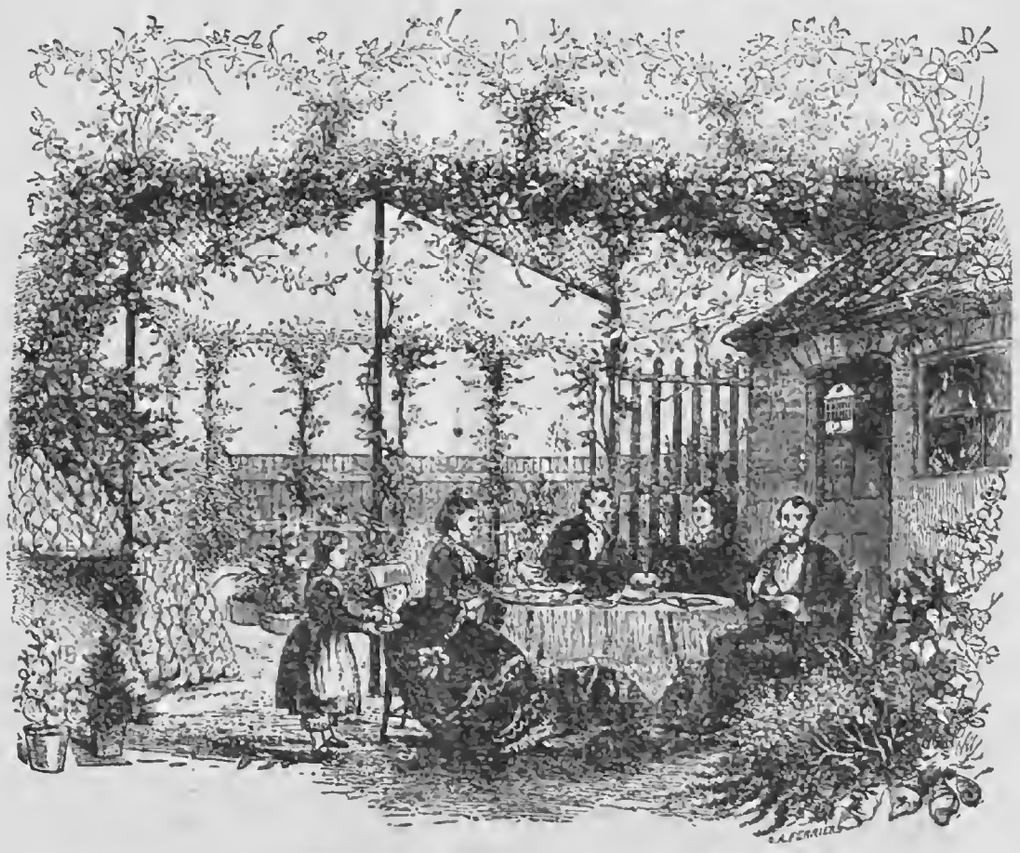
The only animal of this character yet found valuable in the United States, besides the common sheep and its improved breeds, is the Angora goat, imported originally from Asia Minor. This animal, the Capra Angorensis, was introduced into the United States in 1848, by Dr. Davis, of South Carolina, who brought to this country nine goats, a present from the Sultan of Turkey. Since that time, various importations have been made by other parties in the Northern, Southern and Pacific States.

Mr. Peters, of Atlanta, Georgia, has been very successful in breeding these goats, and many of his fine animals have gone to the Pacific coast, while there are now in California, Oregon and Washington Territory probably over one million goats. There are several flocks in the vicinity of San Antonio, Texas, crossed with the Mexican goat, and the raising of goats is there found a source of great profit. Several small flocks have, from time to time, been reported in the Northern and Eastern States, but we know of no extensive effort to breed and acclimate them.

In the Pacific States the Angora goat is chiefly raised for the purpose of increasing and supplying the demand for new flocks, and also to furnish the skin, which is tanned with the hair on for a great variety of purposes. The hair is all used in home manufacture, being shipped to the Eastern States for manufacture into the various kinds of ladies' dress goods. The product averages from five to eight pounds to a clip, and is worth 75 cts. to $1 per pound.

The object several farmers of Oregon have had in purchasing the goats, was to have them open their large tracts of "brush land" to kill out the brush, which the animals do thoroughly in two or three years. Like the common goat, the Angora thrives best unconfined, summer or winter, and upon a rough, hilly, and rocky pasture where his food can be varied from coarse browsing to the finer grass.

The alpaca (Camelus paco,) was introduced into the United States several years since from Peru, by ex-Gov. Thomas of Maryland; but was only partially successful with him, and the flock of fourteen originally imported, did not increase to any extent in numbers, and was afterwards sold to other parties, some of whom report a belief in the practicability of their growth in the United States. The alpaca wool is far more valuable than the wool of our best breeds of sheep, being longer and finer and of a beautiful, glossy appearance—either black, white or gray. The fleece weighs about seven pounds to a shearing, and the wool is worth from 75 cts. to $1 per pound. England imports 3,000,000 pounds annually besides what she obtains from her Australian colonies.



AS WE TOO SELDOM SEE.

Industrial Implements.

FRENCH BUHR-STONE GRIST-MILL.

WE have recently seen a compact little mill well adapted for farmers' use. The driving pulley is twelve inches in diameter, and the mill may be run up to six hundred revolutions per minute with from three to six horse-power, grinding ten to twenty bushels of corn, or fifteen to thirty of feed. The main points of its construction are strong iron and steel frame, inclosing selected French buhr stones, eighteen inches in diameter. The stones are banded, faced, furrowed and in what seems to be perfect balance. They are held in an iron hoop, the back half of which is bolted to the feed-plate and front pedestal in a way to bring the face of the bed stone in train with the spindle. The bed stone is cemented and held in position by bolts passing through rubber springs, which yield when any foreign substance passes in with the grain, preventing breakage. The construction of the mill is scientific, simple, strong, and likely to be very durable. It requires no fitting after leaving the manufacturers. Bolt it to the floor, and it is ready for work. The mill weighs only seven hundred pounds, and is guaranteed. Those interested will be more particularly supplied with information by addressing the makers, Richmond City Mill Works, Richmond, Indiana.

Dairy Husbandry.

THE BEST COWS FOR THE DAIRY.

A JERSEY FARMER.

A PROPER fitness of things is most important in dairying. Doubtless there is no other branch of rural industry in which so much is lost by want of the consistent application of the best means to the ends desired. This is seen everywhere, and it is only very rarely that we can find a dairy so managed that everything is of the right kind and everything is in its right place. The few dairies that are so managed are widely talked of and written about, but it is one thing to see what ought to be done and quite another to know how to go about doing it. It is not much that dairymen can afford to give to their neighbors, but they can and do give advice; for advice is cheap and everybody has plenty of it to give away. But like most cheap things, it is generally worth very little, for the reason that advice is given from the giver's own stand-point and the beneficiary is unable to avail himself of it for many good reasons. In Dairymens' Conventions for years past, and in published articles and books upon dairy topics, there have been floods of advice given as to the best stock to keep in dairies. This breed has been advocated and proved to be the most profitable; and, on the instant, another has as clearly proved that breed to surpass all others. The Jersey, the Ayrshire, the Short-horn, the Dutch—misnamed Holstein—all have been shown to be the best. And pure-bred animals have been recommended, too.

Now, here is a fatal mistake at the start. Not one man in ten thousand is situated so that he can avail himself of the advice given, although he may have desired to do so. It is not what a man might or should do; it is what he can do, that is the great point. It may be said very truly that no pure-bred herd of cows, bought at high prices, has ever satisfied the expectations of its owner who has looked for profit from milk, cheese or butter as his object; and, if any advantage has ever been gained from pure-bred animals, it has only been through the slow building up of a herd of grades by their use. This happens very fortunately, because there are very few who can sink so much money as would be required for the purchase of a herd of thoroughbred cows of any breed; but almost any dairyman or farmer can procure a choice pure-bred bull of whatever race he may desire or fancy, and with patience and skill he can, in a few years, build up a herd that will equal the pure-bred cows, if they don't greatly surpass them. And the cost of the herd may, by good management, be so little that, without strict accounting, it may never be traced. Now, such a herd will furnish the best cows for the dairy.

Every dairyman knows what he wants. He wants the largest possible supply of the richest milk. This is the end for which he works. He has the materials in his hands, or, if not, he can easily procure them. All he has to do is to use them in the best manner for the end desired, and, if he does not yet know how to do it, that has to be learned the first. If he will free his mind from all hankerings after the impossible possession of some fancy stock, which would only disappoint him, perhaps ruinously, and do the best with what he has, laying out a plan for at least ten years ahead, then he will surely succeed in getting what he wants. One extra good cow, with a well selected *pure-bred* bull, will be enough to start with; and, if only the best are picked to breed from, and the heifer calves from these are carefully raised, so as to give them a healthful and complete development from their birth, then full success will be but a question of time. He will, in a few years, have the best cows for *his* dairy.

In the meantime it would be well that those writers and speakers who are so enthusiastically advocating their choice breeds, and riding their own particular hobbies so furiously, should give us a rest. It would be better that they should turn their talents to the study of general principles of breeding and rearing dairy cows, so that whatever breed a man may have, he may be taught how to make that the best for himself, rather than be induced, by wildly exaggerated estimates of what this cow or that might do, to choose such animals for his use that must of necessity be a failure from the outset. We should not then see a big-paunched, heavy-feeding, Dutch cow, of a race reared in the most luxuriant meadows of North Holland, trying to pick a living upon a pasture where a small cow and a light feeder might thrive, but where the money spent in purchasing anything else might as well have been cast to the winds. There are places and circumstances suited for each of every kind; but to avoid failure, the kind must be accurately fitted to place and circumstance. Where a dairyman possesses abundant capital for his business, and can choose what he pleases, he will yet find it more profitable to select grades or cross-bred cows than any of the pure breeds, if milk and butter of the best quality, at the cheapest rate, are desired.

The Jersey is, without doubt, the richest butter cow, but of ten of these cows one, perhaps, may make more in quantity than a good native cow, while the rest will fall below. The Ayrshire is a copious milker upon fair pasturage. The Dutch cow is a heavy milker upon such a luxuriant pasture as is rarely found in America, but the milk is not rich, excepting in very rare cases. A cross of the Ayrshire or the Dutch, by a Jersey bull of excellent quality, would produce a cow that would yield a large quantity of rich milk, and that is what is required by every one who keeps cows, whether for milk or butter or cheese. Money will do in a year what labor will require many years to do, because it represents and can command the accumulations of labor. But unless the labor or energy has been at work to produce what is required, all the money in existence could not command it. So money cannot procure a herd of the *best* dairy cows, because we have not yet created that kind of cow. The possibility is still in the future, and it looks towards the cross of the breeds referred to.

Industrial Societies.

TOWN FAIR AT MANCHESTER, VERMONT.

MR. E. L. TAYLOR sends us an interesting account of a local fair held in the above town on the 3d and 4th inst., and of the energetic efforts of the gentlemen by whose labor the custom of holding such fairs has been restored after a lapse of many years. Contrary to the experience of many large fairs, the weather during the continuance of this, was delightful and the attendance accordingly excellent. Floral Hall was crowded with fancy work and articles of domestic manufacture in addition to a rather slim display of the odoriferous treasures from which it derived its name. Machinery and vegetables had to go nearly unsheltered, but there was a fair show of horses, although the stallions were noticeable by their absence. There was a good display of full-blooded Jersey cattle, although most of the cattle exhibited were grade Holsteins. The presence of these animals conveys a valuable lesson to farmers elsewhere. Until a few years back there was little interest taken in pure-bred or even good grade cattle in that neighborhood,—the old scrub stock seemed to give entire satisfaction. A few years ago, however, a pure bred Holstein bull was brought to the place, when straightway a lively interest soon arose on the subject of cattle breeding, much to the betterment of most of the horned stock in that section.

Everywhere.

RURAL SPECIAL REPORTS.

CHARLES W. GARFIELD, the capable Secretary sends us the following letter. We hope our friends who have valuable suggestions to make, will communicate them to him:

MICHIGAN STATE POMOLOGICAL SOC'Y.,
Secy's. Office, Grand Rapids, } Oct. 7, '78.

I would like to receive any suggestions that may occur to RURAL readers in connection with a revision of the Pomological Department of our State Fair Premium List, as we are about to arrange it for another year. Let them please write me their views as soon as convenient, for we desire to make our work better every year, and need the aid of all our friends. Our annual meeting will occur in Paw Paw, Dec. 3, 4 and 5. Will RURAL readers kindly suggest for discussion, any questions that they would like to have brought up at that meeting, and will they not plan to be with us if practicable? I should be pleased if they write me fully and freely concerning these matters.

CHAPEL HILL, N. C., Oct. 7, 1878.

ONE week of October gone, and no frost in this part of the State. Now that the crop is harvested or fully decided, it is practicable to make a final report. All considered, there is great cause for profound gratitude to the Giver of all good, for His beneficent providence during the year. Though the wheat harvest disappointed the farmers, there is evidence of a good supply, as the price of flour ranges from $5 to $6.50 per barrel, and wheat from 80 cents to, perhaps, $1.20 per bushel. This is very low for N. C. Oats, also, are lower than usual, I think. Corn is plentiful; probably much more so than was anticipated by some during the growing season. The fodder, though some was injured by the rains, is more generally saved, and in better condition than last year.

The tobacco crop is not very full, and was cured with difficulty during the rain-storms in September. This plant, which was, till recently, mainly restricted to a few counties in the northern center of the State, is now cultivated extensively in more western districts—some even in the mountains—and is, also, gradually working its way into the cotton territory. But that which is raised in the tier of counties lying between Raleigh and the Richmond and Danville Railroad, is considered the best in quality.

Cotton, though it has suffered injuries in some places, from several causes, appears to be maturing well. In conversation with an intelligent planter, recently, I was informed that a close calculation had proved conclusively that it is cheaper for the cotton raiser to restrict himself to that staple and to buy all his supplies of other products. The policy is certainly in harmony with the principle of Division of Labor, and hence seems to be judicious; but when the staple fails or falls to a very low price in market, the planter is in a very pitiable condition. There seems to be little, if any, disposition to abandon or diminish the production. In the cotton districts, Cotton is still King.

The abundant warm rains in August and September have brought out an extraordinary crop of grass. I do not remember ever to have seen more grass in the country than I have seen this autumn. Millet is raised in many parts of the State and the reports are favorable. Chufas are gaining in reputation, decidedly; the plant being in favor for forage and the "nuts" for the hogs. Sorghum is still raised in considerable quantities. I observe that a steam mill, for the manufacture of the syrup, is working in Salisbury, turning out a large quantity daily. Many do not like the Sorghum because, perhaps, it reminds them too forcibly of the dreary days of the war, when it was almost the only substitute for sugar and molasses.

The sweet potatoes, as well as the Irish, are yielding most abundantly. I planted but few, and they of a variety called the "Shipwreck." The seed, I have heard, were found on a wrecked vessel on our coast, years ago. They grow large, have but few in a hill, but have the desirable quality of coming early and being good for use as soon as they are large enough to eat. I prefer them to any other variety. The Western counties have quite an abundance of fine apples, but the center has but few. Grapes, garden products, etc., have done remarkably well. There is some interest in bee-culture, but not as much as there should be. The best honey in the State is what we call the "Mountain honey." It is very much superior to that made in the Center or East. The appearance and taste of the mountain article are quite different from those that mark the product of other parts of the State. Some of the best of this—pure honey—is selling in our market at 15 cents per pound.

There is an effort to get up a crusade against dogs, in defence of sheep-husbandry. I hope it will succeed. We have every requisite for profitable wool-growing, except immunity from the miserable, thriftless curs. There is a strong movement in favor of "no fence," but it will be years before intelligence can rule ignorance or enlighten it on that subject. As far as tried, the law has given much satisfaction. The Commissioner of Agriculture has been stumping the State, making many speeches on the general idea of progress in industrial pursuits. The effect of his commendable campaign is gratifying. He is a fine speaker, an enthusiastic friend of honest industry, and an indefatigable worker.

The Experimental Station here has received a valuable addition in the person of Mr. Warnecke, who is well known to Profs. Atwater and Johnson as a man of extra accomplishments for his peculiar work. He is an admirable assistant to the chemist, Dr. Ledoux. Next week the State Fair comes off at Raleigh. The indications promise a highly successful occasion. Old Rip Van Winkle is advancing. A. W. MANGUM.

ITHACA, N. Y., Oct. 2nd 1878

Farmers are busy hereabouts thrashing buckwheat and digging potatoes. Buckwheat, of which quite a large amount is raised in this locality, is a fair crop. Early Rose potatoes are very small, and a poor yield; late potatoes planted at the same time (May 1st) are much better, but not nearly up to the average. A larger acreage of wheat has been sown here this season than usual, mostly of the Clawson variety.

Splendid weather, a heavy frost Sep't. 28. Although prices are low, farmers are cheerful. Prices are about as follows: Wheat, $1; rye, 60c; oats, 27c; potatoes, 50 to 55 cts. per bushel; apples, 25c. per bushel; butter, 15 to 17c. per lb; eggs, 15 cts doz; hay, $6 to $7 per ton; straw $4. Apples a drug in the market. Good-sized potatoes hard to be obtained.

"ANON

BLUFFTON, Allen Co., Ohio, Oct. 7th, 1878.

THIS part of the great State of Ohio has been favored with the finest growing weather any country could be blessed with—all crops being above the average—during the whole season the rains seemed to come just when needed. Farmers are getting the following prices for their products: Wheat, 86c.; clover seed, $4; potatoes, 50c. per bushel; butter, 10 and 12½c. per pound; corn, 40c. per bushel; oats, 17c. per bushel; wool, 32c.; flaxseed, $1; rye, 45c.; and even at these prices, owing to the large surplus they have to market, they can lay up considerable money—even more than for several years. There is a large crop of apples in the county. Two jelly factories have started up to make fine apple jelly, by evaporating cider as it is expressed from apples. It is then shipped at a profit. DR. J. A. T.

LITTLE ROCK, Ark., Oct. 2.

WITH us, at the present time, every available hand is engaged picking cotton; the amount already picked and sent to market is greater than usual at this date, but the crop is light, not more than two-thirds of an average yield. Corn is good, one-fifth greater than any crop for five years. Wheat, owing to excessively wet weather, and heavy storms in the spring, was a total failure. Sweet potatoes have been injured by dry weather, and are light. Peaches rotted badly, and those which matured were injured by worms. Pears and apples did very well, but there are only a few of them in this vicinity. Grapes rotted badly, and those which matured were of inferior quality. Raspberries, where cultivated on soils suited to them, did well. C. C. B.

OXFORD Co., Ontario, Canada, Oct. 5, 1878.

THE month of September was noted, in this part of the country, for very heavy rain storms, doing considerable damage to roads and bridges and putting a sudden stop to fall seeding, the ground being too wet to work. Grain is yielding badly. Fall wheat averages about 20 bushels per acre. Spring wheat is a complete failure; it will yield scarcely eight bushels per acre. Barley is very poor. Oats are fair and so are peas. Potatoes are very poor; crop selling at 75 to 80 cts. per bushel. Hay is good. Fruit abundant and good; apples are selling at $1.05 to $1.25 per barrel; pears are good, worth $1 per bushel; grapes were badly injured by spring frosts. W. R. V.

BROOME Co., N. Y., Oct. 5.

THE winter wheat crop around here was a fair one, but considerably lighter than that of last year, on account of the Hessian fly and hot weather. Of spring wheat there was no crop at all—many did not get their seed back. Oats are good, but worth only 20 cents per bushel. Potatoes are a very light crop. Corn is good, better than usual. Apples are a very heavy crop on the hills, but light in the valleys; but the best grafted fruit will only bring 25 cents per bushel. Peaches are a very good crop. All kinds of roots are light. Wheat is being sown very late this fall around here, except mine, which was sown Sept. 8, and looks well now. W. H. B.

BROWN Co., WIS., Oct. 7th, 1878.

WEATHER has been very wet for some time and farmers cannot plow except in favored spots. As it is useless to try to grow wheat hereabouts, except on fall plowing, we are getting a little anxious. Many are not yet through thrashing, and the grain is so wet that it is slow and awfully nasty work. Corn husking and potato digging are now the order of the day. Corn is a fair crop but potatoes are nearly a failure. In our local markets spring wheat sells for from 85c. to $1; red winter wheat, 88c.; rye, 45c.; peas, 50c.; Oats, 28c.; barley, $1.05; corn, 55c.; and potatoes, 60c. VAN.

ITHACA, N. Y., Oct. 8th, 1878.

APPLES are very fine and abundant, but prices are low, ranging from 15c. to 35c. per bushel, for No. 1 Kings. Wheat is looking well, but needs rain. The Hessian Fly does not appear to be doing any damage as yet. All the wheat in this locality was sowed late, and most fields have received extra preparation and extra manures — much superphosphate being used. All appear to be trying to get strong, healthy plants in the least possible time. One man sowed, last year, Oct. 5th, and cut 84 bushels from two acres. J. P. R.

JEFFERSON Co., N. Y., Sept. 27, 1878.

CORN here is a heavy crop and is well ripened. Early potatoes are nearly a failure; late potatoes fair, selling at 50 cts. per bushel. The hay crop was good; fall feed is abundant. Oats and spring wheat are rather below an average; winter wheat was heavy, yielding, in many cases, 40 bushels per acre and, in one instance, over 60 bushels per acre. This fall there is a much larger amount of winter wheat sown than usual; the Clawson appears to be the favorite variety. We have not yet had sufficient frost to kill tomato vines. G. B. P.

A CORRECTION.—In our issue of the 5th inst. a crop report from Argyle, Washington Co., N. Y., states that the potato crop thereabouts was nearly a failure, and that the *farmers* were poorer than our correspondent had ever seen them. He has just written us that, instead of the word farmers, potatoes should be substituted. We are glad that circumstances justify this correction, for, although it is unfortunate that the potatoes should be in a bad condition, it would be much more unfortunate were farmers in the same plight.

CRAWFORDSVILLE, Washington, Co., Ia., Oct. 7th.

TIMES hereabouts are hard, and money hard to raise. Wheat was a medium crop of fair quality. Oats are extra good; but of not more than an average yield—perhaps 40 bushels. Corn is badly blown down, partly caused by

grubs eating the roots. Hay is a large crop, and it was saved in good order. Potatoes are a poor crop. J. H. M.

BURR OAK, Ia., Oct. 5th, 1878.

THE wheat crop over a large section of northern Iowa and southern Minnesota is nearly a total failure. There are thousands of acres not cut, and a great deal of what was cut does not pay for harvesting and thrashing. Oats are rather a light crop; corn a trifle extra good. Cattle and hogs are cheap; farmers all feel poor. H. O. B.

POQUONOCK BRIDGE, Conn., Oct. 2, 1878.

CORN was largely planted hereabouts, and a good crop is nearly ready for the harvest. Potatoes are a fair crop. Apples are middling, both in quantity and quality; the majority of orchards are badly infested with the codling moth, causing the fruit to fall prematurely. M. W.

LAWRENCE, Van Buren Co., Mich., Sept. 25.

SEEDING hereabouts is almost over. Corn is from fair to good; wheat was a good crop, averaging 20 bushels per acre. Potatoes are poor in this section, owing to bugs and blight. F. E, C.

The Querist.

ANSWERS TO CORRESPONDENTS.

Ground Bone, Phosphate of Lime and Superphosphate.

R. C. Ellington, Henry Co., Ohio, inquires, 1. What are the fertilizing ingredients in bones, phosphate of lime and superphosphate? 2. What is the difference between the three? 3. How is superphosphate prepared? 4. What are the chief sources of phosphate of lime?

ANS.—1. The chief fertilizing ingredient in bones, phosphate of lime and superphosphate, is the phosphoric acid they contain; of considerable, though of less importance, are: 1. The nitrogen contained in the organic matter of bones, which is preserved in bone superphosphate made from raw bones. 2. The lime in the phosphate and carbonate of lime which, in both cases, is converted into sulphate of lime or gypsum in the process of making superphosphate. 3. The small proportion of magnesia which serves as a base in the phosphate of magnesia.

2. The difference between the three may, perhaps, best be shown by giving an analysis of each. The composition of bones varies somewhat according to the kind of animal from which they are taken, its age and their exposure to the weather; but raw, ground bones, such as are ordinarily employed for manure, contain about the following ingredients:

Phosphate of lime and magnesia	50	per cent.
Organic matter, gelatine and fat	30	" "
Water	10	" "
Carbonate of lime	6	" "
Sand and impurities	4	" "
	100	

Phosphate of lime contains:

Phosphoric acid	45 81	" "
Lime	54.19	" "
	100	

Superphosphate of lime contains:

Phosphoric acid	71⅓	" "
Lime	28⅔	" "
	100	

The superphosphate of commerce, however, contains several other ingredients, the proportion of which varies considerably in the product of different manufacturers, but, according to Pusey, the unadulterated article should contain about:

Soluble phosphate and superphosphate of lime	40	per cent.
Sulphate of lime or gypsum	20	" "
Animal matter	20	" "
Water	20	" "
	100	

Of this, according to Ville, from 15 to 18 per cent. should be phosphoric acid, while Prof. Johnson puts the amount at 24 per cent.

It will be seen, therefore, that bones contain, in addition to phosphate of lime, a small proportion of phosphate of magnesia—a valuable fertilizer—a considerable quantity (from 2 to 4 per cent.) of nitrogen—for most crops the most valuable of all fertilizers—and six per cent. of carbonate of soda—which is insoluble in water, and therefore of no use to plants unless decomposed by the other ingredients in the soil. The phosphate of lime in the bones is very slowly soluble in water, but the more finely the bones are ground, the more accessible are the particles to the decomposing action of the other ingredients of the soil, and consequently the more quickly is the phosphate rendered soluble, and thus made available as plant food.

3. Superphosphate is made by treating either raw, steamed or burnt bones finely comminuted, with diluted sulphuric acid. The proportion of acid most desirable to employ depends on the state of the bones and the strength of the acid. Steamed and burnt bones require less than those that are raw and the more finely all kinds are ground and the purer the acid, the less of it will be needed. The pure concentrated acid has a specific gravity of 1.830 to 1.850 and from this standpoint the relative strength of the article to be used can be ascertained. Of the kind generally sold it would require at the rate of 52 pounds of the acid to convert 100 pounds of phosphate into superphosphate; or, in other words, a trifle over one-half the weight of bone is the proportion of acid required to accomplish the desired end. The quantity of water with which the acid should be diluted varies with the method of manufacturing, but it is a safe rule to add to it twice its bulk of water before mixing it with the bone. The sulphuric acid at once attacks the carbonate of lime, decomposes it, liberating the carbonic acid and uniting with the lime, in proportion of 46.51 parts of acid to 32 56 of lime, takes into chemical combination 20.93 parts of water and all together form sulphate of lime or gypsum.

Having thus got rid of the small proportion of carbonate of lime in the bone, the acid attacks the phosphate of lime, having a greater affinity for the lime combined with the carbonic acid than for that combined with the phosphoric acid. Taking away from the phosphate of lime two-thirds of its lime, it combines with the latter in the same proportion as with the lime from the carbonate of lime, and, in the same way, forms gypsum, while the one-third of the lime still remaining combined with the orginal proportion of phosphoric acid, forms a new combination known by the name of biphosphate or superphosphate which is readily soluble in water, and which, united with the gypsum from the carbonate and phosphate of lime, the organic matter, water etc. which were in the bones, constitutes the bone superphosphate of commerce. The methods of preparing it at the different factories vary somewhat, but the principles and processes are here briefly condensed.

4. Until recently all the phosphate of lime used for agricultural purposes was of organic origin, derived from bones; but of late the use of phosphate from mineral sources has been rapidly increasing until it is not improbable that in the world to-day more of the latter is used than of the former. The chief sources of mineral phosphate of lime are: 1. Apatite, or phosphorite, which was first discovered in Cornwall, Cumberland, and many other parts of England, but later has been found abundantly in Germany, and in many other parts of Europe. It usually has the form of six-sided prisms of a greenish color, and contains a varied proportion of phosphoric acid, from 7.2 to 26 92 per cent. according to Prof. Way, and Dr. Gilbert. 2. Coprolite, the petrified dung of extinct animals, chiefly carniverous reptiles, first found in Suffolk and Norfolk, England, and since then in many other parts of the world. Some of this analyzed by Prof. Henslow, contained from 40 to 60 per cent. of phosphate of lime; while Prof. Way found in other specimens 29.87 per cent of phosphoric acid, equal to 81.30 per cent. of bone earth phosphate. 3. Phosphoric rock found very extensively in South Carolina, also in the chalk formation in the south of England, and probably elsewhere. A good deal of this contains about the same proportion of phosphate of lime as bones do, but like all the other phosphoric minerals, it is, of course, destitute of any nitrogen. 4. Mineral bone earth found in Estramadura, Spain, in pure specimens of which Dr. Daubeny and Capt. Waddington found as much as 37 per cent of phosphoric acid. 5. Many phosphoric marls also yield phosphate of lime in different proportions.

Before these substances are used, they are, as a rule, either reduced to powder and used as ground bones; or, better still, treated with sulphuric acid, so as to form superphosphate of lime. The resultant preparation is reported to be generally as valuable a fertilizer as commercial superphosphates, the influence of the nitrogenous ingredients of the latter on certain soils having been deducted. This mineral superphosphate is also used in combination with bone superphosphate and the resultant preparation is highly spoken of. The following is an analysis of a good mixture of the kind.

Soluble phoshate of lime	22 to 25	per cent.
Insoluble phosphate	8 " 10	" "
Water	16 " 13	" "
Sulphate of lime	35 " 45	" "
Organic matter	12 " 15	" "
Nitrogen	0.75 " 1.5	" "

The Cabbage Fly.

W. B., Heart's Content, Newfoundland, says: "During the present summer in nearly all the gardens round about here, the cabbage and cauliflowers have been destroyed in large numbers by a white maggot that eats away the roots. The maggot appears to be of the same species seen in putrid meat etc. Lime and soot don't seem to have any effect upon it. It can hardly be the manure that has conveyed the pest into the land, as I have used guano only this year on one plot; and they appear as bad there as in other parts of the garden where stable manure was used. Is there any remedy, or if not, how can I prevent it from doing mischief next season?"

ANS.—The white maggot is evidently the larva of the European Cabbage Fly, an insect now widely distributed in this country, and well known in many localities from the amount of damage it has done.

This Cabbage Fly (Anthomyia brassicæ) is an ash-gray, two-winged fly, resembling the common house fly, but a little smaller. The body is covered, though not very thicky, with coarse, black bristles. Besides these the body has several black marks which are arranged as follows: one on the head; three stripes on the thorax, running lengthwise along the body; and one longitudinal stripe on the abdomen, with black transverse stripes between the joints. There are two other closely related species in this country, the Onion Fly (A. ceparum) and the Radish Fly (A. raphani) that are injurious insects very closely resembling this one, besides a number of other species of whose early history but little is known.

The female fly deposits, on the plant, eggs which produce maggots that resemble those seen in putrid meat, save that the large end of the body is flattened and somewhat fringed or margined along the sides with minute teeth. These bore into and erode the roots of cabbages and cauliflowers from the time they are set out as young plants till the time to harvest them in the fall, if they do not appear in such numbers as to kill the plants earlier. Successive broods follow each other as the older reach maturity, and consequently they are not carried to the ground in the manure. A comparison of these maggots with those found in stable manure would have shown that they were different. When the maggot reaches maturity it changes to a chestnut-brown chrysalis in the old maggot skin. After remaining dormant in this state about two weeks, the fly, or perfect insect, emerges.

Where these flies have become so thick as to do considerable damage in a large community, extermination cannot be well attained without a concert of action on the part of all in the community, which it is presumed is next to impossible. Sifting fine tobacco on the leaves has been recommended as a preventive remedy, the dust being so distasteful to the fly that she will not alight on the plant to deposit her eggs. This may be in the form of Scotch snuff, and should be repeated as often as the wind or rain removes it. It is possible that a solution of carbolic acid in water, weak enough not to kill the plants, if poured round the roots, may destroy the pests.

How to Register.

W. C., Jr., Trappe, Talbot Co., Md., inquires how to get a bull out of an imported cow and by a registered bull, registered.

ANS.—We presume he has Jersey stock which is usually spoken of as registered; breeders of other kinds of cattle say recorded in the Herd-book or, recorded, simply. Now, it may be that the progeny of a registered bull, though out of an imported cow, cannot be registered in the Herd Register of the American Jersey Cattle Club, but that is hardly probable. The dam must, however, first be registered, and to do this there must be documentary evidence of her importation, naming the importer, the ship she came in, the port she landed at, and the date of importation. Blanks are given to be filled out and verified. After this, her progeny by registered bulls may also be registered, provided they can be described, the date when dropped given, the breeder named, and the present or last owner named. It costs $3 each to register living animals, $1 each to register dead ancestry. Application for blanks may be made to Col. GEO. E. WARING, Secretary of the Jersey Cattle Club, at Newport, R. I.

Club-root in Cabbages.

L. N. R., Petersville, Pa., asks for a remedy or preventive of Club-foot in Cabbages.

ANS.—This evil is due to the Anthomyia brassicæ or Cabbage Fly, treated of in another part of this department. In addition to the remedy there suggested, Dr. Harris recommends that boiling water should be thrown on the infested plants, a treatment which, according to him, will kill the larvæ without injuring the plants. This, however, has not proved a satisfactory remedy. Another preventive is never to grow Cabbages two years in succession in ground on which this disease is liable to occur. It is found that plants raised in soils rich in lime are but little affected by Club-root, and on this account, as well as from actual experiments with the use of lime on other soils, there is little doubt that lime acts as a check on the insect. The most effective way of using it, according to some, is to apply about a tablespoonful of caustic shell-lime to each plant, by removing a little earth from around the stem, putting on the lime and then replacing the soil. If a little bone-dust is scattered over the plant it will add to its chances of freedom from the pest.

Miscellaneous.

Z. B. Wheeler, Bibb Co., Ga., inquires where he can purchase oil-cake for his cows.

ANS.—Cotton seed-cake can be bought, by the ton, of pressers in New Orleans, Memphis, Atlanta, and almost all large Southern cities. In many of the smaller towns, too, there are makers of cotton-seed oil and cake. Linseed cake can be had of pressers in Louisville and St. Louis and in other places. Both are usually for sale in the feed stores of large towns, and if these haven't them on hand, they will procure them to order or refer an inquirer to the next dealer of whom they can be had. It is always best to purchase such goods as near home as possible, to save freight, and we do not know any dealers in them in the neighborhood of our correspondent. The decorticated (hulled) seed cake is the best for cows. Feed from half a pint to a pint of the cake (ground) in a quart of corn-meal twice a day to each cow.

A Subscriber, Norfolk, Va., says that he has lost his entire crop of Swedes by the ravages of ants that gnawed the roots as soon as the leaf had attained much size, and he asks whether there is any remedy or preventive.

ANS.—The details given here are not sufficient to enable us to come to a satisfactory conclusion as to the insect enemy that has destroyed this crop. It is not likely that the loss of the turnips was due to ants; but their presence indicated that other insect enemies were there at work. Some dipterous insects, as the flower flies (Anthomyiadæ), in the larval state, infest the roots of turnips, etc., eating also the pulpy parts of the leaves and stems.

P. H. R., Clarence Center, N. Y., asks where can dynamite be purchased; how is it sold, and if it is sent by mail.

ANS.—Dealers in this explosive, here in New York, will not retail it to people in the country, owing to the difficulty in sending it to them. The U. S. Mails do not carry explosives, and even express companies do not care to carry small occasional packages of this one. The best way in which those living in the country can procure it, is through the nearest dealer in guns and gunpowder. If these haven't it on hand, and they rarely have, they can in most cases procure it much more easily than those not in the trade.

Van, Brown Co., Wis., asks what is the best grass or grasses for a wet pasture, where much of the natural growth of timber is still standing—soil, a black loam on clay subsoil.

ANS.—June-grass (Poa pratensis) and Red Top (Agrostis vulgaris) are best suited for such situations; but if "much of the natural growth of timber is still standing," a large or even a good crop cannot be expected.

Mrs. H. E. Faulkner, Waukesha Co., Wis., Asks whether Glaucium luteum is an annual or perennial; hardy or not.

ANS: Glaucium luteum is a hardy perennial.

Mrs. Geo. B., Chula, Va., says she has two plants of Eryngium Leavenworthii grown from seed sent her by the RURAL last spring, and she does not know whether they will bear winter out-of-doors in that locality or whether it would be necessary to remove them into the house. They show no signs yet of blossoming.

ANS.—Eryngium Leavenworthii is an annual. Its leaves and inflorescence turn at this time a bright purple of striking beauty and they may be preserved for winter bouquets for a long time. Our friend must refer to some other plant.

Walter Severly, sends a small piece of a plant given to him as "Egyptian Corn" but which he knows to be some sort of Sorghum, and he wishes to learn whether it is a common variety.

ANS.—The specimen, is without any doubt, a variety of Sorghum vulgare. There are several varieties of this, however, so closely resembling each other that it is impossible for us to tell to which sort so small a specimen belongs.

Allen and Voice, East New York, L. I.—The plant is Fucus vesiculosus, belonging to the Algæ family. It is sometimes called "Bladder-weed," "Sea-weed," "Sea-wrack. It is easily known by its olive color when fresh and its strap-shaped, branching parts, bearing air-bladders, here and there, by which it is floated in the water. It is used for manure and also for the manufacture of kelp and as a source of iodine. It is tough and leathery, somewhat like India-rubber.

A. M. C., Savannah, Ga., asks: (1.) Why are the holes of flower-pots covered with a shell or piece of pottery?

ANS.—The hole in the pot without which the water would become stagnant, is for drainage. The piece of crock is to prevent the soil from clogging it.

(2.) Will wooden kegs in which paint has been contained, injure plants?

ANS.—No; not if dry.

K. D. A., Tecumseh, Mich., asks how to treat Verbenas when taken from the garden and placed in the cellar, and what care should be given them through the winter.

ANS.—If placed in soil and kept moderately dry in a cold cellar—though not so cold as to freeze—they will winter very well.

W. H. Mann, Camden Co., N. J., asks how he can rid his Cauliflowers of worms.

ANS.—By pouring upon them nearly boiling water. Or see other answers.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY OCT. 19, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

THE PIG IN AGRICULTURE.

The pig has recently been spoken of in contempt when compared with our other domestic animals. But if we examine his good qualities at all critically, we must award him a high place in our agriculture. The American people are thought to consume more pork, bacon and ham per capita, than any other people. The products of the pig are a household necessity, and enter into almost universal consumption. If we suppose 75 lbs. per capita to be used by our people of pig products, including lard, then our home consumption amounts to at least 3,000,000,000 pounds, worth $150,000,000. The pig then holds a conspicuous place in the food supply of the nation. But when we examine it as a factor in our exports, we find it to stand at the head of all our domestic animals. A few years ago we did not put up our hams and bacon to suit English taste, and our average export of these articles amounted in money to only $6,000,000 annually. But after studying the taste of our principal customer, and getting the assistance of some English houses in putting up the goods, our exports of hog products rose in 1872 to $21,000,000. During the fiscal year 1876 these exports were as follows:

Live Hogs	$679,042
Bacon and Hams	59,664,456
Pork	5,744,022
Lard	22,429,485
Lard oil	149,156
Total	$68,666,161

In 1877 these products reached the sum of $82,352,222, an increase of over thirteen millions in a single year. But the items of the last fiscal year, ending June 30, 1878, were the following:

Live Hogs	$267,259
Bacon and hams	51,750,205
Lard	20,014,023
Pork	4,913,646
Lard oil	994,440
Total	$87,939,573

Now, the entire cattle products exported the same year amounted to $49,338,029; and this includes all our meat trade and dairy products, the latter being $18,162,487; so that the exports of our dairy products, amount to but little more than one-fifth as much as those of our pig products, and the whole cattle exports only amount to 56-100 of the pig exports. These export figures of pig products show what we may do in a few years more. They have doubled in less than ten years, and we may reasonably expect them to reach $125,000,000 during the next ten years. We have ample resources for growing and fattening pigs in unlimited numbers and can supply the demand however much it may increase. And since we can produce pork, bacon and hams cheaper than any other country, we are likely to have the command of the markets.

The pig is found to produce a pound of product from less food than either cattle or sheep, and therefore is the most economical machine to manufacture our great corn crop into marketable meat. Our people are becoming wiser every year, and exporting less, proportionately, of the raw material and more of condensed product. If it takes seven pounds of corn, on an average, to make a pound of pork, as is no doubt the case, the farmer begins to see the great economy of exporting one pound of pork, bacon or ham, instead of seven pounds of corn. The difference in cost of freight makes a fine profit, of itself; besides the pound of meat is usually worth more than seven pounds of corn in the foreign market.

The production of pork should be encouraged on the further consideration that it carries off less of the valuable constituents of the soil than beef. The fat pig contains only three-fourths as much mineral matter per cwt. as the fat steer, and only two-fifths as much nitrogen per cwt. And therefore the production of a ton of pork on the farm will carry off only a little more than half the fertility carried off by a ton of beef; besides a ton of beef will require nearly fifty per cent. more food to produce it. This gives, in round numbers, the comparative effect of producing pork and beef.

It is thus evident that the pig should have a high place in our agriculture; should be fostered in every way—his capabilities studied and pushed—his diseases carefully noted and prevented, for he is the most profitable meat-producing animal on the farm. The pig is an excellent adjunct to the dairy, turning all the refuse milk, and even whey into cash. As he is king of our meat exports, so let us treat him with great consideration.

GROWING MUTTON.

Agriculture in the United States seems to be developing, growing in all its departments. No country has equal resources for the expansion of its agriculture, and none more urgent inducements. With immense tracts of land well adapted to the growth of wool and mutton, we imported, for the ten years including 1870, an average of fifty million pounds of wool per year, at an average cost of $7,959,546 per annum; and for the next five years, including 1875, 74,000,000 pounds per year, at a cost of $15,146,716; but for the past three years, the importations of wool have fallen to 45,037,702 pounds, at an annual cost of $7,922,525; and this notwithstanding our increase in population.

Our importations of woolen goods for the five years ending with 1875, average $47,595,397; and during the past three years the average has fallen to $28,047,293. The statistician of the Department of Agriculture makes the whole importation for 55 years, from 1820 to 1875, of woolen goods, amount in the aggregate, to $1,165,542,084, or $21,191,674 per year. Thus it will be seen that the value of the yearly imports of these goods for the past three years has been but little more than that of the average annual imports for the whole period, which shows that our sheep industry is getting into a healthy state.

On our broad plains, sheep must be kept almost wholly for their wool. Here the capital invested in land is exceedingly small, and the cost of the business consists in the cost of the initiatory flock and the wages of herders. And as it needs but one herder to 500 or even 1,000 sheep, the expense is not large, and a low price of wool will afford ample margin for profit. In this way we produce many millions of pounds of cheap wool in Colorado, Nebraska, California and Texas. This is all needed, and its growth should be encouraged as long as these conditions continue; but we require a large increase in the production of wool in the older States, in order to supply our manufactories, and it has become a well settled fact that sheep husbandry cannot be made profitable on high-priced lands, if kept simply for the wool. This is undertaking to carry on an industry and throw away half of its legitimate earnings. Under favorable conditions the mutton will produce as much income as the wool. England, on a territory only about equal to the State of New York, carries eighteen millions of sheep, and the United Kingdom, with 122,000 square miles, carries a few more sheep than all the United States. But upon her expensive lands sheep husbandry is developed in all its branches. Nothing goes to waste. Bakewell and those who have followed him, have developed several breeds of mutton sheep, that mature early and produce mutton of the highest quality, heavy weight, and lambs that bring $10 or more each, when six months old. The wool, as an item of profit, is secondary to the mutton. But a heavy, fat carcass, is always accompanied with a heavy fleece. To obtain the mutton there is no curtailment of the wool.

The older States must now renew their sheep farming on similar principles to those adopted in England. We may not, at once, put into operation her admirable system of turnip culture, but we have large amounts of surplus grain of the best quality, for feeding sheep. We export annually about three hundred million pounds of oil-cake which Great Britain uses to perfect her mutton and beef, and enrich her soil. This should all be used at home, and will produce more value to export in meat, besides adding largely to the fertility of our depleted soil. Our great crop—Indian corn—is almost too rich in carbonaceous food, too heating to the animal system to be fed alone, but when mingled with a small proportion of oil-cake, it produces rapid fattening of sheep, and keeps them in excellent health. Then, we have a great resource in decorticated cotton seed-cake. This may be produced in very large quantities. These oil-cakes should be used chiefly for the increase of oil and albuminoid elements in food. The grasses are our great reliance for growing mutton as well as beef, and a proper system of farming will produce these in all our early settled States.

A CHANCE FOR FAME AND FORTUNE.

What a blessing it would be if some means were devised by which the farmers of the country might learn beforehand the area devoted in every district to each particular kind of crop! It is among the possibilities of the enlightened and systematized agriculture of the future that information of this kind will be within the reach of every inquirer. In those days it will, as a rule, be due to one's own folly if he finds any particular product a drug on his hands on account of an overstocked market. Now-a-days, however, a loss of this kind is often an inevitable misfortune even to the most prudent and far-sighted farmer or horticulturist. Last year potatoes were unprofitably superabundant in many sections, and this year again tomatoes are too plentiful for profit in not a few places. In the neighborhood of this city the crop has been so heavy and the prices consequently so low that, in many instances, it has not paid to pick and market them and they have been allowed to rot on the vines. This excessive supply is the more disastrous owing to the perishable nature of the fruit and its unfitness for exportation. Our surplus stock of potatoes and of most other farm products, can be sent to a profitable market in other countries, but all our tomatoes must be used or wasted at home.

A large demand for this kind of produce has arisen of late years across the Atlantic, and the demand is yearly increasing very disproportionately to the supply. There are very few articles that could be more profitably shipped to London than a consignment of tomatoes, if such a consignment could be made with safety. In view of the great popularity which this product has attained among us within the last half century, it is fair to suppose that a wider acquaintance with its merits among our trans-atlantic cousins and other Europeans, would be attended with a similar result, and consequently that American-grown tomatoes would there constantly find a highly profitable market. To insure this very desirable end, all that is needed is a variety that can be safely exported. One of the straightest roads to fortune is to find out some unsatisfied need of society, and then to devise the means of supplying what is lacking. Here we point out to our friends just such a need, and invite the skillful and enterprising horticulturists among them to compete for the fame and fortune that must come from satisfying it. In view of the vast improvements which have of late years been made in the tomato, surely it will not be unsurmountably difficult to produce a variety suitable for shipment.

MILK AND WATER.

The frequent exposures of the petty cheating practiced by milk dealers who are detected in watering milk, give a very low, miserable exhibition of human weakness. That the paltry gains made in this way should be sufficient to induce a man to commit so mean an act, is sad to contemplate. It is true that the supposed difficulty of detection adds greatly to the temptation; but when the delinquent milk-dealer or dairyman supposes detection of his mean dishonesty to be difficult, he makes a serious mistake. The truth is, there is nothing easier to detect than adulteration of milk. Milk is a standard substance of so regular a composition that the addition of a small portion of water to it or the subtraction of a small quantity of cream from it, can be detected as easily as the addition of water to oil. If this were well known, as it should be, by all who handle milk, the inducement to become rogues by the false security hitherto felt, would no longer operate; and there would be less of this cheating.

It is a stigma upon farmers generally, who are supposed to be honest by breeding, and to be unused to the ways that are dark, which are looked for more in the city streets than in rural and sylvan abodes, that some of them should fall into the evil ways of the city dealers and practice knavery upon the factorymen. "Patrons" the factorymen call them! but from such patronage as that, one would wish to be delivered. In a country paper there was recently published a list of "patrons" who were fined for watering milk. One of these men was fined last year and on this occasion was glad to pay $150 to be released. Wise man! he immediately sold his cows and retired from the business of "patronizing" the "Swiss Creek" factory. The whole farming community suffer from these delinquencies. "An honest farmer" is now coming to be used as a sarcasm; in irony, rather, for what the words purport. Are there no honest farmers any more? Verily the milk business, the fruit business, and the baled hay business in which "watering," and "veneering," and "padding" with cordwood, are so frequently practiced, would lead one to suppose that honesty has become an old-time and forgotten virtue. But we don't believe it yet.

BREVITIES.

Bank up the celery.

"Gather your Rose-buds while you may."

Of all the breeds of chickens we have raised this season, the Plymouth Rocks mature and lay the earliest.

"The brown leaves rustle in the wind,
And golden is the oak tree's crown;
The red beech drops her ripened mast,
And chestnut's husks come showering down."

If you want a vigorous, quick-growing, hardy, handsome shrub that will flourish in almost any soil or situation, for twenty-five cents each, buy the California Privet, Ligustrum ovalifolium.

Col. Weld tells us that his Dioscorea batatas, which has matured seed, also bears bulblets in the axils, like the male vine, so that nature is not so economical in this instance as we gave her credit for being.

A number of our friends have sent us plants this season by mail, and have then informed us of the fact by postal-card. Sometimes we cannot tell which plants and postal-cards go together. It is the same with specimens sent for name.

Mr. Basset (France) has been studying for "more than a quarter of a century" to discover a means of obtaining ammonia, at a low price, from the nitrogen of the air. Mr. Basset announces that he has arrived at complete success. We congratulate Mr. Basset (!)

Pelargonium Distribution.—We would say to our lady readers that the last of these orders are now being filled and mailed as we go to press. Not one was omitted. Those therefore who do not receive them will look to the P. O. or to imperfect directions. Of all the applications, one had no name, ten defective addresses, and several we *could not* make out.

Not until too late to rectify the oversight, did we discover that the sectional drawing explanatory of the article under Notes from the Rural Grounds, was incorrect in one particular, viz.: the drainage-hole of the inner pot is made to extend through the bucket. It would have been rather a difficult thing to have made the buckets hold water with that hole in the bottom

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

DAISIES.

BY ALICE J. ROBERTS.

I

Not ever by the wayside,
Where a common world has trod,
Soiled by taint of earthly contact,
Looks the daisy up to God.

Far away in fragrant meadows,
Where the cooling breezes pass,
Sighing with a dreamy music,
Through the tremulous, wavy grass,—

Where the rose and gold of morning
And the pearly twilights fall,
Radiant in her dewy splendor,
Grows the daisy fair and tall.

II.

Not alone where toil and conflict
Show the prints of busy feet,
And the great heart-tide unceasing
Ebbs and flows with restless beat.—

Far away where lonely beauty
Starlight pale is shining through,
In a holy revelation,
Hearts grow swiftest toward the blue.

Many a thought is born of silence
And the gloom of weary hours,
Reaching up to God and heaven,
Like the whiteness of the flowers.

[*The Watchman.*

HOLLYHOCKS.

BY ADA IDDINGS GALE.

In a garden wide and pleasant,
Where doth blossom all things sweet;
Lillies, pansies, sweet rosemary.
Springing up to meet your feet,—
Grows a wondrous stately flower,
Princess of that garden bower.

O'er it wild bees kiss and linger,
Lady-bugs go strolling there;
Tall it stands in stately splendor,
Swaying blossoms in the air;
A dozen blooms upon its stock,
Sweet old-fashioned hollyhock.

Blooms as bright-hued as the fire,
Side by side with blooms of snow;
Crimson like the sunset sky,
Pink to match some cheeks I know;
Thy blooms might kingly splendor mock,
Sweet old-fashioned hollyhock.

[*Inter-Ocean.*

AUTUMN FASHIONS FOR CHILDREN.

Materials and Trimmings.

A NUMBER of ladies have written requesting me to publish models of coats, polonaises and costumes for little girls, and, in response, I give this week the latest styles for misses and children.

The older girls will wear velours and other rich fabrics worn by ladies, but for misses less expensive goods are used. Most mothers will rejoice that plaids are again in vogue. Those in all-wool materials are the best of investments. They do not become "shiny" or "show dirt," they wear for a fabulously long time, and after being discarded for costumes, they can be utilized as linings for cloaks and circulars and for many other purposes.

6303 6303

The greatest possible variety is shown in plaided goods, from the most gorgeous combinations to those so extremely subdued, as to be best described by "dingy." The popular fancy seems to incline to the dark plaids. Checks and partial or imperfect checks share the popularity of plaids. The checks come in dark-blue, gray and garnet, striped with white wool or silk. Basket cloths are again included among the seasonable fabrics approved by fashion, the most prominent shades being bronze, olive, bottle-green, prune, iron-gray, and dust-brown. Some of the clear blue shades among basket woolens make handsome costumes for girls. French merino and India cashmere make serviceable dresses for the little folks. Camel's-hair cloths are also to be included in the list of materials for children. Any ladies who may desire samples of dress goods with prices, can be supplied by addressing me, care of RURAL NEW-YORKER. Be careful to state what line of goods you want. The trimming for children's garments consists for the most part of bands, pipings, pleatings, or folds of silk, or satin velvet, and galoons, disposed according to the taste of the dressmaker.

DESCRIPTION OF CUTS.

Fig. I is a "washerwoman" costume, composed of plain and plaided materials. The combination as shown in the cut is very pretty, but some ladies may, perhaps, prefer less of the plaided goods; if so, the overskirt may be made all of the dark fabric and trimmed with folds of plaid. At the back, the overskirt consists of a back breadth, at each side laid in backward — turning plaits over the lower portion of which is arranged a *revers*. This cut is published to please those ladies who wanted to know how to use plaids in this style of costume.

6304 6304

At Nos. 6306, 6353 and 6355 are shown polonaises suitable for girls from eight to fifteen. Camel's-hair or basket-cloths, merino, cashmere, lady's cloth or plaided goods may be used with these models. Price each, 25 cents. Nos. 6300 and 6308 are costumes for girls under nine years. In 6300, the body of the dress can be made of silk and the kilt of cashmere; or the whole may be made of cashmere, and the sleeves, cuffs and Carrick collar of silk.

The skirt of 6308 is slashed from the bottom of the garment to the termination of the dart seam, and the back edges of the back are faced with the goods and closed with buttons and buttonholes from the neck to a point corresponding with the top of the opening. The edges of the opening and the remaining edges of the back, are piped with a light color, the back then falling in modish tabs over a narrow breadth of darker goods. The vest should be of dark goods piped with the light color and ornamented with bows. Silk, cashmere, and camel's-hair are suitable for this pattern. The garment needs but little decoration. Lace, folds, braids, galloon bands, or plaitings make pretty trimming for it.

No. 6307 is a girl's polonaise, which would look admirably with a kilt-pleated skirt. Any material may be used in its construction. Price of either 6300 6307 or 6308, 25 cents. A misses' kilt skirt and scarf are shown at No. 6337. A pleated blouse with a yoke or a cutaway coat would be handsome to wear with this skirt, as would also any style of over-skirt or paloaise, for which addition the scarf would need to be omitted. Any of the dress goods in vogue may be employed for the formation of the skirt, and the scarf may be of the same fabric in a uniform or contrasting shade, or of silk, velvet, satin, brocade. Pleatings, folds, ruffles, lace or galloon-band will form appropriate garniture for the scarf. Price of pattern, 25 cents.

Fig. 1.—"WASHERWOMANS" COSTUME.

The girls' sailor costume (No. 6361) is charming for little girls. Blue flannel or cashmere combined with some of the new plaids will make a jaunty-looking costume of this. If preferred embroidery, lace, braid or galloon may be used.

No. 6303 Misses' double-breasted cloak and No 6320 is Misses' coat with *revers*. The different styles are sufficiently indicated by the cuts.

These cloaks can be made of suit goods or cloth, cashmere, silk or velvet, and trimmed with buttons, and velvet, braid, bands, folds passementerie or fringe as taste may dictate. Price of each of these patterns 25c. Nos. 6356, 6304, 6319 are models of out-door wraps for little girls. The patterns may be made up in flannel, suit goods or cloths, (diagonal cloths are especially pretty) and ornamented with bindings, braid folds or machine stitching and buttons. Price of either of these patterns 20 cents.

6319 6319

In ordering patterns, please state age of child (in case of an adult, give bust measure). Much trouble and annoyance results from ladies not stating exactly what they want. All patterns sent from this office are accompanied by printed slips giving full directions for making the garment.

FAITH RIPLEY.

A FEW ANNOUNCEMENTS,

BY THE EDITOR.

ABOUT the 16th or 23d of November, I shall publish cuts of fall styles in out-door garments and hats for ladies, and a little later will give the newest designs in street and house costumes, with an account of the most fashionable fabrics for fall and winter wear.

A number of answers to correspondents have been crowded out this week for want of space. If the ladies will have patience for a week, I shall take pleasure in answering their queries in RURAL of 26th October.

IN next week's issue I will publish some new designs in fancy articles—hair-pin receivers, pen-wipers, wall-pockets, pin-cushions, etc.—suitable for gifts or for fairs, and this will necessitate the postponement of the paper by Mr. Heinrich on ornamental grasses announced for that issue—An illustrated article on feather flowers, and butterflies, with explicit directions how to produce the novel and beautiful "feather bouquets" will appear in RURAL of Nov. 9.

6300 6300

All communications intended for the November Women's Club, must be received by me before the 25th of Oct. to insure their being in time.

SOCIAL POSITION OF WOMEN IN GERMANY.

BERTHA A. WINKLER.

THE social life of women in Germany is so complicated and varied among the different classes that it requires years of close observation and familiar intercourse to become thoroughly acquainted with those minute but important details which often escape the observation of travelers, who think that a flying trip through the country and a night in a ball-room are sufficient for a thorough knowledge of German life and society. Hence the vague and indefinite ideas of Americans regarding the women of Germany.

6307 6307

Among that class of aristocrats whose names are distinguished with the word "von" (denoting nobility) the women are perhaps the most enlightened and refined, though by no means the most useful or influential in society. Their lack of influence is undoubtedly owing to their natural shrinking from public gaze in any other capacity than ther feminine characteristics of weakness and clinging dependency; and their queer notions of birth and blood, those strong barriers, which keep them aloof from all social intercourse with those beneath them.

The halo of romance thrown around th eir noble ancestors in the days of chivalry still seems to envelop these women in the misty clouds of an ideal life and invests them with that mystery of romance which though peoulisrly fascinating to the ardent, soaring imagination of the poet, makes it difficult to associate them with the rest of the earnest practical world. This idea of German noblewomen seems to be universally entertained by the peasantry who, notwithstanding their bitter experience of cruel oppression and extortion from the arrogant nobility, regard these women with feelings of reverential awe little short of adoration. The deep respect and admiration which we are wont to entertain for the wives of our Presidents or for any other great lady is nothing compared to the enthusiasm manifested, and homage paid by a peasant o the wife of even the poorest nobleman.

6308 6308

A little incident which I witnessed may serve to illustrate the above: The Graefin von (Countess of) L—— was passing through E—— on her way to the castle. Upon being saluted by the peasantry with demonstrations of enthusiastic veneration, she stopped the carriage and making a few pleasant remarks to the bystanders, offered a silver coin to one of the little girls who, upon seeing the nature of the gift, shook her head with a decisive "Nein, nein, ich danke,"

The countess then offered her a cluster of finely-colored autumn leaves, remarking that she had gathered them herself. These the girl eagerly accepted, though she evidently had no use for them. And to this day, though the girl has merged into a full-grown woman, nothing is preserved more tenderly, or held more sacred, than the relic of withered, faded autumn leaves.

6306 6300

These tokens of revential deference are the more remarkable coming from a people with whom a titled lady has nothing whatever in common and who have little to hope for from the nobility, and because among her equals the lady is treated with no such marks of respect. There the veil of mystery is torn aside, and she stands among them an educated and refined but weak woman. As her social position depends entirely upon the rank and power of her nearest male relative, she has no individual authority. Society does not value a woman according to her individual merit, but according to the position of her husband. No matter how important and superior her talents may be, she cannot gain influence until he rises in power. In short, feminine worth and talent is swallowed up in masculine rank and wealth.

Quite a different picture of social life is presented by the commercial and professional classes. Here everybody lives as near on a footing of equality as the most liberal notions of propriety will allow. The cold formalities, and strict distinction between the sexes, observed among the nobility, is entirely dispensed with. The women, unhampered by the reigning frivolities of fashion; free from the haughty air of superiority which characterizes every lady of rank, possess that strength of character, that quick, natural intelligence and facility of expression which at once commands attention and respect. By her generous impulses, her natural warm-heartedness and genial good humor, she softens and humanizes the hard lot of the peasantry, and throws

6320 6320

even a ray of warmth into the frigidly cold circles of the aristocracy. Considering her large mental capacities, and her vigorous character no other woman in Europe is capable of exercising a more unlimited and wholesome influence over society. Her social intercourse is with the most intelligent and learned, and strangers who are apt to judge her social position by that of the titled ladies, will be agreeably surprised to see a learned Professor in deep and animated discussion with a lady on some scientific subject, or a prominent merchant listening to a lady's views on commerce with an earnestness and attention, otherwise only to be met with in a counting-room council of merchants. These facts are the more remarkable when we consider that in spite of her influence in society and the respect shown to her by the most profound thinkers of the day, she would not dare to utter the word "Emancipation" without risking her influence and reputation in society. Her talents and abilities are only recognized as long as she limits the exercise of these to her domestic and social affairs. But the moment she evinces any undue ambition for a wider sphere of activity, the Professor would take his hat and depart with the gentle hint that he hoped the next time he had a conversation with the madam, it would be upon the philosophy of cooking.

It may be added, however, that within the last few years very visible and encouraging changes have taken place in their social position. Whether it is owing to the late war with France which has occasioned a greater influx of travel and more intercourse with the people of the now powerful empire, or to our Centennial Exhibition, in which women took a conspicuous part, I do not know, but judging from several new events which occurred immediately after the Exhibition, including the publication of a woman's paper in Germany and its frequent allusions to the freedom and independence of American women, I am inclined to favor the latter supposition. At any rate, they seem to have imbibed some of the love of freedom and equality characteristic of American women and are anxious to break the iron yoke of custom. In this they have the hearty co-operation of men who, since having caught a glimpse of the high social position of American women, and the purifying, elevating influence they exercise over all classes, have changed their stern opposition to woman's advancement into an earnest desire to elevate the sex. The old spirit of German pride is roused, they are vexed to see a nation of such late growth eclipse them in enlightenment and progress. Society no longer sneers at the word "Emancipation." And we need but look at the increasing list of German female authors, to be convinced of the rapid intellectual development and the powerful hold women are gaining, as individuals in society.

Evidently a brighter future is dawning for our German sisters. Although in a country governed by the iron sceptre of hereditary monarchy, they can never hope for the unlimited opportunities and grand privileges offered among the free, self-governed people of America, they can, by degrees, elevate the tone of society.

HOME STUDY.

The Chautauqua Literary and Scientific Circle.

For the benefit of many inquirers who have addressed us in regard to "Home Study," we publish the following about the newly-formed enterprise designated the "Chautauqua Literary and Scientific Circle:" For a year back a few days of each session have been given to scientific and

6337 6337

literary subjects. But this year has seen the inauguration of the most important enterprise that the association has undertaken—the Chautauqua Literary and Scientific Circle for the Promotion of Home Study. It is a gigantic undertaking, as it aims to assist anybody desiring it, anywhere in the United States. It has the machinery and means with which to push forward the work, and it will give a powerful impetus to study and investigation. Annexed is a specific plan of work,

1. *Name.*—Chautauqua Literary and Scientific Circle.

2. *Objects.*—It is the aim of the C. L. S. C. to promote habits of reading and study in nature, art, science, and in secular and sacred literature, in connection with the routine of daily life, especially among those whose educational advantages have been limited, to secure to them the college student's general outlook upon the world and life.

3. *Plan.*—This end shall be promoted by individual study in the lines and text-books which shall be indicated, by local circles for mutual help and encouragement in such studies, by summer courses of lectures and "Students' Sessions" at Chautauqua, and by written reports and examinations.

4. *Membership.*—Members shall be received on application and registration, and continued on condition of success in examination. Forms of application will be provided.

6361 6361

5. *Course of Study.*—The course of study, to be hereafter announced, shall cover a period of four years. A tentative course for the first year has been arranged as follows:

1. Studies in English history and literature.
2. Studies in Greek history and literature.
3. Studies in Biblical history and literature.
4. Studies in astronomy.
5. Studies in the science of everyday life.

The following are the questions candidates for membership in the class of 1882 are required to sign:

1. Give your name in full.
2. Your post-office address.
3. Are you married or single?
4. What is your age? Are you between twenty and thirty, or thirty and forty, or forty and fifty, or fifty and sixty, etc.?

6356 6356

5. If married, how many children living, under the age of 16 years?
6. What is your occupation.
7. With what religious denomination are you connected?
8. Do you, after mature deliberation resolve to prosecute the four years' course presented by the C. L. S. C.?
9. Do you promise to give at least four hours per week, from October 1 to July 1, to the reading and study required by this course?
10. How much more than the time specified do you hope to give to this course of study?

Persons answering the above questions and forwarding them to the Rev. J. H. Vincent, D. D., Plainfield, N. J., by or before Nov. 1, 1878, will be enrolled on the first class of the C. L. S. C.—the class of 1882."

Literary Miscellany.

THE DISCARDED DAUGHTER.

IN FOUR CHAPTERS.

BY ELLEN HUNTER.

CHAPTER III.

"Thomas!"

The old servant touched his cap.

"Take my horse. I shall want him at nine."

John Romaine went up the path under the aromatic pines, dashing and handsome, whistling an air from "Travatore," and carelessly clipping at the dead flower-stalks with his silver-mounted riding-whip. It had been a blue, hazy Indian summer's day; the clouds hung dreamily over the sea,—the air was heavy with a slumbering sweetness.

6353 6353

A figure stood in the low window as he came along the veranda. He heard the soft coo of a dove. It was fluttering on the sill,—a snow-white fan-tail, looking with round eyes at the little jewelled hand which the figure held out to it. She called to it softly.

Edith Earnscliffe, in a dinner-dress of sweeping silk,—the hue of May lilacs. There were falls of misty lace here and there about it, and a white shining line of pearls round the lovely arm and throat, and in the wan, golden hair. The proud young face, with its pansy-colored eyes and damask cheeks was very fair to see. The dove balanced itself daintily on her finger-tip, picked at the pearls on her wrist, and fluttered away at the tread of Romaine.

He doffed his cap.

"Am I *de trop*?"

She laughed, and gave him her hand.

"No." Her eyes said a great deal more. Romaine looked down the gilded length of the crimson drawing-rooms.

"First in the field," he said.

"No; papa has taken Miss Eckhart and his other guests into the picture-gallery. Shall we join them?"

His knowing dark eyes laughed at her.

"Oh, I am quite content to remain here,"

"But——" blushing.

He threw himself down near her, half-gallantly, half lazily.

"I have ridden from the harbor to say good-bye to you. Don't quarrel with me."

"Good-bye?"

Edith plucked so nervously at the pearls on her wrist that he expected to see them go rolling away over the floor.

"I return to town to-morrow."

"Indeed!"

"Are you sorry?" mischievously.

She colored again.

"Yes. It will be so dull here, and we are to remain a month longer."

Her sandal-wood fan was lying on the window-sill. He took it up.

"Does Miss Eckhart accompany you to town?"

"Yes."

"For the winter, I suppose?"

She looked at him suspiciously, but the careless, handsome face reassured her. He toyed idly with the fan.

"Papa has decided so."

Romaine laid down the fan satisfied. Wise Romaine! There was another secret looking out from Edith Earnscliffe's eyes which he might have learned more easily still. She loved him.

Dinner came. The Earnscliffe dining-room was long, and wide, and sumptuous, with its rich tables and glittering sideboards. Squire Earnscliffe sat in state amongst his guests. Miss Eckhart was at his right hand.

6355 6355

She was in complete black, pale and statuesque. Her rich hair was brushed away from the blue-veined temples; the eyes beneath looked larger and blacker than ever, and the lids had a white droop. They flashed up involuntarily at Romaine's earnest gaze. Both bowed.

"A marble Juno," he said to Edith.

Down on the shore, in the little wind-swept graveyard of the hamlet, there was a new mound. Old Hans lay there. Hagar had been at Earnscliffe a month. It was the squire's work. He treated her as daintily as if she had been born a princess. A thousand little favors laid at her feet daily; a studied regard for her ease at all times; a quiet, unobtrusive watch of her slightest movements, and his cold, proud manner that always grew so humble before her,—Hagar could but notice these things.

She had quick instincts. They held her aloof from every member of the household; they froze the thanks on her lips. She grew cold, grave, and reticent.

Romaine and some of the younger gentlemen left the table with the ladies. Presently Edith came sweeping past him towards the music-room on the arm of a bearded artist. The arrowy, side-long glance shot from under her long lashes at his cool handsome face, was quite unheeded. He was watching Hagar Eckhart.

"A penny for your thoughts, Monsieur," said Edith.

"They are too precious for barter," he answered, smiling.

She went on.

Hagar was standing at the marble table, with a cluster of flowers and a slender Etruscan vase before her.

He went to her side.

"What have I done, Miss Eckhart?"

She turned.

"Done?"

"Yes; you have ceased speaking to me altogether."

The flowers were put quietly into the vase.

"Pardon me." His dark eyes watched her, half-tender, half-laughing.

"If you will talk with me now."

"Well?" in a little annoyed tone.

"Tell me how you like Earnscliffe."

She was looking over his shoulder at the autumn moon in the purple southwest.

"I like it."

She stood so dim, and fair, and still in the uncertain light, with her long black dress sweeping around her, that Romaine half held his breath.

"Do you know the place is haunted," he asked.

"Yes," smiling; "hear it!"

It was the low sigh of pines, and the sea on the rocks.

"No," said Romaine, "that is not it,—haunted by a legend."

She lifted her eyes, as wondering as a child's.

"Have you never heard it?"

"No."

"The old servants or the hamlet fishermen would tell it to you with a better grace than mine; it is as familiar to them as the sea itself."

There was something in Romaine's face that

held Hagar's eyes like a spell. He looked down the long vacant drawing-room, back again to her.

"You remind me of it standing here; —it—are you brave? It is somewhat ghostly."

"I think I can bear it."

The room was dark and echoing; the carved chairs and cabinets sat up against the wall, like so many specters eager to listen, and Romaine began, half-lightly, half gravely:

"Once upon a time, as the fairy stories say, there was a certain Earnscliffe, master in this old place, young and handsome, and very much inclined, as all the Earnscliffes have hitherto been, to a fast life and dissipated companions. The hamlet people saw but little of him. It was at this time that the young prodigal came home, a matter of pure necessity it seems to have been, and he sat himself down, if not in repentance, at least in peace, to pass the year on his neglected estate"

Romaine looked at Hagar's upturned, listening face, and his own grew grave.

"By and by news came that Earnscliffe was betrothed to a high-born heiress; he was to build up his fallen fortunes with her wealth. The old house would keep its old name after all. The hamlet people heard, and shook their heads vaguely. Earnscliffe had taken to sunset walks of late under the pines, to wild gallops along the shore, to rows in the white moonlight, and he was never alone. It was a lady, they said—something like this lady beside me—that is, she had a Southern face, with midnight eyes and raven hair. Sometimes they would hear her voice in these old rooms, sweet as the white symbols of the sea-foam when they clash on the pebbles. They would see her standing in these windows in the rare silks and old jewels of the house, watching the rise of moons and the set of suns, or, more likely, the coming of Earnscliffe through purple summer twilights. They tell me, if one should come here and listen of still midnights he might hear the dead echoes of her old love-songs stirring the dusk, or the rustle of her dress over the silent floors, or the sound of her sighs in the dim recesses."

Hagar's hand touched his arm in a startled, terrified way. A quivering streak of moonlight had cloven the shadows of the damask curtain and fallen ghastfully across the floor. She heard something behind it, in the darkness, that sounded like a footstep.

Romaine took the little hand upon his arm and held it firmly in his own.

"Well, as I was saying——"

Something rattled beside Romaine, like a hard breath quickly drawn. He turned, and Squire Earnscliffe stood there, his eyes shining through the shadows like live coals.

"Let me close the window," he said, sharply. "Miss Eckhart is shivering. Curse this barren place!"

Hagar recoiled to Romaine's side with a tear on her black lashes.

"I have another tale to tell you," he whispered.

"Of Earnscliffe?" shivering.

"No; of myself."

The squire turned on them sharply.

"Come into the music-room. This is the dreariest place in the house. Ugh!"

He flung the door wide open. A flood of light streamed through. Hagar felt herself drawn back; her hand was carried to a moustachioed lip, and the passionate voice of Romaine breathed in her ear:

"I love you! I want you to know it for your own sake and mine, Hagar."

The hand was dropped softly. Hagar stood in the music-room with the gay crowd and the lights around her, and Edith at the piano—stood there with her life, and the night and its darkness burst suddenly into bloom!

It was yet early when Thomas came to the door with Romaine's horse. Hagar was standing in a dim recess with a fall of drapery around her. He went to her side.

"You gave me no answer to my last story, Hagar."

She crimsoned from brow to throat. He bent over her, his daring lips touched hers, kissed hers passionately, and she kissed back.

"Good-night. I shall come again for your sake, Hagar."

A month after she knew what he meant, but not then; but Squire Earnscliffe, standing just outside the recess, turned suddenly, and his look encountered Romaine's. Neither ever forgot the moment. To Romaine it was a revelation—a seal of certainty on what he half guessed; to Earnscliffe, a mortal despair. The cruel eyes of Romaine seemed searching him through. His thin, aristocratic face whitened; he caught at the drapery behind him, like a man who feels the quicksand under his feet; then Romaine bowed himself out.

CHAPTER IV.

QUIET and solitude at Earnscliffe for the next week. The sky was growing gray and cold,—it was drawing towards winter, and visitors there were like summer birds. Hagar came up from the barren shore one afternoon. The marshes were bleak and dreary; the mournful clouds hung dark and low over the sea. She went on, treading over the fallen pine needles, to Earnscliffe gate. A man stood there waiting, with his hands thrust into the pockets of his pea-jacket, and a great water-dog at his feet. She stopped; it was Stephen Eckhart.

The tears leaped up thick to Hagar's eyes. She went up to him. The broad, brown face lighted; he looked at her from head to foot in a sort of pleased amaze, then drew back, while the dog yawned and licked her hand.

"Stephen!"

"Miss—that is, Hagar, you see I've shipped aboard a whaler for a three-year voyage, and I wanted to come and bid ye good-by."

She clung to his arm.

"Oh! Stephen!"

"Yes, home a'n't home now. You won't take it hard of me if I say I'd like to be remembered kindly by you, Hagar?"

"What do you mean?"

She pressed close up to him, and looked into his honest eyes. Stephen's composure came near breaking down at the sight of that pale, beautiful face.

"You and I was brought up together, anyhow, Hagar, and I love you better now than I ever did afore."

"My dear brother!" she said tearfully.

He held her off at arm's length, with a strange, timid look in his face.

"Let folks talk that want to; but if I make a good voyage, Hagar, and if you think you could like me well enough by-and-by, I'd like to be more to you than a brother."

She stood thunderstruck—uncomprehending. Was the man mad?

He read the thought in her face.

"Don't you know, Hagar?" he cried out fearfully.

"Know?"

"Don't you know what folks are talking about down there in the village?"

"No, Stephen," in a whisper.

He started back from her as if shot.

"I thought you knew, Hagar. I—I—that is I'm sorry; I didn't mean to say anything."

She leaned back against the gate, feeling faint and sick.

"What is it, Stephen?"

The poor fellow was utterly frightened and discomfited.

"Don't ask me. I'm going down to the harbor now. Good-bye."

He went away down the path reluctantly, looking back at her over his shoulder. Hagar stood numb and stupefied till it was too late to recall him, and then she sank down by the gate and dropped her cheek on its hewn stone.

Twilight gathered. The pines moaned hoarsely overhead. It was growing dark; Hagar shivered with the cold and damp,—she had sat there an hour, certainly. She rose up. A groom stood holding a saddled horse inside the gate—a fiery bay—Romaine's. He had come, then, as he promised,

She opened the hall door. Edith's waiting-maid met her on the stair.

"Squire Earnscliffe was waiting to see Miss. Eckhart at the earliest possible moment."

Hagar brushed out her damp, disorded hair, smoothed the sweeping folds of her dress, and went down, wondering vaguely.

They sat in the low, green parlor, which she had first entered on the night of her father's death,—Squire Earnscliffe, Edith, and Romaine. Edith's haughty face was deathly pale. Her hands lay in her lap, locked fast, but still tremulous; her eyes were bent down towards them. Squire Earnscliffe placed a chair for Hagar. Mocking and weird the red firelight danced on the hearth, and the shadows in the corners huddled together, dark and frightened,—she had never seen the room so lonely before.

Romaine arose and stood beside Hagar's chair. The squire's face was working convulsively.

"Hagar," he began, "John Romaine wants you for his wife, and I have given you to him."

Brief and to the point. Hagar's eyebrows arched.

"That is not all," said Romaine, looking calmly at the squire. Edith's lily face went down into her hands. It was the bitterest moment of the squire's life, and of hers.

"No, not all," he answered, catching at the mantel for support. "Hagar, what I *must* tell you now has been noised about in every nook of the hamlet; you might have learned it weeks ago."

Romaine silently took Hagar's cold hand, and held it firmly.

"You remember," said the squire, facing them both with a pale, sorrowful face, "the story that you heard one night of a certain wild master of Earnscliffe, child? It was down in the fishing-hamlet below, that a young Gorman sailor named Hans Eckhart had just found a home for himself and young orphan sister when Earnscliffe first came home. She had a face like yours, and a passionate, willful heart. Earnscliffe saw her and loved. She came to live in this old place for one long, happy year. It was a secret marriage, known to no one but the brother. Earnscliffe forgot his fast companions—the betrothed bride, waiting for him far away—his debts—all—everything, but his beautiful Hagar; but his fast companions sought him out, after a time, and his debts began to press hard and heavy upon him, had to accumulate. Tired of his new life and of the dark-eyed hamlet-girl, he went away! My child, he went away, and left her to wear her sweet young life out in this lonely place; and one dreadful night she opened Hans Eckhart's door and stood in his cottage, with the cruel rain dripping from her hair, and cursed Earnscliffe, and sank down there like one dead. That night a babe was born in Hans Eckhart's home—that night a spirit went out from it,—Hagar died."

He stopped, with great drops of perspiration standing out on his forehead, and clung to the marble again.

"Earnscliffe returned to his estate, bringing his wealthy, high-born bride with him. The child in Hans Eckhart's cottage he did not dare to call his own. Hans was bribed to adopt it—to keep the secret of its birth sacred till his death, and he did."

Hagar cried out sharply. He lifted her to his breast, his hot tears rained down on her cheek.

"My child—my child!"

The room reeled before her; she clung to Romaine's hand; even then she knew and felt it was he who had righted her wrongs.

Edith came and kissed her with cold, white lips, then went away, and Squire Earnscliffe knelt at her feet, and moaned from the depths of a dark remorse: "Forgive for *her* sake!"

* * * * * *

Stephen Eckhart sailed away on his voyage to the wild South seas. The night he left the little fishing-hamlet Earnscliffe House was filled with light and revelry from garret to foundation—it was Hagar Earnscliffe's bridal eve,

Long after that same revelry had died away the pallid face of Edith Earnscliffe remained pressed to the window-pane in her still, dark chamber, gazing blankly out into the night. She had found a sister she never knew,—she had lost the first and last great passion of her life. Years after she married—well, the world said—a stately, purse-proud banker. Romaine and Hagar were far away under the skies of Italy. Edith and they rarely meet, but the blue-eyed boy who stands at Edith's knee to-day, and lifts to hers eyes as blue and bright as those she used to worship, is named Romaine.

RECENT LITERATURE.

Friendship. By OUIDA. Phila.: J. B. Lippincott & Co.

There is so much space given in this Book to describing the social exploits and the idiosyncracies of the Lady Joan that it is impossible to consider it apart from the light of that character. It is as if the author, to combat the difficulty of making her readers realize such an enormity, felt it necessary to dilate upon it.

Whether driving a friend's ponies through the fashionable promenades or driving a bargain for articles of bric-a-brac, or smoking a cigar at Fiordilisa (of which place, together with the body and soul of the owner, Prince Ioris, she takes absolute possession) the Lady Joan is always mean, dishonest, unscrupulous, bold and intriguing. The prince, her victim, is good-hearted, weak and indolent. Her husband, whom she cordially detests, is a passive figure-head.

The heroine, an artist of genius and renown, is the sole character to be admired; and even she, within limits; for, sacrificing her ambition and her fame she finally succumbs to the influence of a blind and unreasoning passion. The scene is laid in Italy, and the story, such as it is, is of the desperate schemes of the Lady Joan, to maintain a position in "Society" and to retain the mastery of the person and property of the prince, and on the other hand of the absorbing love of the heroine for him, and her futile efforts to effect his liberation from the baneful influence of Lady Joan. Of the minor characters introduced is that of Mrs. Henry V. Clams, a type of American women English satirists delight to present as representative, but of which, as in the present case, they generally succeed in making a vulgar burlesque.

Ouida is accredited with having said she wrote books for the army, not for society. It may be well to bear this in mind for a lenient criticism, and yet it is the reverse of complimentary to the soldiers to fancy her standard of morals can find among them any practical adherents or any admirers of the phase of society she so vividly portrays. Most of the stories by this author are marked by an intensely dramatic vein, a sharp individualization, and a certain raciness of style which fascinate while the characters and sentiment revolt. "Friendship" differs from these only in degree, and is therefore less pernicious in its influence than many of the others.

His Inheritance. By ADELINE TRAFTON. Boston: Lee & Shepard. $1.50.

THIS book is interesting from the very satisfactory and entertaining portrayal of miniature society life at Fort Atchison, a military station on the plains, as well as of its garrison life. The characters are well drawn, the plot ingeniously developed, and the incidents naturally and vividly described. But it is the characters comprised in the *dramatis personæ* we cannot like and cannot sympathize with, however faithfully they may be delineated and however entertaining the story may be. The heroine has a pretty face and a capacity to be loved, which, though a negative, is her sole attribute. One regrets that Capt. Ellyot does not marry Miss Laud, by far the most lovable character in the book, but he does not—he marries the heroine, the Sutler's daughter, and the interest of the story centers on his heroic sufferings in his efforts to return to her after an escapade with the Indians in which he is supposed to have been killed, and her quiescent grief, submission to her mother, and unresisted decline and death. The hero, perfect in other respects, betrays a small mental calibre in loving so inane an object. He must be mentally and morally deficient and one cannot respect him, while in the heroine there are none of the attributes of a woman to entitle her to respect. One cannot comprehend the freak of nature which inspires so active and mighty a love in the breast of a strong man for an object so passive and insignificant. It is unnatural and incongruous. Hercules would be imbecile to entertain for a fairy a high order of affection.

A Quiet Life and The Tide on the Moaning Bar. By Mrs. F. H. BURNETT. Philadelphia: T. B. Peterson & Bro. Price 50c.

THESE are two pathetic and simple tales as different from "Theo" and her longer stories as if they were by another author. There is little scope in either story for an elaborate plot, and yet both will be found complete and satisfactory. The first is a touching little story of an artless maiden—the Rector's daughter to whom her love proves her life, and who in losing one loses both. The theme of the second is the same—the character and incidents only widely differing—the too readily given love—the betrayal and despair and death following.

German Without Grammar or Dictionary. By Dr. ZUR BRUCKE. Chicago: S. C. Griggs & Co. Price 50 cents.

THIS little manual ought to be very generally used, as it puts German into a comprehensible shape for those who wish to acquire the language for practical purposes. It has been Dr. Zur Brucke's aim to model his book on the Pestatozzian or object method, and to make his lessons so simple that the most immature intellect can comprehend what is being taught, and in a short time acquire a knowledge of the tongue, that will give him the same freedom of speech that he enjoys in the vernacular. The method is in successful use by the doctor in the Chicago public schools and by others; so that its merit is proved by its success. We recommend it to schools and teachers generally; also to those who wish to acquire German mainly by their own efforts, as it will only be necessary to acquire the pronunciation and then "go at it alone."

MAGAZINES.

THE POPULAR SCIENCE MONTHLY FOR OCTOBER. The number opens with a finely illustrated paper by Prof. J. S. Newberry, of Columbia College, on the "Geological History of New York Island and Harbor." This is a fascinating story of the great natural changes that have taken place since ancient geological times in the land and water areas about New York, and the probable character of those changes that may be expected in the future.

The second article is the fifth of Prof. Alexander Bain's series on "Education as a Science," and deals with the subject of "The Emotions in Education."

Prof. Huxley's address on "The Progress of Anthropology," delivered at the last meeting of the British Association, comes next. Then follows Dr. Montgomery's third and concluding paper on "Monera, and the Problem of Life," in which the "Physical Phase of the Problem" is further considered.

"Electricity and Thunder-Storms," by Elisha Foote, is a short but instructive article, in which the author aims to show that the production of atmospheric electricity is due to the process of condensation. The next paper, by Mr. Herbert Spencer, on "Consciousness under Chloroform," contains a curious and graphic account, by a correspondent, of his mental experiences while inhaling chloroform for the purpose of having a tooth extracted.

"Hallucinations of the Senses," by Dr. Henry Maudsley, is a readable, and, at the same time, very useful paper, showing our constant liability to be deceived by the operations of our senses, and how these operations are disturbed and their results vitiated by surrounding influences. The next article is on "Yellow Fever," by Dr. R. S. Tracy, and, though short, is one of the clearest and most intelligible accounts of the characteristics of that terrible disease that we have anywhere seen. "Bird or Reptile—which?" by Henry O. Forbes; "The Planet Vulcan," by Prof. Daniel Kirkwood: and "The Genesis of Disinterested Benevolence," by Paul Friedmann, make up, with a portrait and sketch of the late Prof. Claude Bernard, the body of the magazine—one hundred and four pages of valuable and entertaining reading.

ART INDUSTRY is a new trade-journal that replaces and absorbs the Jeweler, Silversmith and Watchmaker. Aside from its main object, which is to foster the art-industrial trades, it is a medium for bringing the general public into closer sympathy with a class of workers who possess high intelligence, and whose contributions to the journal will always be interesting reading to those who seek to extend their culture by an acquaintance with all art.

The initial number of this Monthly is a fine specimen of what is being done for trade-journalism, or rather what the publisher, Mr. Howard Lockwood, proposes shall be done in this field. It is finely illustrated, printed on toned-paper, and is altogether so handsome in appearance that we have no doubt of its meeting with the warmest welcome among those to whose interests it appeals. Its aims are epitomized in its appearance. It is published at 74 Duane St.

THE FARM AND FIRESIDE, Springfield, Ohio, published by P. P. Mast & Co., and edited by Mr. T. J. Kirkpatrick, a rising journalist, has in its October issue materially changed and improved its make-up by the substitution of a new title design, which clearly indicates the scope of the journal. Its contents and circulation constantly improve.

SCIENTIFIC AND USEFUL.

A POWERFUL disinfectant, especially adapted to the destruction of insects, is prepared by passing sulphuric acid into alcohol.

WHEN swallows fly low, wet weather may be expected, because the insects which the swallows pursue in their flight, are flying low to escape the moisture of the upper regions of the atmosphere.

MOST aniline stains can readily be removed with alcohol. If the ink is made from cochineal, a weak solution of chloride of lime with a few drops of muriatic acid is sufficient to destroy the color, but it cannot be used on silks and woolens.

COLLECTORS of insects, and amateurs, were, at a recent meeting of the Entomological Society, advised to be on their guard against tricky dealers, who manufacture new varieties by dipping various insects into aniline and other colors.

SPONGE paper, made by adding finely divided sponge to paper pulp, has been used in France for dressing wounds. It absorbs water readily and retains moisture for a long time; it is therefore applicable to many purposes in the arts and manufactures.

FOREIGN journals report that experiments have been made at Langenschwalbach, in Prussia, with a view to utilize the fiber of the common nettle. It was found that when treated in the same way as hemp, the fiber came out as soft as silk and as strong as linen; and this result being regarded as encouraging, a large plantation of nettles has been made to provide material for experiments on a larger scale.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

MOP HANDLE PAPERS, NO. 6.

MAY MAPLE.

DO RAG CARPETS PAY!

"Does it pay to make rag carpets, when one must pay from fifteen to twenty cents a yard for weaving; and when one can buy store carpet at fifty cents per yard?" inquired Mrs. W., as she finished winding a large ball of carpet rags.

"Indeed I think it is economy to make rag carpets; for they last so much longer than others. A good one will last for years," was my reply.

"Not when one has a houseful of men and boys to tear around as *we* have;" said Mrs. W.

"Of course not," said Mrs. Edson, our hostess. "It is very different at May's; you know there is only a small family there, and carpets and furniture last much longer with her folks than they would with you or me. For my part, I don't think a rag carpet would pay us for the time spent in getting the rags together. If one has a spare room that is only to be used once in a great while, it may pay very well. But with our small cottages, there is no economy about it, in my estimation."

This bit of conversation was between ladies who were living in a newly settled country. A few of the neighbors in the vicinity had been "putting on airs," by having their floors carpeted, and others were making preparations to follow in their wake; though, as in the case of Mrs. W, with some doubts and misgivings as to the economy of "the move."

I did not feel called upon then and there, to reply to Mrs. Edson's part of the argument. But I kept up a "desperate thinking;" for I was sure that a good substantial rag carpet did pay, and in many ways. In nine cases out of ten one who lacks energy to make a rag carpet, will not have the means to buy a store carpet, even at fifty cents per yard, when it must be cash in hand, and then, if purchased, it is a poor thing and will not, with the best of care, endure the wear of every day use for one season. But even that would pay by giving the house a more habitable appearance; for a house with bare floors, though it be ever so well furnished otherwise, looks naked and barn-like. But a rag-carpet pays better in an ordinary farm house, because it wears better and is better adapted to the circumstances of the family, and corresponds with the usually plain furniture.

It pays by subduing the noise caused by the tramp of boots, the moving of chairs, the rattling of dishes, and in softening the tones of voices. Indeed, a rag carpet has a softening and refining influence upon every member of the family. Even those rough boys forbear to scuffle in the house, because it will injure the carpet that mother worked so hard to make, and they hate to see the pleasant room grow shabby. Boys as well as girls, like to have their home look cheery and "stylish," and thus the rag carpet wears much longer than the matron imagined it would.

Mrs. Friendly had long contemplated making a carpet, and had her rags all prepared. But her husband, though a model man in most habits, had contracted in the days of "keeping back," the fearful habit of spitting upon the floor. And during his married life the habit had remained unchecked, perhaps, because his girl wife was all too timid to let him know that she could see his faults. And on account of this distressing habit, she had delayed having her carpet woven.

The third summer after their marriage they paid a visit to a wealthy brother of Mr. Friendly. Here every room in the house, except the little box of a "store room," was elegantly furnished, and Mrs. Friendly dreaded to have her husband come into those elegant rooms for fear the beautiful velvet carpets might be desecrated by his presence. She was agreeably surprised to see that he invariably used the spittoon. In less than a month after her return, Mrs. Friendly had her rag carpets upon her floors, and a neat little box of sawdust placed in the neighborhood of the arm chair, was all the hint her husband needed; his bad habit was at once cured.

Indeed if one had to make a carpet every spring, I believe it *would pay*; just for its refining influence, for it certainly paves the way for taking care of more elegant furnishings. And then it *does* save such an amount of hard labor, bringing water from some far-off spring, or drawing it from some deep, deep well or inconvenient cistern, to wash and scrub the floors six times a week.

A QUESTION OF FACTS.

I HAVE been looking over Miss Corson's Cooking Manual, of which I have bought several copies, and find in it many valuable hints and details as to cooking to the best advantage the simple food that is in every house, without waste and with a relish that is not always to be found even in elaborate cookery books. And it has occurred to me to ask why it is that physicians do not take up the subject of health in diet more, and enlighten the world as to the truth of many things that are in doubt at present. Are tomatoes healthful? Of course, you will say, "No one doubts it." Yet I know people who affirm that they are sure to encourage cancer if eaten in large quantities. And while I do not believe in their injurious effects, I am led to consider these things by a statement from the London Globe concerning a boy who died from eating peach kernels. Yet how many times, in making these preserves, have I broken the stones and put in the meats in order to give a flavor to the canned or preserved peaches!—We should surely have the *facts* proved and attested, if it is true that one ounce of peach kernels contains a grain of pure hydrocyanic acid, and less than a grain of this poison will kill an adult, two-thirds being sure death to a child. ANNIE L. JACK.

DOMESTIC RECIPES.

Boston Brown Bread.

ONE heaping coffee-cupful each of Indian, rye and Graham meal; sift and beat together with two cupfuls of molasses, two cupfuls of sweet milk and one of sour, adding a tablespoonful of cream; one dessert-spoonful of soda and a little salt. Beat thoroughly and pour into a tin form; steam four hours and then place in the oven to brown.

Pickled Pears.

SEVEN pounds of fruit; three and a half pounds of sugar; one pint of vinegar; cloves, cinnamon and allspice tied in a cloth. Put the sugar, vinegar and spice into a porcelain kettle, boil up and skim; then add the fruit; which should be peeled and left whole, and boil until fully done. Put into cans, pour over the syrup and screw down air-tight.

Graham Paste.

MIX lightly one pound of Graham flour with a pint of thick, sweet cream; add salt, roll thin and bake as other pastry.

Horse-radish.

IF horse-radish be prepared in the fall as follows, it may be kept all winter:

To each coffee-cupful of horse-radish allow one teaspoonful of salt; one tablespoonful of white sugar and a pint and a half of good vinegar; bottle and seal. E. M.

Tomato Catsup.

WASH green tomatoes and slice them rather thin; weigh them; allow three or four sliced onions, or not as preferred, four pounds of sugar and a gallon of cider-vinegar to eight pounds of tomatoes. Put the vinegar to boil in a porcelain kettle with the sugar, stir it, and when it boils up, set it off, and let it stand a few minutes until the scum can be removed without wasting the vinegar; then add the onions, two teaspoonfuls of salt, a tablespoonful each of powdered cinnamon and cloves, and a grated nutmeg; then set it upon the fire, and immediately add the tomatoes. When the vinegar begins to simmer, press the tomatoes gently down. Let them boil only two or three minutes. Put them into covered jars; or when cool enough, into wide-monthed bottles. When the pickles are all used, the vinegar need not be lost, as it is excellent upon baked beans, and cold salt meat or in mince pies, etc.

"YOUNG HOUSEKEEPER'S FRIEND.

News of the Week.

Monday, Oct. 13, 1878.

POLITICAL.

The results of the October elections held last Tuesday in Ohio, Indiana, Iowa and West Virginia seem to be highly satisfactory both to the republicans and democrats, judging by the loud huzzas and congratulations of their newspaper organs. Since the news came from Maine of the unexpected strength shown by the greenback party, both of the old parties were much alarmed by the "unknown quantity" represented by the new candidate for popular suffrage; and now both or them are not a little relieved by discovering that it is much smaller than their fears had pictured it. It entered so strong into the present campaign, winning three seats in Congress from the Pine-tree State, that it was naturally supposed it would be a formidable opponent in the Western States in which the greenback doctrine originated and where it has always had its ablest and most numerous supporters. The surprise to the old parties was as great therefore as the disappointment must have been to the new, to find that in the four States that cast their votes for congressmen on Tuesday, only two greenbackers were elected, and these only by democratic support. While republicans and democrats share equally the satisfaction arising from the discovery of the weakness of this third party, each has some special grounds for self-congratulation. The tide of unpopularity that was rising against the republicans at the last presidential election, has evidently reached its flood, and begun to ebb. The majority of 20,000 against them at the last election in Ohio has been wiped out, and they have carried the State by a plurality of about 10,000, making a gain of 30,000. In Iowa also they have probably increased the vote on their State ticket, although the greenbackers, by joining with the democrats, have there wrested from them two seats in Congress. In Indiana they have about held their own on the State ticket, and in an "off" year, with the loss of many farmers who usually supported them but who this year voted the greenback ticket, they are disposed to rest content with a drawn game. On the other hand, though the democrats have lost the State ticket in Ohio, they gerrymandered the electoral districts so skillfully in the last legislature, that they have won three congressmen, the republicans electing only nine congressmen this year instead of twelve at last election, and the democrats eleven instead of eight. In Indiana the latter have been still more fortunate; for, in addition to having gained three congressmen, they have secured a majority of the State legislature, thus insuring the reelection of Voorhees, the present Senator. By latest accounts the legislature stands, on joint ballot, 79 democrats; 65 republicans; six nationals. In West Virginia, though the greenbackers cast a heavy vote, the democrats succeeded, as usual, in gaining all three congressmen. The greenbackers only polled about 30,000 votes in Ohio, about the same number in Indiana, and nearly 35,000 in Iowa. It should be borne in mind, however, by the "hard money" men that most of the democrats elected are "soft money" advocates, so that many democrats who believe in the "Ohio Idea," finding they could support it within their own party, did so without joining the straight-out greenbackers.

It tickles the anti-Butler papers of Massachusetts—and nearly all the papers in the State are in that category—to be able to point out features in his business career inconsistent with his present *role* as the workingman's friend. Since 1857 he has been a large stockholder in the Middlesex Woolen Mills at Lowell, which, in 1862, paid 31 per cent. on the capital invested, 45 per cent. in 1863, and an average of 20 per cent. since the first date mentioned to the present time, yet the wages of the workingmen there have always been low in comparison with the amount paid elsewhere. Card-strippers in the Middlesex Mills now secure only 86 cents a day to support their families, while at the mills owned by Gov. Talbot, the republican candidate, at North Bellerica, the lowest wages paid to any man is $1.25. And yet Butler expects a heavy vote at Lowell. Then, these papers get hearty anathemas from Ben. for reiterating the old charges with regard to his enormous fee for securing the Farragut prize-money for the capture of New Orleans. The total sum obtained was $123,472,000; total expenses $142,411, of which Butler and a couple of subordinate lawyers pocketed $123,472; thus heavily mulcting the sailors to whom it was due. The large number of candidates in the field throughout the country is a pretty fair indication of the confusion of parties, the multitude of would-be statesmen the nation is blessed (?) with, and the probability of no small amount of scratching at the coming elections. There are altogether 292 representative districts and over 800 candidates, and as less than half the members of the present House have been renominated, and a good many of these will fail of election, there will be many new faces in the next Congress. Among the prominet absentees from it will be Gen. Banks, who missed a renomination by a single vote, and Mr. Sayler, a prominent rival of Randall for the Speakership, who has just been defeated at Cincinnati. Several republican campaign meetings having been broken up by the democrats in South Carolina, Alabama and Louisiana, Attorney-General Devens has instructed the district attorneys and U. S. marshals in those States to impartially, but firmly enforce the laws for the punishment of all combinations or conspiracies for such attempts, by the arrest and indictment of all guilty parties. This just measure has given rise to the charge, in a number of democratic papers, that Hayes is about to change his conciliatory policy towards the South. But surely conciliation does not mean permission to persecute political opponents and resort to the "shot-gun" policy. The Convention to frame a new Constitution for California, consists of 78 non-partisans, 52 workingmen, 10 straight republicans, 9 straight democrats, 1 farmer and workingman and 1 independent.

The past week has been rather unfortunate for Mr. Tilden's chances of being again the democratic candidate for President. On Tuesday last the Tribune of this city published, with translation, a series of cipher dispatches relating to the Florida count during the last electoral troubles. Of these the most important bear dates between Nov. 30 and Dec. 5, 1876, and passed between Col. Pelton, Tilden's nephew, and B. Havemyer in New York, and Manton Marble and others of Tilden's friends in Florida. They leave no doubt but that negotiations were entered into with one or more of the republican members of the Florida Returning Board, for the sale of their votes to Tilden. The decision of the Board and the Governor's certificate were offered for $200,000. Marble telegraphed this; but the figure was considered too high. An offer of a single member of the Board, however, to sell his vote for $50,000 was accepted, but by some mistake the cipher dispatch authorizing the payment arrived too late. The general opinion seems to be that it will be hard for Tilden to convince people that he knew nothing about this project of bribery. The same day these dispatches were published, Tammany Hall succeeded in organizing the State Democratic Committee in its own interest and against Tilden by a vote of 17 to 14; and on last Friday Harland, Tilden's lawyer in the Government's suit against him for unpaid income tax, was indicted at Marquette, Mich., for being an accomplice in the theft of the books belonging to the New York Mining Co., in which Tilden was interested, an account of which theft was given here the week before last. Here again there were inculpating cipher dispatches from Col. Pelton; and it is boldly said that the books show that Tilden cheated the Government. Yet, after all, public opinion should "give the old man a chance"—to explain. What kind of republican arguments were werful enough to nullify the liberal disposition of the democrats to bribe? Can any one guess?

MISCELLANEOUS.

On Monday last eight drunken, disreputable negroes entered a house of ill-fame at Mt. Vernon, Ind., and robbed and abused three of the female inmates. On Tuesday four of the miscreants were arrested and put in jail; on Friday morning at 2 o'clock the deputy sheriff with a *posse* surrounded the house of an old negro, named Harris, for the purpose of arresting his son, one of the criminals. Harris shot the deputy sheriff dead, but was arrested by his assistants. At night a party of masked vigilantes overpowered the guards of the jail; broke into the building; cut Harris to pieces, threw the fragments into the privy, and then dragged the four other wretches into the neighboring square and strung them up to the branches of the trees, where they were allowed to hang until taken down by the coroner next day.

FOREIGN.

There has been a negro rebellion in the island of Santa Cruz, West Indies. The whites number 3,000, the negroes 22,000, and there are only 50 soldiers on the island. French and English men-of-war, however, landed troops, killed 300 negroes on one plantation, and have suppressed the trouble. A small part only of the negroes rose in insurrection. On Friday last a couple of roughs began to fight in the pit of Liverpool, England, theatre; a cry of "Fire!" was raised, the audience stampeded, 30 men and a number of women and children were crushed to death. The outlook in Europe is anything but bright. In Great Britain the failure of the City of Glasgow Bank has caused a number of other heavy failures, the last of which is that of a large Manchester shipping house with liabilities of from $5,000,000 to $10,000,000. Strikes are in progress in several parts of Scotland and England, while in Ireland the National party are jubilant at England's troubles with Afghanistan. Telegrams last Monday that war had actually commenced were premature, and news to the same effect yesterday is contradicted to-day by hints that a peaceful settlement is yet possible. England is collecting a heavy force so as promptly to crush the enemy; the Ameer is already prepared, well supplied with Russian officers and arms, and in possession of the passes through the mountain range that separates his territories from British India. In Frace there is a prospect of a coalition of all other parties against the republicans, and a stormy time is anticipated. In Germany Bismarck is sternly pressing the passage of the laws against socialists, seeking supporters now from the Liberals, now from the Ultramontanes, while the Socialists declare that if driven to the wall the discontent of a military-ridden and tax-oppressed people will find vent in revolution and warn Bismarck of a repetition of the scenes of bloodshed and revolt in 1848.

In Austrio-Hungary, the Hungarians are bitterly opposed to the occupation of Bosnia and Herzegovina, and refuse to supply money to pay the invading army; although the country is occupied almost entirely, yet the population is intensely hostile; there is danger of Turkey taking a part in the struggle, should the Austrians attempt to occupy Novi-Bazar, a step they insist on taking. Russia is still lingering as close to Constantinople as possible; with England at war in the East, and Austria embroiled with Turkey, the Czar may think himself strong enough to treat the treaty of Berlin in 1878, with the same contempt with which he treated that of Paris, in 1871.

There are a good many jokes about the love of savages for missionaries, but five Methodist ministers who were recently eaten by the bush natives near Mallcota on the coast of New Zealand, found it no joking matter. Urged on by a holy wrath traders and christianized natives killed 80 of the tribe in retaliation. The close of the Paris Exposition is again definitely fixed—this time for Nov. 20. Mr. Krantz, the chief commissioner of the Exposition has arranged for a fete at the Trocadero on the 15th inst. for the benefit of our yellow fever sufferers. The Albanians who slew Mehemet Ali and his escort have added another to their deeds of blood. The commandant of Podgoritza in the territory given to Montenegro by the Berlin treaty, announced the receipt of instructions to surrender the fortress and straightway he and his whole garrison of 156 men were massacred. Montenegro is likely to find troublesome subjects in her fresh acquisition. The inhabitants of the Dobrudscha are so bitterly opposed to the Roumanian rule, to which they ave been handed over, that the Roumanians dare not for the present attempt to take possession of the country. The Porte has begun reforms by removing a number of Pashas who are accused of corruption, arresting others and ordering the execution of a number of Kurds and Begs for atrocities they have committed. HERMAN.

EVERY AMERICAN has freedom, and almost every American has catarrh. It is the national complaint. No surer index to its prevalence can be desired than the myriad remedies proposed for its cure. One meeting with great success is that recommended by the Rev. T. P. Childs, whose announcement appears elsewhere in this issue. This gentleman gives a very accurate description of the causes of the disease and the dire results of inattention in the preliminary stages. He also explains his manner of subduing the disease, which is simple, and it would appear should be effective. Inhalation is very generally conceded to be the most direct way to apply medicine to the lungs and air passages, and with the knowledge of the inhalants that are indicated, which Mr. Childs' success would seem to show that he possesses, the disease should yield to treatment.

THE MARKETS.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, Oct. 12, 1878

BEANS AND PEAS.—The trade regards prices for mediums and marrows as rather strong for free purchases, and the market is tamer than it was at the opening for new stock. New beans lead the dom ind when very choice. Red kidneys are looking up a trifle. White kidney and pea firm and scarce. Black beans quiet, with a wide range. Canadian peas in bulk and bond, 78@80c.; green peas, $1 25@1.35.; Southern B. E. peas, $2.50@2.75 per 2-bush. bag.; Medium beans, new, $1 75; old, $1 62@1.65; marrows, new, $1 75@1 80; old $1.57½@1.60; pea and white kidney, 1 75@$1 80; red kidney, fair to choice, $1 75@2 20; black, $1.40@1.90.

BUTTER.—The market is rather limp, the only grades holding tone are choice creamery and selected half tubs and perfect western. Although receipts are large, fine September does not show its usual quantity. This grade is now generally looked for, especially for the full single-package trade, that has become one of the features of the butter market of late years. In dairies we hear of little animation; line firkin dairies are dull. Low grades of butter here and to arrive will have quite a contest with oleomargarine when cold weather sets in, as the latter is obtaining considerable enterprising push. Exporters are at the moment using low grades and name very low prices.

Dairy, pails, choice, 21@22c.; fair to prime, 15@20c.; poor, 12@13c.; State, half-tubs, choice, 20c.; fair to prime, 16@18c.; poor, 10@12c.; entire dairies, 18@20c.; firkins, 16@18c.; Welsh, tubs, choice, 19@20c.; good to prime, 16@18c.; poor, 10@14c.; creamery, selected, 25@26c.; other, 23@25c.; Ohio and State, sweet, cream, 22@24c.; Western creamery, choice, 25c.; poor to prime, 19@22c.; Western dairy, choice, 15@16c.; other, 12@14c.; Western factory, ladle packed, 10@13c.; milled and common, 7@10c.; State dairies, full, 19c.; firkin dairies, 15@18c.

Receipts for week, 33,857 pkgs. Exports, 4,083 pkgs.

CHEESE.—There has been rather an unsatisfactory look to the market this week, and especially so towards the close, when shippers became very indifferent. Early in the week 10c. was quite frequent, on a certain quality of fancy factories, but this price at the close is rarely talked, and 9¼@9¾c. are the more general rates. The outward movement for this week has been 47,638 boxes

Quotations are 9½@9¾c. for fancy late made; 7¾@8¾c. for good and prime; 6¾@7¾c. for fair to good; 5½@7c. for half-skimmed; 4@5¾c. for skimmed. State, farm dairy at 8@9c¼. for good to choice, 6¾@8c. for fair to good, and 3½@5¾c. for poor skimmed. Wisconsin factory, fine to fancy, 9@9¾c.; do. good to prime, 7¾@8¾c.; do. fair to good, 6¾@7¾c. Western factory, fine and fancy, 8¾@9¾c.; good and prime7@8c.; fair, 6@7c.

Gold closes at 101¼.

Liverpool cable 46s.

COTTON.—The market has suffered a bad break latterly. Aside from the exceptionally heavy port arrivals as an influence, there has been the rather gloomy look of affairs on the other side operating. Latest prices are October, 10.23@10.24c.; November, 10.21c.; December, 10.23c.; January, 10.26@10.27c.; February, 10.31c.; March, 10.43@10.44c.; April, 10.50@10.51c.; May, 10.60@10.61c.; June, 10.67@10.69c.; July, 10.72@10.75.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8 7-16	8 7-16	8 11-16	8 11-16
Strict ordinary	8¾	8¾	9¼	9¼
Good ordinary	9¼	9 9¾	9¼	9¾
Strict good do	9 13-16	9 13-16	10 1-16	10 1-16
Low middling	10 1-16	10 1-16	10 5-16	10 5-16
Strict L. middling	10 3-16	10 3-16	10 7-16	10 7-16
Middling	10 5-16	10 5-16	10 9-16	10 9-16
Good middling	10 9-16	10 9-16	10 13-16	10 13-16
Strict G. middling	10 13-16	10 13-16	11 1-16	11 1-16
Middling fair	11 5-16	11 5-16	11 9-16	11 9-16
Fair	11 15-16	11 15-16	12 3-16	12 3-16

Stained.

Good ordinary, 8 9-16; Strict good ordinary, 9 1-16
Low middling, 9 9-16; Middling, 9 15-16

DRIED FRUITS.—Trade generally is sluggish. The better grades of apples have a jobbing trade which keeps them fairly steady in price; quartered lots are hard to move. Peeled peaches show a moderate degree of activity and firm prices. Small fruits are slow.

New blackberries are quoted at 5½c. Peaches—Peeled, new Georgia, at 6c. for poor; 7¼@8½c. for fair to good; 9@9¾c. for prime; choice North Carolina, 10@11c.; good do., 8@9c.; unpeeled new halves, 3½c.; quarters, 3¼c. Pitted cherries, 15@15¾.; southern plums, 11@12c. Apples—Old State quarters, 2½@2¾c.; do., sliced, prime, 4c.; do., good, 3@3¼c. New apples 2¾@3¼c. for Southern quarters in bbls.; 4½@5¼c. for prime sliced, and 6@7c. for fancy. New raspberries, 25@26c., and evaporated, 27@28c.

Exports past week, 823 bbls. dried apples.

EGGS.—Receipts for the week 8,562 bbls. Supplies are larger, but the demand has kept steady enough to hold prices where they were. Near points, 23@24c.; State and Penn., 23@23c.; Western, fresh 21@22c, Canadian 21½@22c.; poor lots, 20@21c.; limed State, 17@18c.; Western, 16@17c., prime; poor, 14@16c.

FRESH FRUITS.—The market for apples has ruled weak, and the bulk of the liberal supply is again down to very easy figures. Choicest fall varieties do not exceed $1.75; the general range for fall is $1.25@1.62; good to best, winter, $1@1.25; common stock, 50@75c. bbl. Cranberries have a fair demand; fancy bbls., $8; prime Capes, $7@7.50; other bbls., $5@6.50 including N. J. crates, $1.50@2.12. Quinces in good demand, at $3@6.50, the latter in choice apple. Fine pears are in few hands: extra Seckel, $12@14 bbl.; common, $7@9; choice Virgalieu, $9; other table pears, $5@7; cooking, $2.50@3.50. Grapes are tending higher, the improvement showing in choice packed, small boxes. Delaware, State, cases 18-3 lb. boxes, $4@5; loose, 8@10c. lb.; Concord, State, 18-3lb. boxes, $3@3.50; poor to prime, loose, 3@6c, lb.; Catawba, 7@8c.; Isabella, 4@6c. The remnant of peanuts is so small that quotations can only be revised until new crops arrive; last rates of hand-picked Va., $1.60@1.65; $1.55 quoted for new and old mixed. Chestnuts have dropped to $3@3.50 bush. Hickory nuts, $2@2.50. Hot-house grapes, 25@40c. lb.

Exports of apples, past week, 12,382 bbls.

FLOUR.—Supplies have been large, of the winter wheat grades especially, and there has been a pressure in selling which has led to a further decline.

Latest prices are: $3.50@3.80 for poor to choice superfine State; $3.85@4.15 for poor to good extra do., odd lots and lines; $4.15@4.40 for good to choice do., strictly choice and fancy lots above this; $3.50@3.90 for very poor to fancy superfine Indiana, Iowa, Michigan, &c.; $3.85@4.15 for inferior to good shipping extra do. and $4.15@4.40 for good to choice extra do.; common to about choice white wheat extras, $4.10@5.00; choice to about fancy do. at $5.10@5.85; red and amber winter wheat, inferior to very choice trade and family at $3.90@5.20; round hoop Ohio at $3.90@4.25, and trade and family brands of do. at $4.25@5.50, the latter rate for very choice. St. Louis, $4.00@4.65 for very poor to good extra, and $4.65@6.00 for good to very fancy; Minnesota clear, very inferior to fancy at $3.85@5.75; Minnesota "straight," inferior to very choice at $5.60@6.25; and patent fair to very fancy at $6.25@8.50; unsound stock at from, $3@5.00; city mill extra at $5 00@5.15 for West Indies (the latter rate for strictly choice in new packages); do. for England, $3.85@4.00; do. trade and family extras, $5.50@6.50; do. for South America, $5.25@5.75 for fair to fancy; No. 2 at $2.70@3.25 for very inferior to very choice.

BUCKWHEAT FLOUR is offered lower, down to $1.00@1.35 for fair and choice new.

GRAIN.—The advices from abroad—nervousness as respects the financial situation there, and the generally tame position of affairs, have operated against trade here, and prices have been feverish.

Latest sales of wheat are, of No. 1 white at $1 08@1 08¾; No. 2 white, at $1 06@1 06¾; ungraded white, at 98c.@$1 09; No. 1 red at $1 05¾@1 06¼; No. 2 red at $1 04@1 04¾; white State at $1 08½@1 09; extra white at $1 08¾@1 09; No. 2 red, steamer grade, at $1 02@1 02½; No. 3 red, at 98c.@$1; No. 3 spring at 82½@84½c.; rejected and ungraded spring at 70@85c.; ungraded red at 95c.@$1 05; No. 2 amber at $1 02¾@1 03; do., steamer grade, at 99@99½c.; ungraded amber at $1 01@1 05; white Canada, in bond, at $1 05; red Canada, in bond, at $1 03; No. 2 spring at 92¾@93c.; No. 1 white, October, at $1 08@1 08¾; No. 2 red, October option, at $1 04¾@1 04¾; do., November option, at $1 05¼@1 05¾; do., December option, at $1 06¾; No. 2 amber, October option, at $1 02¾@1 03; do. November option, at $1 04; New York No. 2 spring, October option, at 92¾@93c.; do., November option, at 94¼@95c. Rye at 60@65c. for prime State, in car and boat loads. Of corn, latest sales are, of steamer mixed at 47¾@47½c.; New York No. 2, at 47¾@48c.; ungraded mixed western, at 45¾@48¾c.; Jersey yellow at 50c.; New York No. 2 2 white at 51c., and round yellow at 63c.; New York No. 2, October option, at 47¾@48c.; do., November option, at 49½c.; do., December option, at 50@50¾c.; steamer mixed, October option, at 47½c.; do., November option, at 48c.; do., December option, at 47¾c. Oats at, for New York No. 1 at 31@31¾c.; New York No. 2 at 29c.; New York No. 3 at 27½c.; New York rejected at 26c.; No 2 Chicago at 29c.; extra white quoted at 33¾c.; New York No. 1 white, at 34¾c.; New York No. 2 do., at 33¾@33½c.; New York No. 3 do., at 28¾c.; white western at 27@35½c.; mixed do. at 26¾@32¾c.; white State at 29@33c.; mixed do., 28@33c.

HAY AND STRAW.—There is a good sale for prime hay, which holds steady in price; common and medium grades are abundant and easy.

Latest sales are at 40@45c. for shipping, and 65@70c. for retail qualities. Straw quoted at 20@45c. for long rye; 30@35c. for short rye.

Exports for the week, 1,015 bales; since Jan. 1st., 49,167 do.; same time last year, 35,249 do.

HONEY.—The offering is in early, but sales are confined to buyers who make first seasonable items embellish their stores. Sales for consumption will not open until later on. Clover, single comb, 15@17c.; two comb, 13@14c.; Buckwheat, 10@12c. Strained ranges at 6@12c., dark to choice clear.

HOPS.—Shipments for the week have been 450 bales; this rather better export movement has been prompted by easy prices as well as more attractive assortments. Sales rarely exceed 12 to 13.

Quotations are for New Yorks, new crop, choice, 13@14; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@13; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@8; Olds, all growth, 2@4.

OIL-CAKE is plenty and easy in price: western quoted at $29.

POULTRY AND GAME.—Live fowls are doing better than chickens. Exportation to Havana will resume when prices are easier.

Chickens, N. J., 12@12½c. ₱ lb.; State, 11½@12c.; Southern and Western, 10@11c. Fowls—N. J., 13@13½c.; State, 12½@13c.; Western, 12@12½c. Ducks, fat, ₱ pair, $1@1.25; poor to fair, 40@90c. Geese, N. J. and Penn., $1.25@1.75; Southern and Western, $1@1.25. Turkeys, ₱ lb., 9@13c.

Some steam-picked dressed are arriving, but the plan is risky while the weather is fickle. Turkeys are in better demand.

Turkeys, dry picked, 15@16c.; other, 11@13c. Pa. chickens, 15@18c.; N. J., 13@15c.; State, 13@14c.; Western, 12@13c. Pa. dry picked fowls, 14@15c.; N. J., 13@14c.; poor to fair other, 10@12c. Ducks, extra, 16@18c.; State, 13@14c.; poor, 10@12c. Geese, choice, 14@16c.; other, 8@10c.

Game is in fair supply for the wants of the trade. Grouse doing better.

Grouse, trapped, pair, $1; State partridges, 80@85c.; Western, 40@50c. Woodcock, State, 50@60c.; Western, 40@50c.; English snipe, $1.50@1.75 doz.; plover, $1.50@1.75; wild pigeons, still-fed, $2; flight, $1.40@1.50; wild ducks, Mallard, 60c. ₱ pair; Teal, 50c.; common, 30@35c. Venison saddles, 18@20c.

PROVISIONS have tended a little stronger with more active export calls. Mess pork quoted at $8.35@9.00 for spot lots; $8 70@8 80 for October and November, and $8.80@8.90 for December. Bacon at 5¾c. for long clear and 6¼ for short clear. Lard at $6.60@6 67½ for spot lots; $6 65 for October and November, and $6 67½ for December. Stearine at 7c. for Western. Tallow at 6¾@6 15-16c. for prime. Beef Hams at $16.50@17 western. Beef—extra mess, at $10 50@11; plain mess, $10@10.50; packet, $11@12 for bbls.; extra India $19 50@21 for city brands; do., Philadelphia, $18@19.

SEEDS.—Grass are easy; timothy quoted at $1.15. Clover at 7½@7 11-16c. Flaxseed at $1.45 offered and $1.50 held.

TOBACCO.—Export trade continues steady, and prices well sustained. Quotations are for

LIVE STOCK MARKETS

Saturday, Oct 12 1878.

BEEVES.—Receipts for the week, 10,492 head do. last week, 13,372 do. The local demand for beef is increasing, and prices at the yards this week indicate by their strength unaided by any material export demand. Some Texas, Cherokee and Colorado cattle sold at an advance of about ½c. per lb. Sales of Texans were at an advance ½c. per lb. The range for native steers in lots was 8@10c. per lb. to dress, 55@56 lb., with extra and fancy selections sold up to 10½@10¾c. to dress 57 lb. Texas, Cherokee and Colorado half-breeds were generally sold at 6¼@7¼c. per lb. to dress lb.; but some mixed Missouri and Colorado steers went up to 8¼@8½c. per lb. Light grass-fed bulls (3 car loads) were sold at $2 40@2 50 per 100 lb., live weight.

COWS AND CALVES.—Several car-loads again reported sold at $45@65 per head. A few extra milkers would exceed the extreme.

VEAL CALVES.—The market was dull early in the week, but at the close prime milk stock is firm. N. J. and Bucks Co., 7¼@7½c.; good do., 6½@7c.; extra heavy, 5@6¼c.; State calves, 6@7¼c.; fed calves 3½@4½c.; grassers, 2¾@3c.

SHEEP AND LAMBS.—Receipts for the week, 34,498 head; do. last week, 23,460 do. Market not steady. Common to prime sheep, 4@5¾c. lb. Lambs, $4.90@5 50 per 100.

SWINE.—Receipts for the week, 29,856 head; do. last week, 33,084 do. Late sales, $4 37½@4 43¾ per 100, and $4 41¼ for corn fed; rough stock, $3 31@3 37. N. J. pigs, dressed 5¼@5½c. heavy; 5¾@6c. medium; 6¼@6½c. light.

SPECIAL NOTICES.

For particulars regarding Electric Belts, &c., address PULVERMACHER GALVANIC Co., Cincinnati, O.

CATARRH

The possessors of the terrible disease known as CATARRH (many affections of the head and throat are called by other names, but properly belong to the catarrhal class) have no doubt in their own minds that they are shunned by their friends because of their foul and loathsome breath, but few, however, are aware of the danger they incur by allowing it to go on uncheoked.

WHAT IS CATARRH?

Thousands suffer without knowing the nature of this almost universal complaint It is an ulceration of the head. Its indications are, hawking, spitting, *weak, inflamed eyes*, frequent soreness of the throat, dryness and heat of the nose, *matter* running from the head, down the throat, often ringing or deafness in the ears, loss of smell, memory impaired. *Dullness* and *dizziness* of the head, often in the first stages, but more commonly in its advanced stages, attended with pains in the chest or left side, and under the shoulder blades. Indigestion usually attends Catarrh; a hacking cough and colds are very common; some have all these symptoms; others only a part. Very little pain attends Catarrh, until the liver and the lungs are attacked in consequence of the stream of pollution running from the head into the stomach.

All such persons catch cold easily, and have frequently a running at the nostrils; the breath sometimes reveals to all around the corruption within, while the patient has frequently lost all sense of smell. The disease advances cautiously, until pain in the chest, lungs or bowels, startles him; he hacks and coughs, has dyspepsia, liver complaint, and is urged by his doctor to take this or that; perhaps, even cod liver oil is prescribed. Perfectly ridiculous! The foul ulcers in the head cannot be reached by pouring such stuff into the poor, jaded stomach. The patient becomes nervous, the voice is harsh and unnatural, he feels disheartened, memory loses her power, judgment her zeal, gloomy forebodings hang overhead; hundreds, yes thousands in such circumstances, feel that to die would be a relief, and many even do cut the thread of life to end their sorrows.

THOUSANDS ARE DYING

In early life with consumption, who can look back a few years—perhaps only months—when it was *only catarrh*. Neglected when a cure is possible, very soon it will transform the features of health and youth into the dark, pallid appearance, while the hacking cough, the excess of blood gushing from the lungs, or night sweats, all significantly proclaim it is *too late; and thus a neglected catarrh ends in the consumptive's grave.*

NASAL CATARRH.

Sometimes the disease only affects the membranes lining the nasal passages, and they may be easily reached and cured by simple means But when it is located in the *frontal sinus*, or in the *posterior nares*, or if it has entered the *eustachian tubes*, and is injuring the ears, then nothing but finely medicated vapor can effectually reach it and destroy it. And certainly after it has affected the throat and bronchial tubes, as all well-read physicians will readily attest, nothing can be relied on to effect a permanent cure but the inhalation of properly medicated vapor. In the same manner that we breathe common air, we can inhale and breathe a medicated air; and it is perfectly simple, any one can see, thus to treat disease of the *throat, bronchial pipes and lungs*. How much better this method, by which remedies are conveyed directly to the seat of the disease, than to resort to the uncertain and too frequent *mischievous action* of medicines taken into the stomach.

THE COLD AIR INHALING BALM.

This part of my treatment I regard as very important, especially in warding off colds (which is a full half of the battle), and in relieving the head and lungs while under their effects. The Balm is composed of several kinds of gums, balsams, firs and essential oils, which are separately used by the best physicians in treating throat, bronchial and lung diseases. These I have combined and concentrated their virtues, which, by the inhaling process, are drawn through the various air passages of the head and respiratory organs, reaching and healing every irritated spot. If used when cold first makes its appearance—which usually begins by an irritation of the mucous lining of the nose, and a sneeze, which is *nature's emphatic warning*—it will, most invariably, check it, and by producing a quicker circulation and by throwing the blood to the surface, the bad effects of a cold are warded off. It is withal pleasant to use and almost instant in its effects.

MY EXPERIENCE.

Eighteen years of terrible headache, disgusting nasal discharges, dryness of the throat, acute bronchitis, conghing, soreness of the lungs, raising bloody mucus, and even night sweats, incapacitating me for my professional duties, and bringing me to the verge of the grave—ALL caused by, and the results of NASAL CATARRH. After spending hundreds of dollars, and obtaining no relief, I compounded my CATARRH SPECIFIC AND COLD AIR INHALING BALM, and wrought upon myself a *wonderful cure* Now I can speak for hours with no difficulty, and can breathe freely in any atmosphere. At the calls of numerous friends, I have given my cure to the public, and have now thousands of patients in all parts of the country, and thousands of happy fellow-beings whose sufferings I have relieved My cure is *certain, thorough and perfect*, and is indorsed by EVERY PHYSICIAN who has examined it. If I can relieve my fellow-beings as I have been relieved of this loathsome disease, making the possessor at once disgusting to himself and others, I shall be satisfied, and feel that I have done my little toward removing the ills of mankind T. P. CHILDS

OTHERS TESTIMONY.

FROM THE CHANCELLOR OF THE UNIVERSITY OF NEBRASKA.

T. P. CHILDS—*Dear Sir:* I think you have the true theory and practice for the cure of Nasal Catarrh, and also for the treatment of the respiratory organs. My throat is now so well restored that I lecture daily without difficulty, and I find no difficulty whatever in preaching. You are at full liberty to use my name for the benefit of others.

Yours very truly. E. B FAIRFIELD, D. D., LL.D., Lincoln, Neb.

JUDGE J. COLLETT of Lima, O., writes:—"You well remember how terribly Catarrh had taken hold upon me at the time you were at my house, making me offensive to myself and to all around, and withal suffering day and night. I began to use your excellent remedy about the 26th of August, and withal suffering day and night. I began to use your excellent remedy about the 26th of August. Now I am cured; head free, air passages all open, and breathing natural. I express to you again what I said in a recent letter, 'A thousand thanks to you for so safe a remedy, and so very cheap.' I have laid away the instrument, having no further occasion to use it. Thus in about six weeks I have accomplished what you thought could be gained in from three to six months." (P. S.—Write to him.)

MR. T. GILLESPIE of Woodworth, Kenosha Co., Wis., writes:—"I must say that I never had a medicine take hold of my Catarrh by the root, and *root* it out, as this has."

MR. THOMAS J. DAILY of Homer, Champaign Co., Ill., one of the worst cases I ever had under treatment, who was six months bed-fast, and nearly blind, and one eye utterly destroyed by Catarrh, nose and face much disfigured, and throat and lungs in a critical state, writes, June 21, 1878:

"DEAR MR. CHILDS:—I have used your Catarrh treatment, that my brother, B. O. Daily, of your place, kindly sent me, now over three months, and almost all this time in hopelessness, as it did seem I must die. By and by it began to take effect, and I began to have hope. I improved rapidly, soon could sit up, passages of the head began to open, throat and bronchial tubes grew better, cough ceased, and now I can see to write. I now expect to get well and go about my business again. I owe you a great debt of gratitude. Indeed, I owe my life to your treatment.

THOMAS J. DAILY."

"Very truly your friend,

P. S.—Mr. D. is now (Sept. 10) in Troy, looking quite well; almost every vestige of Catarrh has disappeared.

REV. MR. RECORD of Convoy, O., says:—"No amount of money would tempt me to be placed back into the misery and wretchedness I was in when I began to use your Specific."

MRS. W. D. LINCOLN of York, Neb., writes:—"My health is fully restored. The horrid and loathsome disease is all gone."

CONCLUSION.

It is now a well-established fact that Childs' Catarrh Specific, for thoroughness, completeness and efficiency, has no equal in the world. Everything known to be good for Nasal Catarrh in all its horrid forms, in the head, throat and bronchial tubes, arranged into one complete system of treatment. Two kinds of inhalants and two fine inhalers go with each full course of medicine.

Do not trifle with some cheap thing, which at best can afford but temporary relief, while the roots of the vile disease are left to strike deeper and deeper. Be in *earnest* and *thorough* or do *nothing!* Write at once and say what paper you saw this in. Circulars, Price-Lists and all necessary information can be had by addressing (with return stamp),

REV. T. P. CHILDS, Troy, Ohio.

Reading for the Young.

THE CATTLE TRAIN

SHUT in from pure and boundless air.
That lately round them flowed,
From wanderings free in pastures fair,
They come a hapless load.
Close huddled, on their weary feet,
They waver to and fro,
As thundering on, with boundings fleet,
Their cruel prisons go.

Their great, good eyes look mildly out
Between the wooden bars,
As clattering o'er the long, long route
Sweep on the freighted cars,
Past pastures green as those they knew,
Past cattle feeding there,
Past tempting streams and rivers blue,
Past all things dear and fair.

Yes past for these are all things bright;
Their day of doom has come;
Farewell to life, farewell to light,
Ye sentient beings dumb.
—Yet we who speak your wild, mute woe
Are scarce more blest than ye;
Our hope but strives less dark to show
That death ye do not see.

THE CATTLE TRAIN.

THIS incident was related some years ago by Miss L. M. Alcott, the well-known author.

Somewhere above Fitchburg, as we stopped for twenty minutes at a station, I amused myself by looking out of a window at a waterfall which came tumbling over the rocks and spread into a wide pool that flowed up the railway. Close by stood a cattle train; and the mournful sounds that came from it touched my heart.

Full in the hot sun stood the cars; and every crevice of room between the bars across the doorways was filled with pathetic noses, sniffing eagerly at the sultry gusts that blew by, with now and then a fresher breath from the pool that lay dimpling before them. How they must have suffered, in sight of water, with the cool dash of the fall tantalizing them, and not a drop to wet their parched mouths!

The cattle lowed dismally, and the sheep tumbled one over the other in their frantic attempts to reach the blessed air, bleating so plaintively the while that I was tempted to get out and see what I could do for them. But the time was nearly up, and while I hesitated, two little girls appeared and did the kind deed better than I could have done it.

I could not hear what they said, but, as they worked away so heartily, their little tanned faces grew lovely to me in spite of their old hats, their bare feet and their shabby gowns. One pulled off her apron, spread it on the grass, and, emptying upon it the berries from her pail, ran to the pool and returned with it dripping, to hold it up to the suffering sheep, who stretched their hot tongues gratefully to meet it, and lapped the precious water with an eagerness that made little barefoot's task a hard one.

But to and fro she ran, never tired, though the small pail was soon empty; and her friend meanwhile pulled great handfuls of clover and grass for the cows, and having no pail, filled her picking-dish with water to throw on the poor dusty noses appealing to her through the bars. I wish I could have told those tender-hearted children how beautiful their compassion made that hot, noisy place, and what a sweet picture I took away with me of those two little sisters of charity. "Blessed are the merciful for they shall obtain mercy."

ENGLISH LITERATURE.

SOME months ago I wrote you about a very famous author. By this time I suppose you have found out his name, if not, I must tell you that this man with a short, thick body, a face disfigured by small-pox was—well, now girls who was he? Oliver Goldsmith? Yes, to be sure. Have you time now to read something about another man, who wrote a number of books? As I can hear neither your "yes," nor your "no," I will write something for "yes" and beg "no" not to read it. That is fair, isn't it girls and boys, or are you all girls? I don't know whether boys care much about literature. I think they ought to do so, when it is of their sex we write. Another time, I think I must take a woman for my heroine.

This evening, for "Blue Monday" is over and I am writing to you by gas-light,—one which, by the way, is very far up towards the ceiling, as I have not a drop-light. I sometimes almost wish for an old-fashioned kerosene lamp,—but this is a great digression;—it is almost enough to make our poor, dear old author turn in his grave, that I should so far forget myself and him as to wander off to those highly prosaic and unromantic affairs, kerosene lamps. So no more of them. Let them remain quietly where they belong, only I do wish I had one!

This author of whom I shall write to you, was born in Litchfield, England, Sept. 18th, 1709. He received his early education of a man named Hunter, of whom he said, "He beat me well," adding, "without that, however, I should have learned nothing."

In 1728, he went to Pembroke College, Oxford, having been engaged for the two previous years of his life in learning his father's business of bookseller. It is said that books of his binding are still extant.

In 1736 he married a widow, a Mrs. Porter. A year later he went to London, where he wrote for the "Gentleman's Magazine." One of his books, Rasselas, was written to pay the expenses of his mother's funeral, to use his own words, "It was written in the evenings of a week." He was a very eccentric man, as you will see, this hero of ours. One day, on entering Sir Joshua Reynolds's studio with a blind lady, he quit her hand, whirled about on the doorstep, then gave a sudden spring, made an extensive stride over the threshold, as if trying for a wager how far he could step. Being one day invited to a dinner-party, he did not make his appearance until the party were about to sit down to the table. Then he appeared at the great gate, contemplated it, and, at length, climbed it. When asked if he had forgotten to open the gate, he said, "No, but I had a mind to try if I could climb a gate now as I used to do." Two lady admirers once visited him in Bolt Court. One had prepared a very elaborate speech which she delivered with much satisfaction to herself. When she had finished he merely said, "Fiddle-de-de, my dear!" (I have always felt sorry for that lady.)

THE CATTLE TRAIN.

Then our Mr. —— had an odd fashion of treasuring up bits of peel, and when walking through the streets he would touch every post he passed with his cane; if by chance he overlooked one and was reminded of his mistake, he would turn back several blocks and rectify matters. A queer man, was he not? and yet he wrote some very good and valuable books, among the number, "The Vanity of Human Wishes," "The Lives of the Poets" and a Dictionary; then he wrote for "The Rambler" and "The Idler," both periodicals.

From an entry made in his diary we find he read one book of the Æneid in an evening, and knew the Eclogues by heart.

In 1773 he made a tour to the Western Isles of Scotland, of which he gave an interesting account. As a man, he was, in mind as in body, powerful and rugged, but he was capable of acts of benevolence and of substantial generosity. Indeed, at one time he supported four or five poor creatures, who, but for his aid, would have been obliged to seek refuge in an almshouse; yet these people were sometimes very ungrateful to —— for all his benefits. "Strength, or at least force of mind, a certain sage solemnity in the treatment of moral themes, a sharp eye for the observation of character as it manifests itself in society, and a great power of caustic wit, are the chief qualities noticed in ——." He had good sense and solid judgment.

Now as the clock strikes nine, it is quite time I should tell you when our Mr. —— died. He died December 13, 1784, and was buried in Westminster Abbey.

I leave his name to be found out by the bright girls and boys. SANS SOUCI.

The Puzzler.

CHARADE.

My first comes in the pleasant spring,
When merry birds begin to sing;
My second, I am very sure,
Is used by all, both rich and poor.
To receive my whole is very pleasant,
It oft contains some valued present.

Sabbath Reading.

THE TRIAL OF JESUS CHRIST.

Jesus was finally condemned for "blasphemy," because he made himself the Messiah and the Son of God, making thus higher personal claims than even the witnesses against him had suggested. That was the crime, therefore, towards which one of the intended accusations—that as to superhuman power—may be held to have pointed. But what of the other? The unexpected but satisfactory answer is that it fell under precisely the same legal category, that of blasphemy. This might be suggested to us by the witnesses against Stephen, who describe as "blasphemous words" the deliberate utterances of the deacon as to the passing away of the holy place and the law. But I believe that it will be found there is no Hebrew category of crime under which the attempt to supersede the old institutions could so naturally come as that denoted by the term blasphemy. The witnesses, therefore, may have had this somewhat in view from the beginning, as the judges almost certainly had; and it is not too soon to devote a few sentences to the question what so important a legal word means.

Blasphemy is not profanity—it is profanity which, as the name imports, strikes directly against God. This is the original sense of the word, and it is that to which we have returned in modern days. But throughout the countries of Europe, ruled by civil and canon law, blasphemy has long since taken on a secondary and constructive meaning. Now whether it is a necessary thing for ordinary nations and jurisprudences to have in their statute-book such a crime as treason against God at all, we need not inquire. One thing is certain. In the Hebrew commonwealth and under Hebrew law it was necessary. For that commonwealth was the one pure theocracy, and all its priests, prophets, judges, and kings were the mere courtiers and ministers of the invisible king, whose word was Israel's constitution and law. In such a constitution blasphemy, or the verbal renunciation of God, was in the proper sense high treason; and any attempt to subvert the great institutions of his government was constructive treason. Now neither the crime of the "false prophet" of the true God, nor that of "the idolator" or seducer to the worship of strange gods, seems to have attained to the generality and eminence of the name blasphemy in Jewish law. That the word was used in the age of Caiaphas to designate alleged attempts against the divine system of religion is certain.

We cannot therefore hold, as has sometimes been done, that these witnesses brought forward a special and isolated charge with regard to the temple, and that on the failure of it the council passed unfairly to other and disconnected counts. The special charge was at least in the line of the whole procedure contemplated. For unless we are to become wholly unhistorical in our legal criticism, we must believe that the general course of this night's proceedings was prearranged by the leading members of the Sanhedrin, and that they and not the witnesses really conducted the prosecution. The evidence is overwhelming that at repeated meetings of what the fourth Gospel even calls a council, and what may have been formal meetings of the acting committee of that body, the suppression and if need be the death of Jesus had been resolved upon. And in these preliminary proceedings it was not merely his acts as a prophet or as an opposer of existing institutions that were deliberated upon. His claim to be the Christ, and even (as his nearer followers had long ago acknowledged him to be) the Son of God—whatever that mysterious claim might mean—had during the second part of his career pressed heavily upon the Hebrew conscience, especially in Jerusalem.

The evidence, all agree, was not found sufficient—perhaps not found "relevant"—to infer a conviction upon it alone. The rule of law in such a case was clear, that the accused must be at once liberated. And even had the inculpatory evidence been found sufficient, the next step by the rules of the court was to call witnesses for the defence. Such a proposal would of course have been a mockery in a trial at such an hour. What was actually done was an attempt to cross-examine the accused. "Answerest thou nothing? What is it which these witness against thee?" are the exact words of the high priest repeated in two of the narratives. But he "held his peace, and answered nothing." The interrogation was unlawful. But I am not able to represent this silence as caused by indignation at the errors of the accusers, or the unfairness of the judges. That the ordinary rights of every accused Hebrew had been present to the mind of Jesus we have already seen. But that he had any expectation of escaping, or even any desire at this stage to do so, there is no evidence whatever. All the narratives combine to show that he had for some time been consciously moving on to a tragical and tremendous close of his brief career. His utterances in anticipation of it during the previous weeks, and especially on the preceding day, have held the world spell-bound in each succeeding generation. A similar hight of self-possession marks him at this final hour. The inaccurate or malicious recollections of what he had said three years before were nothing now to him. He had not come to Jerusalem to perish by a mistake; and if we are to fill that silence with thoughts at all, we may suppose that they had reference to the scene that now surrounded him. For there, at last, were gathered before him, the children of the house of Israel, represented in their supreme council and great assembly. To this people he had always held himself sent and commissioned. Now at last they have met; and all the ages of Israel's past rise in the mind of him who stands to be judged—or to judge.

At what hour the great concluding scene, so vividly described by three of the Evangelists, took place, it is impossible to say. Plainly enough, the private and public examinations of the witnesses must have occupied a considerable time, and whether or not these had been attended by "all the council," or a portion of its members, it is quite certain that by this time—at the point where these examinations were continued—a large number of the "great Sanhedrin" was met. The members of that body numbered seventy-one; the "little Sanhedrin," which was probably a committee or cabinet formed out of the larger, numbered only twenty-three. It is very possible that the smaller body may have been summoned at a somewhat earlier hour by Caiaphas, and it may be that no other ever assembled. Still the narratives rather suggest that the great council, which alone could at this time try a man for his life, and which alone could at any time judge a prophet, was also called. Let us concede to the language of the Evangelists that so much of the law was observed. We must, in that case, imagine the council as sitting in the hall Gazith, half within and half without the holy place.

It was they, the zealots of the council, who, no doubt, took the initiative in the extraordinary and tumultuous scene which closed the sitting. During the later examination of witnesses Jesus had been silent; but the thought of his Messianic and divine claim pressed upon his judges with overwhelming force, and broke out at last into passionate utterance. The discrepancy between the Evangelists at this point only brings out the whole scene more historically. "Art thou the Christ? tell us," they cried; and the irrepressible exclamations of the judicial crowd described in one Gospel were only put an end to by the solemn adjuration of their president, recorded in another. To the eager and hostile questions of the council, Jesus answered at first in a twofold utterance—"If I tell you, ye will not believe." Was he thinking sadly of their forgotten duty to weigh his claims, and of a result to himself or to them? But he adds, "And if I also ask you," as he had done a few days before in the temple, when they had demanded his authority, "if I, instead, put my questions to you, ye will not answer me, and ye will not release" your prisoner. It was true; but the council was long past being turned from its purpose by the reference which, I think, these words again have to judicial fairness and the order of justice. They saw in his face the light of that more than earthly claim which his lips only for a few moments delayed to make; and with a mixture of terrible and hateful emotions, starting to their feet, "then said they all, Art thou then the Son of God?"

But above that crowd of aged and evil faces was now seen rising the high priest of Israel, and all voices sank away as the chief magistrate and judge of the sacred nation demanded, in the name of the God whose office he bore, an answer to his most solemn adjuration, "I adjure thee by the living God, that thou tell us whether thou be the Christ, the Son of the Blessed!' It was the question for which men had waited so long; and now the answer came. "I am," the Christ, the Son of God: and, turning to the crowd who sat in their places of power around him, he added, "Hereafter shall ye see the Son of Man sitting on the right hand [of power, and coming in the clothes of heaven." When a king declared himself in Israel, the manner was that he stood in the temple by a pillar, and the people of the land receiving him rejoiced with hosanna and song, with palm-branch and with trumpet. And if this was the manner of a king, how should the King-Messiah be received? But when a man blasphemed the name of God, the ordinance in Israel was that every man who heard it should rend his garment from the top downwards—rend it into two parts which might again never be sewn into one. And scarcely had Jesus witnessed his confession before those "many witnesses," when the high priest standing in his place, rent his clothes, saying, "He hath spoken blasphemy; what further need have we of witnesses? Behold, now ye have heard his blasphemy, What think ye?" And they answered, and said, "He is IEH MAYETH—a man of death." . . . "Then they all condemned him to be guilty of death."

So passed that great condemnation.

But our conclusion on the question of Hebrew law must be this: that a process begun, continued, and apparently finished, in the course of one night; with witnesses against the accused who were sought for by the judges, but whose evidence was not sustained even by them; commencing with interrogatories which Hebrew law does not sanction, and ending with a demand for confession which its doctors expressly forbid; all followed, twenty-four hours too soon, by a sentence which described a claim to be the fulfiller of the hopes of Israel as blasphemy—that such a process had neither the form nor the fairness of a judicial trial. But though it wanted judicial fairness and form, it may nevertheless have been a real and important transaction. There is no reason to think that the council mistook the claim of Jesus. And there is every reason to believe that their condemnation truly expressed the nation's rejection of his claim.

PERSONAL ITEMS.

The Sultan of Turkey is thirty-six.

Commodore Vanderbilt's widow has to get along on $1,000 a week.

Capt. Eads estimates the loss of business by fever in the South at $200,000,000.

The Marquis and Marchioness of Lorne intend sailing for Halifax from England on the 14th of November.

Ex-Gov. Horatio Seymour has prepared an article on the cheese industry for the next number of the North American Review.

Thomas Carlyle, in his old age, says he reads the Lord's Prayer with increasing pleasure, and adds: "What else can we say?"

George Gorham, secretary of the Republican Congressional campaign committee, is quite seriously sick with some kind of kidney complaint.

Confederate Major-General Stockton, who has enlisted as a private soldier in the Federal army, has been detailed to a clerkship in the War Department at Washington.

Mr. Bancroft, the historian, is a rigid tetotaler, and firmly refused, in his great pain and exhaustion after the recent runaway accident, to taste the wine prescribed by his doctors.

The Marquis of Lorne, in his farewell address to the electors of Argyleshire, said that not one of his constituents had ever written him on any subject that the communication was not answered by the next post.

Count William Bismarck, the son of the Prince, and the youngest member of the Reichstag, is a jovial, hearty-looking person, so clever that he would have a future before him even if he were not the son of so powerful a man.

The estate of the late James Goodwin of Hartford, who was considered the wealthiest man in Connecticut, after the settlement of the administrator's accounts, has merely a balance in personal property amounting to $1,750,000, besides $500,000 in real estate.

General Sherman returned to Washington on Monday last from his extended trip West and to the Pacific Coast. He is in excellent health and speaks in high terms of the various posts which he officially visited, referring to them as models of neatness and efficiency.

"He was, in his friendly and scientific and business relations, in every case what we Americans would call 'a level-headed man,'" is what Dr. Hayes says of Dr. Petermann, when asked if he had ever perceived any appearance of insanity in the great geographer's letters.

Mr. Richard Rogerson, of Liverpool, is spoken of as a model English workingman. He is seventy-seven years old, and has worked in a foundry for one firm for the last sixty-six years. He has had fourteen children, forty-two grand-children, and twelve great-grand-children.

There is some criticism of the Queen's treatment of the Princess Beatrice, who is 21, pretty, full of life and capable of enjoyment, and who is still kept at the old lady's apron strings, accompanying her in all sorts of dismal journeyings, and being dressed in a dowdy style.

Senator Bayard is accredited with saying that in his opinion there will be three Presidential candidates in the field in 1880—the Republican, Democratic and Greenback candidates. It is possible, too, that the House of Representatives may be called upon to elect the next President.

Mr. Beecher was badly beaten at croquet every time he played in Minnesota. And now some people go so far as to say that this is a proof that Mr. Beecher will not lie and cheat. He may get a little mad sometimes, they say, but he lacks the qualifications of a successful croquet player.

Each Speaker of the House of Commons receives a pension of $20,000 a year, with remainder to his eldest son, at whose demise it terminates; but there is only one ex-Speaker—Viscount Eversley, Charles Kingsley's friend and neighbor—who has such pension, and he has no son. His successor, Mr. Denison, created Viscount Ossington, refused a pension. He died childless.

General Fremont says that his Indian policy, as Governor of Arizona, will be to interfere with those agreeable gentry as little as possible so long as they do nothing to retard the development of the Territory. The General is said to show few signs of his sixty-five years. His health is good, he is erect, and has the same nervous, quick motions as of old, and the same frank manner. His hair and beard are almost white.

When Mehemet Ali Pacha, who was murdered lately, was in Berlin, he took the opportunity to visit his birthplace, Madgeburg. Here he was so touched by old reminscences that he declared that he should lay down his military duties in Turkey as soon as possible, again become a true German and settle for the remainder of his life in some pleasant town in the Harts. As Gen. Noble, and more than one before him, have remarked, "Man proposes, but God disposes."

Gustaf Wallis, the most eminent of traveling botanists, died at Cuenca, Ecuador, last June. In 1860 he was commissioned by some very eminent Belgian horticulturists to gather new varieties of plants in South America, and for eight years traversed vast districts in that country, making subsequently an excursion, at the instance of a great London firm, to the Phillippine Islands. He died in a hospital, worn out and poor, in the cause of science, having given to European horticulture not less than 1,000 transatlantic novelties.

Five noble and wealthy English Roman Catholic girls are about to take the veil and become nuns, all having considerable fortunes in their own rights. They are Lady Edith Noel, daughter of the Earl of Gainsborough; the Hon. Constance Howard, sister of the Marchioness of Bute; two daughters of the Hon. Maxwell Stuart of Traquhar, Peebleshire, and the youngest daughter of Mr. Blount of Maplequrham, the representative of the staunchest Catholic family among the commoners in England.

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose, WE ISSUE SEMI-ANNUAL EDITIONS OF
AYER & SON'S MANUAL
FOR ADVERTISERS. 164 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of 25 cents by N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in premiums o All

Wit and Humor.

THE POLITICAL "SONS OF TOIL."

"Feller-citizens," said he, "I'm a hard-fisted son of toil. I'm a bricklayer by trade, and not a bit ashamed of it. No, *sir;* I wasn't born with a silver spoon into my mouth or cradled in the lap of luxury. I'm a self-made man, gentlemen.

"You'd better have let out the job," remarked a voice in the rear of the hall.

He scorned to notice the interruption, but proceeded.

"Yes, feller-citizens, I'm proud of having risen by honest industry, proud of appearin' to solicit your suffrage as a true representative of labor; as one which has contributed to build up this community by the sweat of his brow, and the work of his hands. [Applause.] As I was saying, I'm a bricklayer by trade. I've worked to raise more than half the palatial mansions, magnificent commercial structures, and heaven-pointing spires which beautify and adorn our town. [Great enthusiasm.] And here, right here, gentlemen, are the identical tools with which I have carved out my way to prosperity."

Here the orator examined a trowel and hammer, amid deafening plaudits.

"Pass 'em this way," said an excited listener, evidently belonging to the working class; "let me gaze onto them relics."

The tools were handed to him, and he scrutinized them with deep interest.

"You say you work as a bricklayer?" said he, turning sharply to the orator.

"Yes."

"And with them tools?"

"Yes, sir; those are the very tools I bought when I made my first start as a journeyman. To them I owe all my prosperity."

"Well, then, I must say you deserve great credit. So does any man that could lay bricks with such weapons. Gentlemen," turning to audience, "just look at 'em. *It's a gardener's rowel, and a carpenter's hammer!*"

Tableau!

A HEATED lover wrote a letter of the same to his inamorata last week, beginning, "Sweatest." She will be a sister to him hereafter—nothing more.

"IT'S a poor rule that won't work both ways" is supposed to have originated with the schoolboy who took the rule away from his teacher and knocked him down with it.

MRS. PARTINGTON says the only way to prevent steam-boat explosions is to make engineers bile the water on shore. In her opinion all the bustin' is done by cooking the steam on board.

A DREAMY writer says it would be curious to follow a pound of silk from its spinning until it becomes a lady's dress. No doubt; but most men would prefer to follow it after it becomes a dress, and while the lady was in it.

WHEN a Hartford woman patted her friend's seven-years-old youngster on the head and said: "I should like to have such a little boy as you are," he looked up into her face and replied; "Well, I guess you can; I don't b'lieve God's lost the pattern of me."

"IT seems to me," said a customer to his barber "that in these hard times you ought to lower your prices for shaving." "Can't do it," replied the barber. "Now a-days everybody wears such a long face that we have a great deal more surface to shave over."

From Acute to Chronic

Is an easy stage in cases of dyspepsia. A slight attack of indigestion, especially when there is a predisposition to digestive weakness of the stomach, must speedily culminate in the more obstinate form of the disease. It is well, therefore, to adopt preventive measures early. Although Hostetter's Stomach Bitters overcomes, if persisted in, cases of dyspepsia of long standing, it is obviously the part of wisdom to use it ere the malady assumes a chronic phase. This is particularly true, because as dyspepsia advances, it engenders other bodily evils, such as disorder of the liver, constipation or undue looseness of the bowels, nervous disorders, hypochondria, sleeplessness. These maladies are both prevented and remedied by the Bitters, but how much better to check them in their outset with the great alterative, than to wait until they establish a firmer foothold in the system. Surely the advisability of this must be apparent.

PIANOS AND ORGANS AT FACTORY PRICES. Great Reduction to close out present stock of 200 New and Second-hand Instruments of first-class makers, fully warranted, and at prices that DEFY COMPETITION, for cash or installments. AGENTS WANTED for WATERS' SUPERIOR BELL ORGANS and PIANOS. Illustrated Catalogues Mailed. HORACE WATERS & SONS, Manufacturers and Dealers, 40 East 14th St., N. Y. Also General Agents for SHONINGERS' Celebrated ORGANS and PIANOS. The SHONINGER ORGANS have obtained at the Paris Exposition a brilliant triumph, and the judges have awarded them a medal for their Organs. Their Illustrated Catalogue mailed.

RICKETTS'S GRAPES.

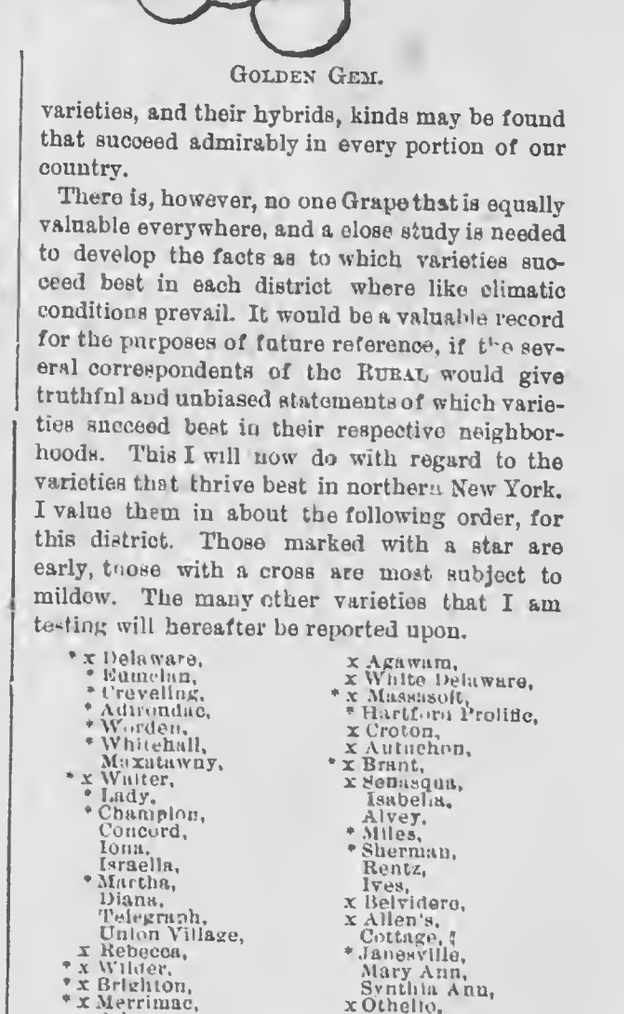
During the past few years hundreds upon hundreds of seedling Grapes have been raised—we might say, perhaps, thousands upon thousands, and there are but a few varieties for which even the claim is now made of superiority over old sorts. Among Hybrids, Mr. Ricketts's varieties have claimed a large share of public interest and admiration as they have been exhibited at our chief fairs for several years past. Many of them are beautiful to look at; many are all that could be desired for eating qualities. But are they fit for general cultivation? Nobody can answer this question. Except Lady Washington which is now offered for sale, a life portrait of which was presented in this journal of Nov. 10, 1877, the public as yet has had little opportunity of knowing anything about their adaptability to different situations and climates. Mr. Ricketts, several years ago, sold his Secretary which, we believe, is now offered by certain nurserymen. This is a black grape ripening with the Concord. The bunches are very large and it has proved with us very fruitful, but there seems no special merit about it that will insure its widespread popularity. Several other of his varieties were sold to Messrs. A. HANCE & SON of Red Bank, N. J., specimens of which were by that establishment sent to us for trial. Their names are El Dorado, Don Juan, Newburgh, Advance Quassaic, Imperial and Highland, none of which has as yet fruited. Lady Washington, as we stated in the RURAL above referred to, is a glorious grape both in taste and appearance ripening with the Concord. The vine is vigorous, hardy (according to Mr. Downing) and productive. The bunch is compact, generally double-shouldered; berry medium to large, round, color deep yellow with a tinge of delicate pink where exposed to the sun, and covered with a thin white bloom. Flesh tender, soft, sweet and very good. Still, confident hopes are entertained by many that the best of Mr. Ricketts's varieties will prove superior to any yet known among us, and we have therefore requested from him specimen bunches of such as he chose to send, that we might place them before our readers.

Concord No. 1 (see cut, p. 679) is a hybrid between Concord and Black Muscat of Alexandria. The bunch is large to very large. Berry is black, oval, irregular in size, the small without any seeds. Flesh melting, juicy, rich with a strong Muscat aroma. Foliage large, lobed, serrated, with the appearance of the foliage of native kinds. This may prove a first-class Grape for the amateur.

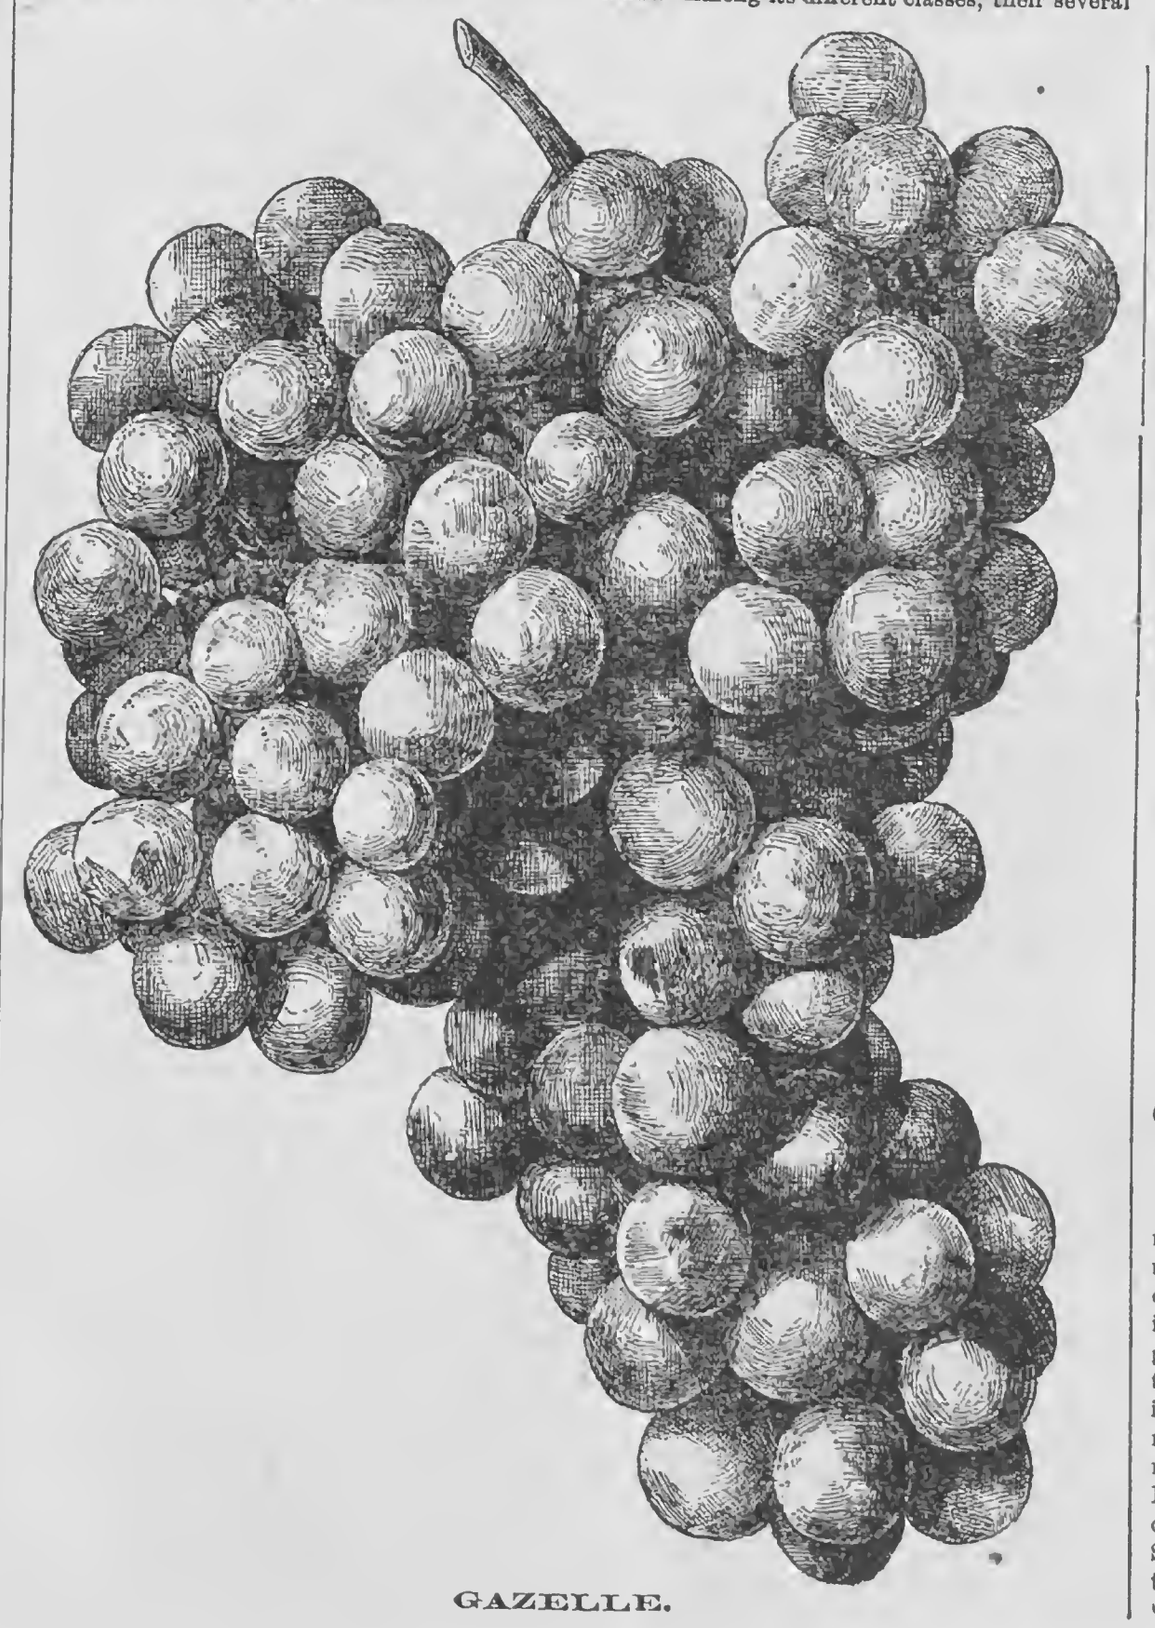
GOLDEN GEM (see cut) is a seedling of Clinton and Delaware. Bunch small, shouldered; berry, oval, size of the Delaware. Flesh soft, melting, with a racy flavor not to be found in any other grape we have ever tasted. Foliage like Clinton. This is ripe with Hartford and is perfectly hardy on Mr. Ricketts's ground.

GAZELLE (see cut below) is a hybrid between Israella and Tokay. Bunch large to very large; berry large, white, oval; flesh juicy and rich with a texture peculiar to the Chaselas grapes; foliage much like Isabella. This also will probably prove an excellent amateur variety.

WAVERLY (see cut p. 679) is a hybrid between one of the Muscats and Clinton. Mr. Ricketts emphasizes the hardiness of this variety. Bunch medium size, shouldered; berry medium black with a gray bloom. Flesh soft, juicy with a fine aromatic flavor. This he considers one of his best hybrids. It has fruited for about twelve years and no disease of any kind upon fruit or vine has ever been observed.



GOLDEN GEM.



GAZELLE.

NOTES ON VARIETIES OF GRAPES.

D. S. MARVIN.

OUR crop of native grapes is fast becoming next in importance to the apple crop. This beautiful and healthy fruit has an older history than any other one of our cultivated fruits. More sentiment, and more poetry are connected therewith than with any or all other fruits. It has also its intimate relations with our religion, for its relations are so close and tender with the Saviour, the apostles and Biblical heroes that the study of the grape is a part of the study of man and the Christian religion.

Mr. Longworth was of the opinion that Cincinnati was near the northern limit of successful grape culture, but I have twice received first premiums at the Cincinnati Exposition for grapes grown upon the forty-fourth parallel, and year by year we find the cultivation of the grape advancing northward, for the reason that the vine there finds less mildew to encounter, while the abundance of tropical heat during our short summers ripens in great perfection our early varieties. Indeed this splendid fruit seems designed by Divine Providence for cold climates as well as for warm ones, because its flexible trunk enables the husbandman to bend it down and give it winter protection.

As the Grape's greatest enemy is mildew, it must be grown upon well-drained and high lands. Among its different classes, their several varieties, and their hybrids, kinds may be found that succeed admirably in every portion of our country.

There is, however, no one Grape that is equally valuable everywhere, and a close study is needed to develop the facts as to which varieties succeed best in each district where like climatic conditions prevail. It would be a valuable record for the purposes of future reference, if the several correspondents of the RURAL would give truthful and unbiased statements of which varieties succeed best in their respective neighborhoods. This I will now do with regard to the varieties that thrive best in northern New York. I value them in about the following order, for this district. Those marked with a star are early, those with a cross are most subject to mildew. The many other varieties that I am testing will hereafter be reported upon.

* x Delaware,	x Agawam,
* Eumelan,	x White Delaware,
* Creveling,	* x Massasoit,
* Adirondac,	* Hartford Prolific,
* Worden,	x Croton,
* Whitehall,	x Autuchon,
Maxatawny,	* x Brant,
* x Walter,	x Senasqua,
* Lady,	Isabella,
* Champion,	Alvey,
Concord,	* Miles,
Iona,	* Sherman,
Israella,	Rentz,
* Martha,	Ives,
Diana,	x Belvidere,
Telegraph,	x Allen's,
Union Village,	Cottage,
x Rebecca,	* Janesville,
* x Wilder,	Mary Ann,
* x Brighton,	Synthia Ann,
* x Merrimac,	x Othello,
x Salem,	x Catawba.

Jefferson Co., N. Y.

GRAPE NOTES FROM NORTH CAROLINA

M. B. PRINCE.

THE reader must bear in mind that these remarks are only intended to apply to this immediate vicinity, and may or may not be true of other localities only a few miles away. For instance, less than ten miles from this place grapes have rotted to a serious extent during the past two seasons, no variety entirely escaping, while in my own vineyard but little rot was noticed last year, and then only on a few varieties, and there has been none at all this year. In preparing this article I acknowledge the aid of the pioneer in grape culture here, Mr. Henry Smith, who has spent the best part of a lifetime in the vineyards of France, a few years on the shores of Lake Erie, and the past seven years

in North Carolina. His vineyard of 30,000 vines I have frequently visited during the past two years.

The Grape hereabouts is subject to fewer diseases and those of a less serious nature than in almost any other part of the United States if not of the world. Planted, as many are, on poor, worn-out land, with no manure of any kind, they grow finely, producing good crops of fruit. In our

METHOD OF CULTIVATING,

the proper distance apart, at which to plant the vines, we find to be six feet each way. The most common manner of training is to put one stake to a vine, though some prefer two. Two canes are usually allowed to grow to the top of the stake and are rather closely pruned. Wire trellises are taking the place of stakes to some extent, and are much to be preferred. Although the first cost is more, the increased production of the vines, and the greater durability of the supports will cover the extra expense. The cultivation given is merely plowing under the weeds and grass in September, cleaning up the rows with the hoe, plowing again in April, and sometimes we get through them in May with the cultivator or harrow. As to

VARIETIES CULTIVATED,

we can say that all American Grapes, so far as tested, prove hardy and productive here; but all Hybrids of Vitis vinifera are defective in one way or another. As yet, we have only to consider two important traits, namely, the best possible flavor combined with enough firmness to bear transportation to Northern markets, and also fruit that will yield a fine quality of wine.

IVES' SEEDLING is the most reliable as yet found, for shipping.

THE HARTFORD ripens about the same time, is a little larger, but it lacks the tough skin. The gentleman mentioned above is testing the newer varieties in a small way.

THE BELVIDERE he so far thinks destined to supersede the above two kinds for shipping.

PERKINS, a few days later, is a strong, healthy grower and a profitable market grape.

MARTHA AND LADY, vigorous and productive, ship well when not fully matured.

THE SIGLAR, a variety received from Canandaigua, N. Y. and known here by the above name, promises to take the place of the slow-growing and not very prolific Delaware, being of as good flavor, larger berry, as well as strong and luxuriant in its growth,

CONCORD here, as almost everywhere, grows well, but it has the fault of cracking badly.

THE CONCORD SEEDLING which, as its name indicates, is a seedling of the Concord, having all the good qualities of its parent with twice the size of berry and clusters often weighing two pounds, promises to fill a prominent place as a table fruit for home use.

ROGERS' HYBRIDS all rot more or less.

ISABELLA is also liable to be similarly affected.

CATAWBA sometimes is specked but generally proves good.

NORTON'S VIRGINIA, among wine Grapes, gives the best promise.

Although all the varieties cultivated here make a fine claret, the market is so well supplied with "alum and logwood," and many other vicious compounds, that the pure juice of grapes goes begging; still we look for an appreciative acknowledgment of the superiority of our native wines at no distant day. We can produce a pure wine of fine quality for less than one dollar per gallon, delivered in any of our large cities. On elevated land well drained either naturally, as nearly all such land is, or artificially, the Grape is extremely vigorous and healthy. It is on the low lands, more or less wet, that the rotting occurs in nearly every instance. Phylloxera, leaf rollers, thrips, mildew and leaf blight are of rare occurrence, the latter being confined almost entirely to Diana.

It is not surprising that fruit growers should become discouraged in trying new varieties after paying high prices for one after another as they follow in quick succession, to be cast aside as worthless in nine localities out of ten. Still the cry is, "something a little better than what we already have," and the offers to supply this want are numerous. The originators, no doubt, as a rule, honestly believe they have found the thing wanted; but in most cases the new acquisition proves but ill adapted to any locality except the place of its birth. I would not pluck a single leaf from the nobly won laurels of those who have the perseverance and patience necessary to the production of improved varieties of fruit or of anything that increases the comfort and happiness of their fellow men. But it seems to me that it would be well for more of the originators of new fruits to follow the lead of those who have distributed a few of their plants for trial in different parts of the country, and await the results before offering them for sale. Such a course would save much disappointment.

Brookston, Warren Co., N. C.

EVILS OF SELLING UNRIPE GRAPES.

NELSON RITTER.

"The fathers eat sour grapes, and the children's teeth are set on edge."

THE grape crop in Onondaga Co. is considerably below the average. Probably the yield is about three-fifths of what it was last year, when the crop was uncommonly large and fine. Notwithstanding the light crop, the price rules low: Concords are selling for from four to five cents per pound; Delaware and other fine varieties, for about two cents higher. The reason why grapes are selling at such low rates in our market is in a great measure owing to the fact that for several years grape-growers have been striving for an early grape, without much regard to quality. As a legitimate result, we have several varieties, the Champion (Talman) being the most conspicuous, that color early and can be sold sooner than better varieties, but which, when eaten, effectually cure the consumer of his appetite for grapes. This prevailing desire to sell "early grapes" causes many to sell all kinds in a half-ripe condition, thus destroying the present demand, instead of creating a greater one. Mr. A., in order to be the first in market and, perhaps, sell for a cent or two per pound higher than he could later on, picks his grapes while totally unfit to be eaten; Mr. B. thinks, that as Mr. A. is selling, he must not be behind, so he, too, commences to sell, and is followed by Mr. C., D., E, to the end of the alphabet.

Most of the retail dealers in our city are poor judges of fruits, knowing little about quality, and next to nothing about varieties. They know that there are black grapes, red grapes, and white grapes, but that is about as far as their knowledge extends. The consequence of all this is that our market is filled, early in the season, with green, trashy stuff, and the doctors reap the benefits, if any one does. I affirm that nine-tenths of the grapes sold in Syracuse are unfit to be fed to swine. This is a strong charge, but a true one, and is susceptible of proof. I hope it is otherwise in other localities. When well-ripened grapes are finally taken into market, the people are so completely *soured* that they can hardly be persuaded to purchase, even at low rates.

"What are you going to do about it?" some one may ask. Well, I will leave *my* grapes on the vines until they are *ripe*, and endeavor to persuade others to do so. Even the "Champion"—the poorest grape I ever tasted—can be eaten when fully ripe. People who sell unripe grapes, even at higher prices, are not gainers by the operation. Grapes increase in size and weight as well as in quality, when allowed to ripen, and these folks sell fewer pounds as well as lessen the demand, and lower prices. We must, as far as possible, sell directly to consumers, and furnish them such fine fruit that they will feel compelled to buy of us from year to year. Thus we can build up a trade on our "own hook," and be independent of this rush of green grapes and "green" grape-growers. One thing more: we must become disillusioned of the single idea that an "extra early grape" is so very important. Suppose we are obliged to wait ten days longer for a good grape to ripen, is not our patience rewarded?

The strongest argument in favor of early grapes is, that the later varieties are sometimes overtaken by frost. The Catawba and Isabella are the latest kinds I know; and yet, with me, the former has only failed to ripen two years in ten, and the latter only once in the same time. The Concord, Delaware, Salem, Diana, and others, have ripened every time, and are good when ripe. Who ever heard of an early grape or apple that was a good winter keeper?

Onondaga Co., N. Y.

THE GRAPES OF SOUTHEASTERN TEXAS.

G. MARTI.

MANY are the attempts that have been made in viticulture in this part of Texas. Hitherto, however, the results of these efforts have not been very encouraging, success being the exception rather than the rule. Why it should be so, puzzles many a one that beholds the luxuriance and sturdiness of the wild Grapes loaded annually with a profusion of fruit. But if we look at these indigenous species, we find their character quite different from that of those from which our cultivated varieties originally sprang. The climate of southeastern Texas is so much at variance with that of the northeastern States, where most of the native cultivated varieties originated, that it is not at all surprising to see these Grapes struggle and at last pine away, not being able to accommodate themselves to our extremely long summers and short winter rests. And not until we succeed in improving some of our indigenous species, will grape culture prosper in this part of Texas. We do not lack the material on which to work. There are four different

WILD SPECIES OF GRAPES

growing in this region, and several more may be found in the central and upper parts of the State. These four species are: the Mustang, the Chicken, the Post-oak and Muscadine Grapes.

THE MUSTANG GRAPE—Vitis mustangensis (Buckley)—is about the best known of these. It bears profusely; the bunches are of moderate size; but the berry is too thick-skinned, pulpy and excessively acid to give much promise of improvement.

THE CHICKEN GRAPE—not named—is to be found associated with the former in rich alluvial soils, differing from it by its still stronger growth, climbing the highest trees and bearing only at the extremities of its highest and most exposed branches. The bunches consist of very large, loose, shouldered and branched racemes. The berries are small, the size of a buckshot, of a fine spicy flavor, with just acid enough to make them agreeable. They are thin-skinned, and contain no pulp. If this species could be crossed with a view of enlarging its berries, even at the risk of losing some of the extra size of its bunches, the cross might prove a valuable Grape.

THE POST OAK GRAPE (V. æstivalis.)—in the interior of Texas this name is given to a different species (V. Lincecumii (Buckley)—abounds on upland soil. There is great variableness in this class. Some may be found quite sweet and luscious, while others are sour and austere. This is decidedly the Grape that gives the best promise of assuming the dignity of being the coming wine Grape. The only prosperous vineyards I know of in this vicinity are planted with its varieties; and this was not done until their owners, after trying pretty nearly all the sorts named in nurserymen's catalogues, came to the conviction that it was the only kind worth planting.

THE HERBEMONT, among others, belongs to this class. Its productiveness is simply marvelous; its quality, when well ripened, excelled by no other; it is hardy, healthy, strong and of a vigorous growth, accommodating itself almost to any sort of soil, situation and exposure. But still, it is, after all, not yet perfect, so that in it there is still room for improvement. It is the earliest to push in spring, and, on this account, it gets cut down by frosts. It is no showy grape; the bunches are greatly intermixed with imperfect berries; its ripening process goes on rather tardily and imperfectly, and on this account it gets greatly damaged by birds, which profit by the long interval from the time the first berry turns color, until the last one arrives at maturity. Its color is a dull, brownish purple, not at all showy.

NORTON'S VIRGINIA, Lenoir, Devereux, Cynthiana, and others belonging to the same class, generally do well; but none of these combines as many good qualities as the Herbemont.

THE MUSCADINE, Vitis vulpina, is a Grape quite dissimilar to any other. Like the Post-oak-grape, it abounds on high, light soils.

THE SCUPPERNONG is a sport from it, differing from it in nothing but the color, which, in the former is a dark purple. The merits of the Muscadine, and especially those of its offspring, the Scuppernong, have been from time to time greatly extolled. I never could see for what the latter deserves this praise. It is of a dwarfish, bushy growth, bears its large berries singly, or, under the most favorable circumstances, in bunches of two or three together, and drops them as soon as ripe. What is left of the berry, minus a thick skin and an indigestible pulp, has a peculiar aromatic and agreeable flavor. It has been suggested, time and time again, that this species should be crossed with another in order to produce a hybrid partaking somewhat of that flavor which is peculiar to the Scuppernong. Why such a hybrid is rather slow of making its appearance I can account for very well since I have, myself, been making

EXPERIMENTS WITH THE MUSCADINE GRAPE

without being able to boast of great results. Twice I tried to fertilize the V. vulpina with the pollen of the Louisiana Grape, which blooms about two or three weeks earlier; but, both of the attempts resulted in failure. Two years ago I tried the same experiment *vice versa*, making the Louisiana the seed-plant. I was able to obtain the pollen at the proper time by retarding the one vine and forcing the other. Every precaution was taken against any other but artificial impregnation. Out of 124 flowers on which I operated, I only obtained 35 of what I then thought perfect seeds. Of these, only 23 germinated. A regular mongrel lot these seedlings were. Some of them had only one seed-leaf, some had three of them; others had them twisted and contorted. Those that exhibited the greatest monstrosities died before they pushed the proper leaf. Some would grow a few inches, pine away and finally perish without any apparent cause. At present I am in possession of only eight of these plants; but three of them, despite the care given them, made a growth of only about three feet, while the others are stunted, dwarfish cripples. In my opinion, this species of grape—the V. Vulpina—is so very different from any other in its structure, that it will not even produce a vital hybrid. The pollen of it is a course yellow powder, while in the æstivalis sorts, it is a whitish, almost imperceptible dust. But, after all, I hope we will, ere long, find the grape for southern Texas—*qui vivra, verra!!*

Harris Co., Texas.

EXPERIENCE WITH GRAPES IN MICHIGAN.

S. B. PECK.

HAVING, during the past twenty-five years, raised a few of the common varieties of grapes, mainly for family use, and having for fifteen years past had abundant opportunities to examine those that come into this city for retail market as well as those raised in the gardens of this vicinity, I have been compelled to come to the following conclusions: first, that of the large amount of this fruit consumed, a very small percentage is used while in its best condition, as it is generally marketed and eaten before its saccharine elements are fully developed: second, that the summers north of about 41 degrees of latitude are too short for the full perfection of many of the popular varieties now under somewhat extensive cultivation within the limit mentioned: third, that there is no department of agriculture, horticulture or pomology so little understood as to its requirements of heat, the proper amount of moisture and the best modes of training and cultivating. The science of viticulture is yet in its infancy, so far as concerns the common run of people who essay to raise a few grapes for domestic use. True, we have many men who have devoted a vast amount of time, energy, research and experiment to the production of new varieties, both by cross fertilization and by evolution, but the duration and number of their experiments are small in comparison with the time and experiments devoted to other branches of horticulture. Having come to these conclusions I am, moreover, of opinion that

THE GRAPE WANTED

is one that will fill the following requirements: First, that in ordinary seasons and in ordinary exposures it shall attain its full color early in September; second, that it shall have sufficient tenacity to remain on the stems and bear handling for at least two weeks after fully coloring; third, that it shall have a thick, strong, broad leaf, of which that of the Concord is the most perfect type. As to its size and color, I consider them of minor importance to the connoisseur; and as to flavor, that is a mere matter of taste in which consumers do, and always will, differ. Productiveness and hardiness are certainly very desirable, especially when the dollars and cents to be obtained from them, are considered.

With these ideas firmly fixed in my mind, I obtained, in the spring of 1875, single plants of twenty-eight varieties that were then new to me, among which were twelve of Rogers' Hybrids. Of the twenty-eight, six failed, including four of the Rogers'. A majority of the twenty-two left fruited in 1877. In 1878 nearly all failed, owing to the frost in May. With this very limited experience I should gain little credit were I to be very positive in my conclusions. Of the

NEW VARIETIES TESTED,

THE REQUA—Rogers' 28—a rather large, brick-colored grape, ripening a little before the Delaware, has best met my approbation.

THE MASSASOIT—Rogers' 3—is very nearly the same thing in size, color and time of ripening, both being also very vigorous in foliage and wood.

THE LINDLEY—Rogers' 9—is nearly the same in color and time of ripening, but it is not as large in berry, leaf or wood.

These three of Rogers' reds all adhered well to the stems after being picked, Sept. 10, '77, and kept on racks till January and February and are all, to my taste, superior in flavor, and only lack the thick, rough leaf of the Concord to resist the attacks of insects.

THE SALEM—first called Rogers' 22, but now 53—I have fruited one vine of, a few years. In foliage, wood and color it is much like the above, but it is larger and later in fruit. It is a little risky as to fall frosts, but I am so pleased with its size and rich, raisin flavor as to put out fifty more. It ripens not much, if any, behind Concord. As to its hardiness, I cannot say much, having always laid all these down with a little brush over them, but I see no reason for thinking they are less hardy than the Concord, though I do not expect them ever to be as prolific.

MERRIMAC—Rogers' 19—black, is much like Salem in size, foliage and time of ripening.

WILDER and AMINIA—the former Rogers' 4, and the latter his 39—stand high in my estimation. Both are black, vigorous and promising in growth.

ROGERS' 1 and 2 I have, but I judge them too late for me.

EUMELAN, black and rather small, is sweet, rich and as early as any of the above, and so far I like it.

NORTH CAROLINA is the old Isabella in size, color, flavor, hardiness and productiveness, with an advance of ten to fifteen days in ripening. I like it so far.

THE SENECA and the KEUKA appear to be about a second edition of the Hartford or Ives'.

THE DRAGUT AMBER, Perkins and Northern Muscadine are described by Meade as "unmitigated fox from the woods." The two former are in my experimental list and are highly spoken of by some, and I think are early, hardy and fair. I might say ditto of the Belvidere; but my two Northern Muscadines are old offenders on my grounds and not worth their room.

The above is about all I have to say of the twenty-two tested varieties, by the way of description. As to flavor, I would give preference to the Salem and Merrimac. For cultivation for

my own family use, I would, from my present experience, prefer Requa and Massasoit, mainly because they are a few days earlier and more nearly answer my requirements.

Muskegon Co., Mich.

GRAPE LEAVES.—No. II.

W. C. BELLAMY.

GRAPES FOR ALABAMA.

THE CATAWBA, although made so famous by Longworth in wine and Longfellow in poetry, though a fine Grape, will *not*, as a general rule, succeed in the South. I know of no locality south of the Cumberland River and east of the Mississippi, where it attains even a moderate degree of perfection. So, in spite of Longworth's success and Longfellow's wine-inspired song, we of the South may as well dismiss all hope of it here.

THE SCUPPERNONG and its seedlings, as mentioned in "Grape Leaf," No. 1, are, *par excellence, the* Grapes for the South. By changing two words in the last stanza of Longfellow's poem, it would be strikingly applicable to this Grape—thus—

"And this song of the vine;
This greeting of mine,
The winds and the birds shall deliver
To the queen of the *South*,
In her garlands dressed out,
On the banks of the *Scuppernong* River."

THE CONCORD AND IVES, well known throughout the country, come next in fecundity and value both as wine and table Grapes. Both are very prolific with us—much alike—both possessing in a high degree that Labrusca or foxy flavor so peculiar to that species. The berry of the Ives is smaller than that of the Concord, but the vine is more prolific in bunches, so that the actual quantity of fruit from each is about equal. They are so nearly identical in flavor that the wine of one is undistinguishable from that of the other.

THE HERBEMONT MADEIRA—known also as the Devereux and Warren—should, perhaps, have come in before the two last mentioned, for it is perfectly hardy and prolific with us, subject to no disaster, yielding annually large crops, and making a wine not easily distinguishable from good Madeira. I had one vine of this variety, in Barbour County, in this State, from which I made ten gallons of wine, after having given away and used much of the fruit. It requires less pruning than the Ives or Concord, and delights in arbors more than in trellises.

THE MARTHA, a white seedling of the Concord, is a delicious Grape for table use, with a thin skin, tender pulp, and a delicate modification of the peculiar Labrusca flavor of its parent. But it is neither so hardy nor prolific as the Concord, and will hardly ever come into general use with us as a wine Grape.

THE IONA is in every respect one of the most delicious Grapes we ever get in the South. Being naturally of a tender and delicate constitution, it attains with us, in the open air, only a moderate degree of perfection.

THE DELAWARE—which might be aptly described as a miniature of the Iona—is prized with us hardly more for its excellent qualities than for its striking beauty. When well arranged in a fruit-basket, its rosy color, contrasting with the deep purple of the Concord and the rich, clear yellowish green of the Martha, produces an effect strikingly beautiful, while the berry is no less pleasing to the eye than grateful to the palate.

THE SALEM is also a fine table Grape, and, with reasonable care, attains a fair degree of perfection with us.

There are very few others that are *known* to suit this section except all the seedlings of the Scuppernong, of which there are many, both wild and cultivated. The most popular of them are: Thomas, Flowers, Tender Pulp, and perhaps others. All these, in strict obedience to what seems a universal law with this Grape, are black, the parent being white. Much is said in praise of them, but not having cultivated any of them except the Thomas, I cannot give any personal experience beyond the fact that they all are hardy and prolific south of the 37th degree of latitude, but not so north of it.

FOREIGN GRAPES are only raised in the United States at great expense in hot-houses, and hence it has long been a great desideratum among vine growers to acclimate them to our open air. The famous Black Hamburg, that flourishes so well in Europe, is one of the finest Grapes grown, but I cannot learn of any one in the United States who has ever grown it successfully out-of-doors. The causes to which its failure hitherto has been attributed, are innumerable. I have studied the matter closely, and experimented with the Grape for years, and am at last rewarded with success in finding both the difficulty and its remedy, and I have the Grape now acclimated and thriving to perfection in the open air. The process or means, however, by which I have accomplished it I prefer to keep to myself; for it appears to me legitimate that I should reap any reward there may be for the time, labor, and money I have spent in attaining so desirable a result. I can only say of it here that it is purple and has a flower similar to that of the imported Malaga. It is my intention to try my acclimating process with the Malaga also, and with the Tokay.

Calhoun Co., Ala.

THE PRENTISS GRAPE.

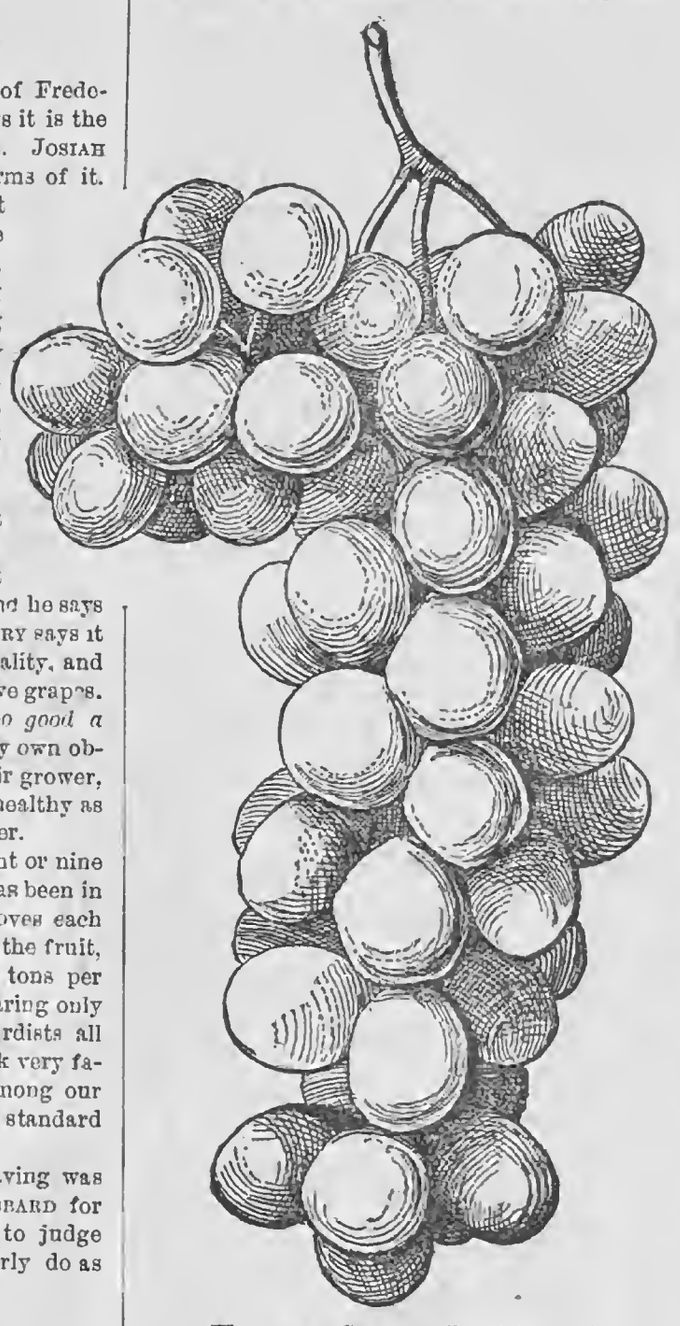
OF this grape, Mr. T. S. HUBBARD, of Fredonia, N. Y., writes us: "DOWNING says it is the best pure native grape he has eaten. JOSIAH HOOPES writes, speaking in high terms of it. Mr. OHMER, of Dayton, writes me it was seen and tested by a council of five good judges from Southern Ohio Fair, and each and all of them, including himself, pronounced it as promising to be the best of any of our American White Grapes. SAMUEL MILLER, the originator of the Martha, says it is the finest out-door, white grape that has come under his notice. D. BANDER, Secretary of Pleasant Valley Wine Co., says he showed it to several prominent grape growers at Hammondsport, and all with himself pronounce it the finest white grape they ever saw, and he says the foliage seems to be perfect. BARRY says it is a handsome white grape of fine quality, and will no doubt rank among the best native grapes. M. B BATEHAM thinks it of almost *too good a quality* to be healthy and reliable. My own observation of it is that it is hardy, a fair grower, not a rank grower, with foliage as healthy as that of the Catawba, and a heavy bearer.

Mr. PRENTISS originated it some eight or nine years ago. It is a seedling of Isabella, has been in bearing four or five years and improves each year. This year he has over a ton of the fruit, the vines bearing at the rate of three tons per acre while many other varieties are bearing only half a crop. The neighboring vineyardists all agree as to its good habits, and speak very favorably of it. I think it will rank among our best grapes and become a valuable standard variety." See illustration on 1st page.

[The bunch from which our engraving was made, was not sent to us by Mr. HUBBARD for that purpose, but merely to enable us to judge of its quality. This we could not fairly do as the grapes were not quite ripe.—EDS.]

THE SHELBURNE GRAPE.

THIS is a seedling of Allen's Hybrid, originated in 1869. It bore its first fruit—five clusters—in 1872, after the hard winter preceding, having been pruned the previous fall and left without protection. This was the third year from transplanting and the fourth from seed. It has been exhibited at the Franklin county Fair, Greenfield, every year since, and has repeatedly received premiums. So far the vine has proved perfectly hardy and healthy. The grape crop hereabouts has proved almost an entire failure this year on account of too much rain in August, when we had fifteen days of it; but the vines and fruit of the Shelburne have been uninjured. Indeed, it has done better than any of the old or new varieties. The fruit was fit to eat by the first week in September. I have crossed almost all the best varieties and have been raising seed-

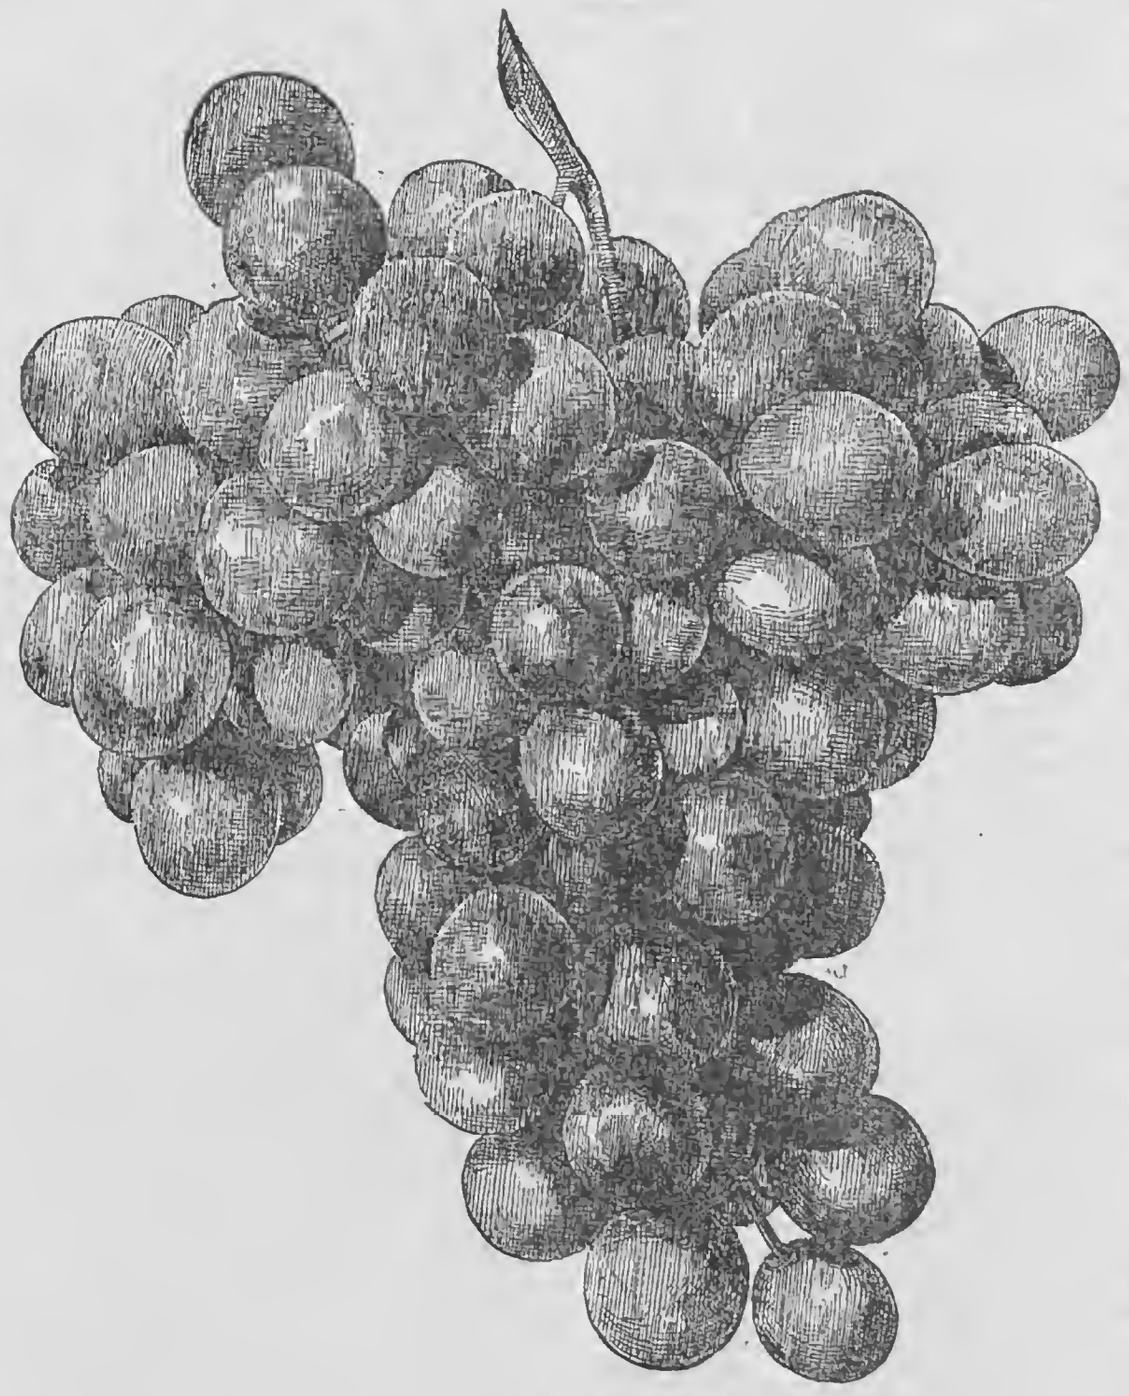


WAVERLEY GRAPE —(See 1st page.)

lings for the last fifteen years, and in my experience Hybrid-self-seedlings, expecially those of the Allen's Hybrid, are the most productive of the improved hardy varieties, in spite of all theories to the contrary advanced by others. I calculate on the principle of reversion. The Shelburne is a case in point: the vine closely resembles its grandmother while the fruit is like that of its grandfather. I have two more like Shelburne, of the same age, perfectly hardy and healthy, but ripening too late here. I have no vines for sale, because, having other business to attend to, I have no time to raise plants.

Franklin Co., Mass. JACOB STEIGLEDER.

[THIS seems a valuable variety. The grapes are white, and so nearly transparent that, when held up to the light, the form of the seeds can be seen. They are of medium size, thin-skinned, tender flesh, small-seeded and the flavor is sweet though sprightly and agreeable. The bunches are compact and the berries cling to the stems firmly.—EDS.] See illustration, p. 681.



CONCORD NO. 1.—(See 1st page.)

GRAPES IN WESTERN NEW YORK.

W. J FOWLER.

THE grape crop through this section will be everywhere much lighter than usual. The May frosts cut the tender shoots; and probably not one-quarter of the buds which would have fruited came into blossom. The result is that vines have made an immense growth wherever left unchecked, and even where the buds have been pinched back, the foliage and fruit have been healthy. Varieties usually subject to mildew, as Adirondac, are this year exempt. This indicates pretty strongly that overbearing is the cause of much of the mildew and other diseases so often complained of.

Grapes ripened this year earlier than usual. We have had a warm summer; but, in part, this early ripening is due to the light crop. I learned, years ago, that remorselessly thinning Catawba Grapes will make even this late variety perfect some fruit in ordinary seasons. Where two, three or four buds for blossoming start, pinch off all but one or, at most, two. Then, as the grapes attain some size, say by the middle of July, pinch the ends of the shoots and turn the strength of the vine to the production of fruit. In this way we may make two bunches weigh as much as three, and ripen a week or ten days earlier. The thinning by the frost was of a different kind. Not merely the bunches, but the shoots themselves were destroyed. The shoots which escaped did so entire. Generally the part of the vine on the top trellis escaped, and here is usually where the finest bunches are found

The season has been so extraordinary that little is learned about the new varieties. Almost any grape will ripen this year, and if it will not, it should be at once discarded. The Hartford was fair eating by the 28th of August, and the Champion was colored several days earlier. By the second week in September all the Rogers' grapes here were ripe, and so were the Delawares, Concords and Adirondacs. The Isabella was rapidly turning, while the Iona and Diana were translucent, but improved a good deal afterwards. The Brighton, a new grape, I have not seen this year. My one vine does not bear yet, but I hear very favorable reports from this variety wherever the frost did not destroy it. The Brighton ripens as early as the Hartford, and may be safely set down as the best very early Grape.

Farmers' vineyards have been more neglected this year than usual; but I think that the severe pruning last spring caused them to make enough good wood this summer for another year. That the vines are generally healthy is a strong point for the future. What grape culture needs is a yearly thinning of the fruit on some better plan than indiscriminate cutting by the frost. When vines get this, half the diseases which now destroy them will be removed. Even the phylloxera will not do so much damage except on vines enfeebled by overbearing

Monroe Co, N. Y.

GRAPE ITEMS.

KEEP Grapes in a dry, cold room.

VINES ought to be planted at *least* eight feet apart.

RICH SOIL is now generally considered better than heavy manuring for the hardy Grape.

IN transplanting dig large holes, spread out the roots carefully and cover with fine earth.

AMONG THE NEWER VARIETIES, we have yet to learn of any that will keep better than Isabella, Diana or Rebecca.

Mr. O B. Galusha says that it has been observed that Grapes grown upon sandy loam are sweeter than those grown upon clay loam. He has tested this for the past six or eight years and found it invariably true.

R. W. Hunt, of Galesburg, Ill., in the Trans. of the I. S. H. S., says: "the best evidence I can offer in behalf of the Concord will be found in the markets. I think you will there find twenty bushels of them to one of any or all other kinds during the Concord season."

BAD ADVICE —We find in the agricultural columns of the Weekly Herald the following: "Vines drenched every week with soap-suds flourish admirably and extend themselves so as to cover large buildings, every branch bearing fruit." How much fruit and of what quality?

GRAPE ROT —George W. Campbell says that he has never known the Delaware affected with the rot, even in the most unfavorable years. For many years the Concord was exempt; lately it is more or less affected in unfavorable seasons. Sulphur is recommended as one of the best preventives of the rot, to be applied in good season.

THE Southern Fox or Muscadine Grape is botanically Vitis vulpina, the original of the

Scuppernong;—the Winter or Frost Grape is V. cordifolia;—the Northern Fox Grape is V. Labrusca, the parent of the Concord, Catawba, etc.;—the Summer Grape is V. æstivalis. The thousands of varieties of Grapes cultivated in Europe are thought to have originated from Vitis vinifera.

GRAPE SELECTION.—The editor of the Germantown Telegraph recommends, 1. Telegraph; 2. Concord; 3. Hartford; 4. Clinton; 5. Salem; 6. Creveling. He says: "Salem has proved with us to be excellent—we think it the best out-door Grape, it having but little pulp; Rogers' 21 also bears abundantly, and will become popular. No. 32 is a beautiful pink Grape, almost transparent, an abundant bearer and very good in quality. There are new varieties "in the market," but we advise our friends to keep them at a distance for the present. Clinton, in the foregoing list, is only for wine, and is probably the very best for that purpose in this section."

"STAR" GRAPES.—In the transactions of the Am. Pom. Soc'y there are few varieties of Grapes that receive double stars. Agawam (Rogers' No. 15) is double starred by Maine, Wis., W. Va. and Ky. Catawba by Ohio, Tenn. Concord by N. H., Mass., Conn., N. Y., Mich., Wis., Oregon, Penn., N. J., Md., O., W. Va., Ky., Tenn., Ills., Iowa, Mo., Neb., Kas., S. C., Ala., Fla. Creveling by Oregon and Florida. Delaware by Me., N. H., Mass., Conn., N. Y., Mich., Wis., Md., Va., O., W. Va., Ky., Tenn., Ills., Iowa, Mo., Neb., Kas., S. C., Ala., Fla. Hartford Prolific by N. H., Vt., R. I., Conn., N. Y., Mich, Wis., Md., Va., O., W. Va., Tenn., Iowa, Neb., Ga. and Fla. Ives by Ky., Tenn., Ills., Iowa, S. C., Ga. and Ala. Massasoit (Rogers' No. 3) by Pa. Martha by Fla. Maxatawney by Tenn., S. C., Ga. Norton's Virginia by Va., O., W. Va., Ky., Mo. Salem by Maine and W. Va. Scuppernong by S. C., Ga., Ala., Fla. Wilder (Rogers' No. 4) by Me., N. Y., Wis., W. Va.

Horticultural.

A VERMONT "FRUIT JUBILEE."

T. H. HOSKINS, M. D.

LAST week, in acceptance of an invitation from the Secretary of our Board of Agriculture, I attended the fruit fair in Grand Isle. Perhaps many of the readers of the RURAL do not know where "Grand Isle" is, or which Grand Isle is meant, since there are several of them. It is not the Grand Isle of Niagara River, into which Major Noah proposed to gather the Jews so long ago, but the Grand Isle of Lake Champlain, an island some ten miles long and four wide, divided into two towns, South Hero and Grand Isle, and constituting with neighboring smaller islands, the fruit garden of Vermont, where, in 45° north latitude, the Pear and the Grape, and all the tender Apples thrive as well as about New York, while on the same line east or west of the lake, after leaving the immediate shore, only the hardiest Apples can be grown, and even the hardiest Pears are counted an impossibility.

The people of Grand Isle are well-to-do, slow and easy, extremely hospitable, generally well educated and fond of reading, but, like most people whose lines have fallen in pleasant places, they have not had the reputation of being very progressive. Only recently have they thought of exhibiting their products, as the farmers of the mainland are wont to do, in fairs or expositions. But the idea being once started, three or four years since, such success has attended the project as to fairly surprise those who took part regarding the magnitude of their resources. I feel sure that besides the immediate pleasure of such gatherings, the information gained and the neighborly feeling fostered, that a direct profit will be realized by the diffusion given to the knowledge of the great quantities of fruit now grown, and the vastly greater quantities that might be grown upon this and the neighboring islands, and that we shall not long hear of the bushels of luscious pears and glorious apples rotting down for lack of buyers, while half the people of Vermont do not see a pear from one year's end to another's, and many are deprived of a sufficiency of apples for home consumption.

Lake Champlain lies in the low valley that is practically an extension of that of the lower Hudson, northward to Montreal. The surface of the lake is less than 100 feet above the sea. It is frozen but few months in winter, even the coldest. Last winter it was not passable by teams at all. The effect of this lowness of level and openness to the south winds, together with the protection afforded by the waters of the lake, gives to Grand Isle its exceptional climate, and, with its rich limestone soil, insures its superiority as a fruit-growing region over all the territory surrounding it.

The meeting referred to was held in the neighboring churches of the Methodists and Congregationalists; the former being occupied, both below and above, with pomological and floral exhibits, while the latter was used for the meetings held under the auspices of the State Board of Agriculture. Three days were thus spent in practical addresses and discussions, as well as in the inspection of fruits, the comparison of varieties and the rectification of names. The attendance was large, being gathered not only from the islands, but from the mainland; though the number of visitors from the latter was greatly lessened by the high winds that prevailed, arresting travel by water, and preventing the expected visit of Mr. P. Barry, of Rochester, whose presence and address were warmly looked for. In a previous year, friend John J. Thomas received a hearty welcome at one of these meetings, and all the leading pomologists and florists are so well-known there, and so highly respected, that their visits will always be an ovation.

As the varieties of fruit grown upon Grand Isle are substantially the same as those of central New York and the Hudson Valley, I can offer you nothing of novelty in describing them. But for size, perfection and beauty of color, the fruits of Grand Isle seem to fully equal the fruit of the Centennial or of the shows of the American Pomological Society. I advise all interested in fruit-growing, and those who seek recreation during the summer and fall months, that Lake Champlain and its island afford them a field well worthy of exploration and study.

NOTES FROM THE RURAL GROUNDS.

EXPERIMENTS FROM WHICH NOTHING CAN BE LEARNT. NO. I.

UPON a little hilly part of these grounds, which has not, that we can learn, been cultivated in fifty years, we dug six holes one foot square, pulverizing the earth and leveling the surface as if it were a flower-pot. On the 18th April we planted three kernels of corn, top-dressing each square with different fertilizers as will be seen in the following table which also shows the weight of the corn and of the leaves and stalks produced:

Plot I.	Nitrate of soda.	Corn....	2	oz.
		Stalks and leaves	2	"
" II.	Dissolved Bone-black,	Corn....	3	"
		Stalks and leaves	5	"
" III.	Muriate of Potash	Corn... 1 lb.	2	"
		Stalks and leaves 1 "	12	"
" IIIa.	Sulphate of Potash	None		
" IV.	Nitrate of Soda Dis. Bone-black	Corn....	3	"
		Stalks and leaves	2	"
" V.	Dis. Bone-black Muriate of Potash	Corn....	12	"
		Stalks and leaves 1 lb.	0	"
" VI.	Nitrate of Soda Dis. Bone-black Muriate of Potash	Corn....	12	"
		Fodder. 1 lb.	0	"
" VII.	No manure.	Corn....	2	"
		Stalks and leaves	4	"

We are not aware that anything can be learnt from the above or similar experiments conducted in so small a way.

NO. II.

On June 2. we washed ten flower pots (four-inch) thoroughly and filled them with clean coarse sand. In these (half an inch deep) were planted Radish seeds. Each pot was manured differently and the sand kept constantly wet. All of them were well drained.

Pot. 1.	Nitrate Soda; would not germinate. Three seeds were tried.		
" 2.	Nitrate of Potash. Roots, tops and radish weighed when taken out of the sand	1 oz.	8 dr.
" 3.	Dis. Bone-black, weight	1 "	12 "
" 4.	Bone (flour)	1 "	8 "
" 5.	Sulphate of Potash. Did not germinate. Three seeds sown.		
" 6.	Nitrate of Soda. Dis. Bone-black	2 "	4 "
" 7.	Dis. Bone-black. Muriate of Potash.	1 "	5 "
" 8.	Dis. Bone-black. Muriate of Potash. Nitrate of Soda	1 "	4 "
" 9.	Bone (flour). Sul. Potash. Nitrate of Soda. Dis. Bone-black. Muriate of Potash	0 "	7 "
" 0.	Water only	0 "	12 "

The following is the composition of the ash of the cultivated Radish:

	Root.	Leaves.
Potash	21.98	5.05
Soda	3.75	15.60
Lime	8.75	27 09
Magnesia	3.53	7.08
Iron	1.16	8.72
Phosphoric acid	41.12	13.08
Sulphuric acid	7.71	9.64
Silica	8.17	8.22
Chlorine	4.09	5.16

It will be seen that the proportion of phosphoric acid is very large, as compared with other roots.

From the composition of the ash we should have looked for the largest plants and roots in No. 8 or 9, rather than in No. 6, 3 or 4.

If from this experiment we learn anything, it is that the Radish will do well enough in any soil provided it be light and kept well watered.

GOOSEBERRIES IN CALIFORNIA.

THE Gooseberry, although a favorite fruit with Californians, is cultivated less and less extensively every season, on account of its falling a prey to its deadly enemy—mildew. The plants require a peculiar soil, climate and cultivation to grow successfully and free from this pest. When well cared for, however, or when planted in a locality where they grow well, there is no more profitable or certain crop. The Downing and Houghton Seedling are the only varieties worthy of culture, being profitable, a sure crop, and in every way superior. Several English varieties have been tried here, but have given very little or no satisfaction. W. C. L. DREW.

El Dorado Co., Cal.

THE WILD-GOOSE PLUM.

SEVERAL years ago an article appeared in the RURAL, describing in favorable terms the Wild-Goose Plum. I invested in that kind of plum tree to the extent of $90, and looking for fruit on it has been a wild-goose chase ever since; and now I am convinced that it has no connection with the goose that laid the golden eggs. Last year, I got from it ten plums and, although they were nice, nine dollars apiece was rather a steep price to pay for them. E. B.

Middletown, N. Y.

Arboricultural.

TREE PLANTING.

"ALL the world and his wife" should plant vines, shrubs, ornamental, shade, and fruit-bearing trees, for comfort, for profit, for health, and in the interest of good morals. Every one loves fruit, yet how comparatively few grow it. As the season for planting is upon us, and that very many be encouraged to set out trees, &c. I propose briefly to describe the best method of tree-planting, so that all may live and thrive.

After staking off the ground, dig the holes at least 30 inches square, and 20 inches in depth, throwing the top soil in a pile, scattering the sub-soil, and making the bottom mellow with the pick. Fill to the depth of 12 inches with inverted sods, well rotted manure (old), or weeds, and tread them down well. Next, of the top-soil make a mound whose top shall be an inch below the surface and six inches at the sides. On the center of this hillock place the tree, the roots of which should radiate in an easy and natural manner down the sides of the mound. Hold the tree in its place, working well round the roots the earth which an assistant is shaking from his spade. After the hole is filled, press the earth round the tree with the feet, and finish by throwing over the spot some loose soil. It is well, too, to mulch young trees; which can be done with almost anything. If you have plenty of stones, pile them round the trees. They will keep the stems erect, and the ground moist and soft.

Set peach trees that are one year old; trim them up to a "bare pole," and cut them back to two feet from the ground, so that the trees may branch low. Set other trees when two years old, trimming off the branches. It is desirable to have the trees straight in the rows. This can be effected, very nicely, by using the old-fashioned "tree planter," which any person can make as follows: take a board, say five feet long and six inches wide; saw a notch on one side, midway between the two ends, and near each end bore a hole with an auger. Now, before you remove the stake where the tree is to stand, preparatory to digging the hole, bring this notch to it, at the same time thrusting down two stakes, one at each end; remove the planter, letting these end stakes remain. When ready to set the tree, replace the planter in the same position as at first; place the tree in the notch, and proceed.

In closing, I may remark that the four reasons I have mentioned above for tree-planting must commend themselves to every reader. Good fruit commends itself. Eat freely of it, you will be healthy and can "throw physic to the dogs." Raise it and it will pay you from 100 to 500 per cent profit. Grow it that your children may have their fill, and not be tempted to steal from the neighbors. The poet saith, "A thing of beauty is a joy forever." And certainly vigorous and fruitful trees are a joy and a benefaction! G. F. NEEDHAM.

District of Columbia.

LARGE LEAF OF TULIP TREE.—Mr. E. V. Teas, of Dunreith, Ind., knowing that the RURAL is an admirer of the handsomest of lawn trees, the Liriodendron tulipifera, sends us the measurement of a leaf he lately plucked from a fine specimen. The dimensions were: width, 16¼ inches; length, 17¼ inches, including 3¾ inches of stem.

Floricultural.

BULBS AND PLANTING THEM.

WM. FALCONER.

I CAN give no new information on this subject. This is planting time, however, and the sooner the bulbs are put in the ground the better for themselves. We had a glorious and varied display last spring, and are planting many more genera, species and varieties this fall. As different diseases require different cures, so different circumstances require different practice; therefore, I will relate last spring's lessons, and leave the rest to yourselves.

CROCUSES bloomed early and copiously when planted at the base of the south-front walls, and most charmingly when studded all over sunny banks, on grass lawns, and under trees. As borders to beds, too, we used them, planting them deeply, so that we might plant a row of summer-flowering plants over them without hurting them. Some that were in the way, we lifted, transplanted for the summer months in an out-of-the-way place, and now we replant them (fine bulbs, too,) in their former place. Some tufts of Crocuses were grown in the rockeries and, in common with other inmates, had a winter mulching. They came up weaker and less satisfactory than those that were not mulched at all, and where the leaves got a little bleached by the mulching, they were visibly injured. Crocuses planted among bushes, in shady places where the frost was firm till the end of March, did not begin to blossom till those on sunny banks had about finished. When grass-mowing begins, no respect is paid to crocus leaves, but the roots don't seem to take it badly, but come up next year as bright as ever. Plant Crocuses two inches deep, is often advised; I say four to six inches. In shallow planting, frost throws them out of the ground, summer sun parches them, and fall rains prematurely start them, and thus lay them liable to injury from keen frosts.

SNOWDROPS behaved, in every particular, as Crocuses did. But instead of planting them so scatteringly as Crocuses, I would advise to plant them in little clumps, and keep them more about the borders, rockeries, shrubberies, or half-wild places. There is a pretty double-flowering kind, also the Crimean Snowdrop, which is larger than the common one.

WINTER ACONITE (Eranthis hyemalis), a little yellow flower of the crowfoot family, loves a nook about the front of a shrubbery, where it will remain undisturbed year after year.

ERYTHRONIUMS, too, both American and European kinds, delight in a similar place, and good soil, with lots of leaf mold in it.

The European Dog-tooth Violet's roots, imported like other bulbs in a dry state, Mr. Woolson, of Passaic, N. J., told me did not bloom with him; now, our experience is quite the contrary. We imported some roots from Holland last fall; they were done up in paper bags like Crocuses, Hyacinths, or Daffodils, and they bloomed out splendidly the succeeding spring.

JONQUILS, DAFFODILS, and most kinds of Narcissus we find quite hardy and satisfactory, providing we can stay them from growing prematurely in the fall; but, in fact, the commoner kinds will take care of themselves. Plant six to eight inches deep, several in a clump, in places where they are not likely to be disturbed; and, as the clumps get crowded in after years, lift, make three or four clumps out of one, and replant.

FRITILLARIAS there are many kinds of, notably different varieties of Crown Imperial and Guinea-hen Flowers, which may be planted, two or three roots together, in the borders. And there are some recently introduced beauties of the same genus, as F. pudica from Utah. It is a tiny fellow, with nodding golden blossoms; hardy as a Crocus, multiplies freely from bulblets and seeds, and blooms contemporaneously with Snowdrops.

SQUILLS there are various kinds of, particularly Scilla Sibirica, amæna, and bicolor, whose blue flowers are very pretty. They bloom a few weeks later than Snowdrops, and require the same treatment.

IRISES, Persian, Spanish, and other bulbous sorts, should now be planted. Put a piece of board or mulching over them, but take care in spring, as their leaves show up early and may be damaged by bleaching.

HYACINTHS bloom in April and May, and are better suited for annual than permanent planting. They and Tulips, which bloom a little later, should occupy the conspicuous flower beds. About the middle of May, when they are done blooming, they may be lifted to make room for summer stuff, and planted in some out-of-the-way place till next fall. Grape Hyacinths (Muscari) are lovely things, with small heads of blue flowers. They should be planted like Snowdrops.

In the case of permanently planted bulbs, shallow planting I have found to be a great error. I know an instance in Massachusetts where, in '76–'77 Crocuses were planted two inches deep, as per directions, and, in the spring, the bulbs might be raked off the ground like horse-chestnuts or beech nuts in fall. And where Crocuses, Snowdrops, and Daffodils are naturalized about pleasure grounds, as is the case in many old European gardens, I have dug them four to twelve inches deep. Bulbs so very near the surface of the ground, cannot make fine bulbs for next year's use, neither will they multiply so fast; on the contrary, they degenerate.

Botanic Gardens Cambridge, Mass.

HARDY BULBS.

SNOWDROP is the first of hardy bulbs to blossom in the spring. The double ones are much the best. They should be set in clumps of a dozen or so, an inch apart and two inches deep. They are perfectly hardy, take up but little room and bloom before the snow is gone.

THE CROCUS is not far behind the Snowdrop in blossoming. I have had both in blossom with a large snow drift not two feet from them. The Crocus is more showy, however; the flowers are larger and are of different colors—white, blue, striped and yellow.

THE HYACINTH comes next. We can hardly do without a few of them, for fragrance. The bulbs are larger and need setting at least four

nches deep, and they do better if set as early as September, or early in October.

THE TULIP begins to bloom before the Hyacinth is gone, and what can be more gay than a bed or border of them! Some are quite fragrant and all are showy. They are the easiest for beginners to cultivate, requiring only any good common soil to grow to perfection. It is best to take them up every third year as soon as the leaves are dry, then set out again in October.

THE NARCISSUS in several varieties also delights us. Some are as early as the Hyacinth others later than the Tulip.

THE LILIES, the beautiful Lilies, that Solomon in all his glory could not equal in raiment, gladden our eyes after these. What can compare with the purity of the Lilium candidum and longiflorum, the gorgeousness of the Auratum or the richness of the Lancifolium, all sparkling like gems and all spreading abroad a delicious fragrance.

These have all proved perfectly hardy with me and are easy of cultivation, as they only need to be let alone to blossom freely. There are several other varieties, that are frequently cultivated and some of our native ones are well worth a place with the rest. My advice to every one that has never tried bulbs, is not to let this October pass without getting a few, and while they are getting some for next spring, save a few Crocuses, Hyacinths and Duc-Van-Tholl Tulips for the house next winter. My method of growing them for the house, is to take moss from the woods, fill whatever I use to grow them in, nearly full; then set the bulbs on top, put a thin layer of moss over all, keep just a little moist, then put in the cellar for a few weeks, and afterwards bring them up into my sitting-room where they are placed in the sunshine, and in a short time they delight all in the room with their fragrance and beauty.

Cortland, N. Y. MRS. H. W. B.

Miscellaneous.

HAND LABOR AND MACHINERY.

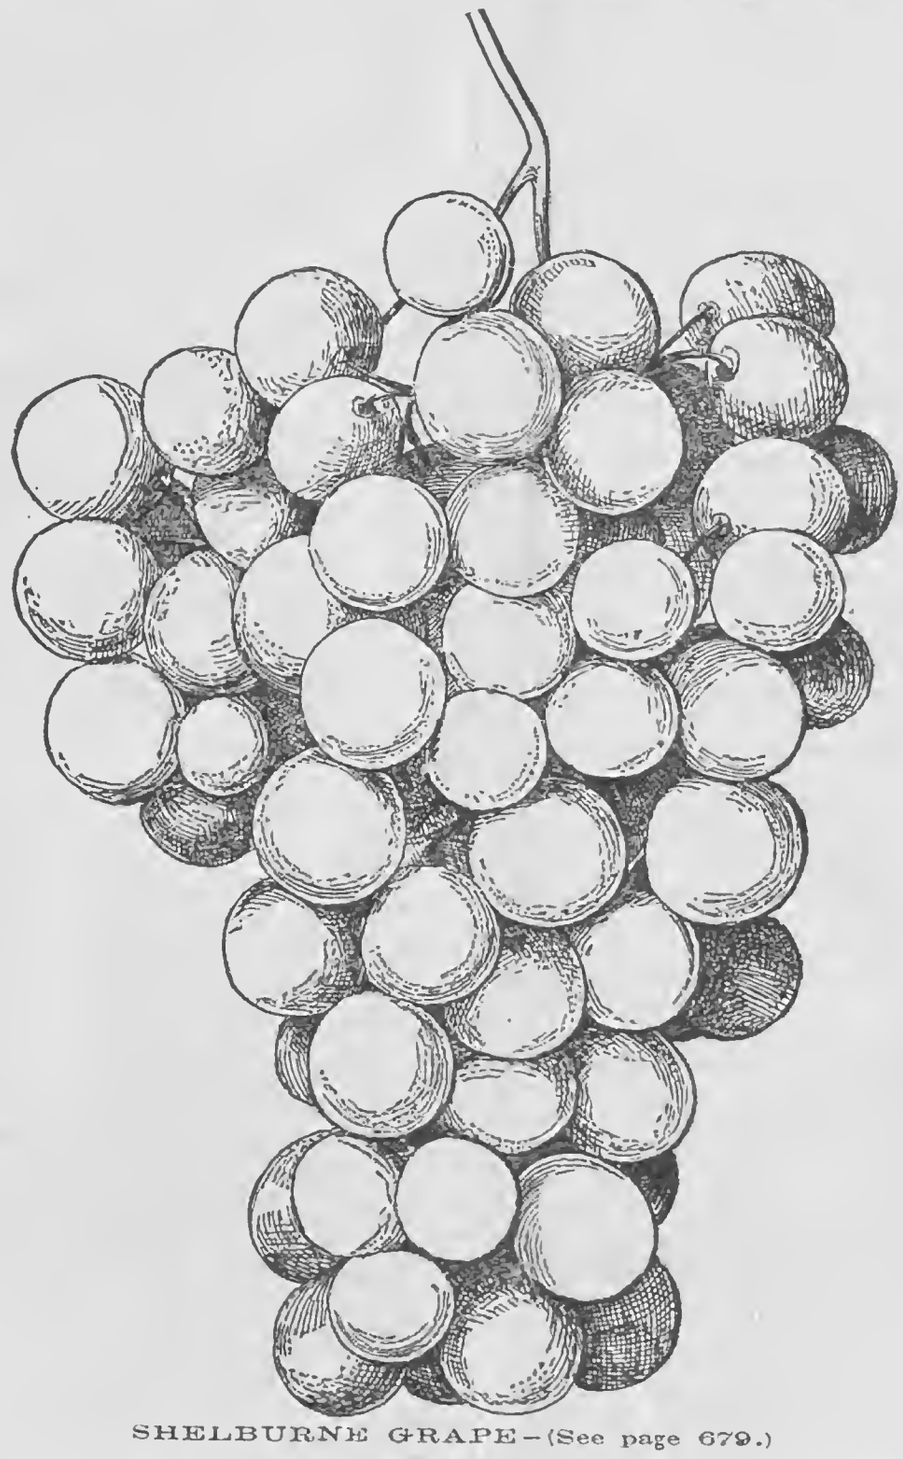
IT is a somewhat popular idea amongst what may, perhaps, well be called the "dissatisfied class" of laborers, as well as amongst some people supposed to be intelligent, that much of the present trouble is caused by the extensive use of machinery. Recently there have been riotous demonstrations against agricultural machinery, especially against harvesters and self-binders. The idea is, that for every machine an equivalent number of laborers are displaced, and reduced to enforced idleness. It is a very plausible idea, but to show its utter untruth is far from difficult. The facts which exist everywhere prove its falsity. Without entering into any argument or discussion, we may just now refer to a few pertinent facts which are so plain, apparent, and widely known, that nobody can deny them.

It is well known that there is more machinery used in every department of labor or industry in the United States than in any other country. People even go up stairs by machinery (elevators), barbers brush their customers' hair by machinery; there are type-writers to save labor in copying, as well as all sorts of labor-saving machinery; and from these light labors up to the heavy work of hoisting ships' sails and anchors, puddling iron, drilling rocks, and mining, human labor is displaced by machines. For human labor, everywhere it is possible, we use horse-labor; and horses, in their turn, are pushed aside by steam. Indeed, steam itself is probably on the eve of displacement by some cheaper and more effective power, and, if ever this happens, we may be sure it will begin in this country. At the same time there is no other country in the world where wages and, in fact, the rewards for all sorts of labor, are higher than here; nor is there any place in the world where there exists more comfort and ease in the circumstances of the people.

Now, let us look at the reverse of this. In China, everything is done by manual labor. Horse labor even is unknown. Men carry the chests of tea from the interior to the sea-board, over mountains and valleys, for hundreds of miles, frequently occupying three months in a journey, the chests being balanced in pairs upon the ends of long poles, which are supported upon men's shoulders, in the way so commonly figured in Chinese drawings and upon the old-fashioned "delf" ware. Passengers are carried in carriages slung upon poles, in a similar fashion. Men pull the boats upon the rivers or pole them along slowly and laboriously. In short, machinery of any kind is unknown, and its use forbidden, lest it might displace manual labor. In fact, an experimental railroad was recently torn up and destroyed as soon as it was built, for this reason. There a man employs a hundred days in a work which we would finish in a few hours in a lathe. There a man supports himself and family for a month in comfort for two dollars, and labor is worth from three to seven cents a day.

Let us take an intermediate example. In England most of the agricultural labor is done by hand. The traveler will see men, women and children at work in the fields weeding, hoeing, planting, sowing, reaping, mowing, raking hay, and doing all those things which we do here by machinery, by hand labor for a wage of two and a half to three dollars a week for man; a dollar a week for women; and twenty-five cents for boys and girls. A few years ago a mowing-machine could not be seen in England, and even now reapers are rarely seen; in fact, many farmers dare not use them lest their barns and stacks might be burned by enraged and jealous laborers. Men laborers were thought well paid at less than two dollars a week, and it is only since machines have come into use that farm wages and the value of horses have risen to nearly double former rates. Do not these facts proclaim a truth so plain that any man can understand it who is not blinded by ignorance or prejudice?

Facts are stubborn things; and these are too stubborn to be twisted or turned in any way from the purport which they should carry to a mind gifted with the most ordinary measure of intelligence. It may seem to be strange that this should be thus, but it seems equally strange to one ignorant of the facts, that the sun is stationary and does not rotate around us; and yet we all believe it, because of the evidences of it which appeal to reason and contradict our very sight.



SHELBURNE GRAPE—(See page 679.)

WHAT OTHERS SAY.

THE GREAT HOLKER SALE.—Females not bulls realized the highest sums at the Holker sale last week. This, however, does not alter the argument in the slightest degree. Mr. McIntosh gave two thousand six hundred and sixty guineas for Baroness Oxford 5th, because he has a manufactory of his own for this bonnie blue blood, at Havering Park. The Holker income will cause a more magnificent Havering outcome by and by, and in purchasing this female, Mr. McIntosh recovered his old sort, as he bred her celebrated grand-dam. For the same reason Mr. McCulloch gave 2,100 guineas for Grand Duchess of Oxford 22d. By mating her with an Oxford or Duke sire, he hopes to found a manufactory in Victoria of high-class pedigree cattle, and the rule of like producing like he no doubt desires to see verified in a pecuniary sense as well, by magnificent sums somewhat corresponding to the original outlay being realized by his own stock hereafter. He is seeking in England to collect the very *creme de la creme* of our herds, that he may have the very choicest material to offer to his brother colonists in a market admitting of great expansion.—*London Chamber of Agriculture.*

SUGAR BEET.—At the Farmers' Convention, as reported for the Maine Farmer, Mr. Genuert claimed that the culture of the sugar beet was needed by the farmers of a new section to subdue the land and to give a crop from which cash could be obtained; while it was equally as valuable to old sections, as a means of renovation, in connection with cattle husbandry. Beet culture and the raising of cattle are the accompaniments of high farming everywhere, and Belgium, which is the best-farmed section of the world, contains the largest number of cattle per acre. A crop of sugar beets he believed to be the basis of good farming, for the tops were as good as a crop of hay, the pulp was returned to the land through the cattle, while sugar was as good a market commodity as gold, the world over. The culture of beets means high farming, good manuring, and clean fields. Inferior cultivation is the great cause of non-success with the beet crop, generally—hence to succeed with beets, deep culture should be practiced, and this will lead to better culture for all crops the farmer grows. Intensive culture from which comes profit is not obtained without deep pulverization of the soil. No country in the world has ever "gone back" on sugar beet culture when once it has become well established as a leading branch of farming.

PROFESSORS GRAY AND DANA.—These two distinguished men, remarks the Boston Journal of Chemistry, are now in the evening of life, but still hard at work. Every hour of every day finds them either in their cabinets among their rare collections of specimens, in the field, or at their desks; but we can only hope that life and strength may be spared to them for many years, that they may make further and even richer contributions to human knowledge. Great learning and exhaustive intellectual labor, as far as our observation extends, do not produce unsocial habits of life, or pride of position, or arrogance; on the contrary, the truly great man, in science or literature, is in a marked degree genial and condescending. The men under consideration are in social life, simple, modest, kind, generous approachable. Such noble natures have no place for the pedantries and follies which environ little minds, when fortuitous circumstances bring them into notice. The earnest seeker after knowledge, however humble or untaught, never meets with rude rebuffs from the truly learned; they are the helpers and patrons of the lowly, if capable and honest.

JUDICIOUS PAIRING AMONG HUMAN ANIMALS.—The London Times says: Achievement breeds achievement. If improvement by the continual selection of the strongest and the best, is good for animals, it must be for the noblest of them. To a great extent the law is recognized; for, as a rule, aristocracy intermarries with aristocracy. In all ranks, health, strength, vigor of character, equitability of temper, and vivacity of manners constitute grounds for preference. The well-bred, the agreeable, the practical, the sympathetic—in a word, all who show the true type of manhood, or of womanhood, as contrasted with abortive, affected, or artificial developments—carry the day in the matrimonial race. Though with money and rank, the less perfect form goes to the wall.

Nevertheless, there is such an amount of intermixture with inferior qualities, that one may sometimes contemplate with dismay the possible degeneracy of great historical families, famous in the Legislature, the Cabinet, or the field. Indeed, as a lamentable fact, the taint of some lower nature does occasionally reveal itself in families with any number of noble and royal alliances. The great lords of creation will go on marrying whom they please.

But how about the majority of the great human herd that work with the hand, that minister to our wants, that till or defend the soil? Will it ever be possible to carry out in this sphere the principle now established and bearing excellent fruit at Holker? Will a crowded amphitheatre of lords and ladies ever see paraded before their admiring eyes the splendid results of careful selection and judicious pairing in the human species? It is to be feared the elements of the question are too complicated for that. They are moral as well as physical; and though these have much to do with one another, it is the moral element that most eludes scrutiny and defies assortment. Nevertheless, there is much to be learnt in the school of nature, for even the old heathen poet could observe that eagles will not produce doves, and that as there are breeds of horses, so there are of men.

FEEDING INDIAN MEAL TO STOCK.—The Mass. Ploughman says:

1st. Never feed it to a calf after it is three months old, but feed more for growth than for fat.

2d. Heifers intended for the dairy should not have meal until after their second calf, and not then until the calf is at least ten days old, and in small quantities at first.

3d. The injudicious feeding of meal is one of the reasons why farming does not pay.

4th. All grain fed to farm stock should be raised upon the farm, as every dollar put out for meal is a positive loss, unless dollar for dollar comes back as the direct result of feeding such meal.

5th. Heifers that are kept fat with meal will not breed, while those kept in good growing order on grass, hay and roots, breed readily.

Feeding meal to a bull, unless in very small quantities, is very injurious, to say the least, as it makes him ugly and renders him an unsure getter.

GOOD CROPS—CHEAP LAND.—The New-England Farmer remarks that there is plenty of land in Massachusetts that is not worth to-day in market ten dollars per acre, and yet such land can be made to produce good crops of rye and other grains, and at a profit, too. And good milk and butter can be made from cows kept on such food, if it is cut early and properly cured.

The Poultry Yard.

LEGHORNS vs. PLYMOUTH ROCKS.

G. D. B., whose communication to the RURAL appeared in the issue of September 28, seems to me to have made a much greater error in his poultry record by omitting to state the amount of feed consumed by his Plymouth Rocks, than I did in my note published on September 14, in failing to state the number of eggs my Leghorns laid each month. I did not consider the number of eggs they laid an exceedingly large yield for well-fed hens; but I do believe that with the same care and feed, it cannot be beaten by any breed of fowls. I should like to hear from others who are testing, or have tested, the Leghorns as layers. I think that breeders generally pronounce them one of the best egg-producing breeds, G. D. B.'s evidence to the contrary notwithstanding. "ANON."

Industrial Societies.

THE GREAT ST. LOUIS FAIR.

The eighteenth annual fair of the St. Louis Agricultural and Mechanical Association has come to a successful close. For the character and extent of the general display, this collection is more like one of the great European fairs. The exhibitors are supplied with accommodations that permit them to show their wares to the best advantage, and this consideration on the part of the Association is reciprocated by manufacturers, as is evidenced by the fact that they exert themselves to show the best machinery in the most attractive forms that they are capable of producing. This is undoubtedly the great implement fair of the country, and the representation this year fell little short of the display made at the Centennial.

The accommodations for live-stock, poultry, etc, were equally good, and the representation in these classes was never better. I regret that time forbids more than a running mention of the various breeds. Indeed, the extent of the grounds—eighty-five acres—makes a complete report an impossibility. None but an O'Leary or a Centaur could make the grand rounds and have time to do justice to all departments.

There were 135 head of Jerseys on exhibition, 56 of which were shown by Churchman & Jackson; of these 20 were imported stock. Messrs. Miller, Stratton, Barber, and Turner & Kirkman also had well-filled stalls. The Devons were only 21 strong, but quality counterbalanced a fuller representation. L. F. Ross, whose herd of 18 took the first premium at Illinois State Fair, was here. The Short-horns made a sorry showing, and indications would seem to point to the declension of the furor for this breed at the West. The herds of Pickerell & Kessinger and J. H. Potts secured the most attention. T. L. Miller, Thos. Clark and W. Powell entered herds of Herefords; a fine yearling, the property of Mr. Constance, scored a first premium. The hog in agriculture always makes a notable figure, and here some six hundred—the gallant six hundred—ably sustained the class, the black breeds taking the lead. In sheep, the long-wools secured the honors of representation "by a large majority." Horses, both draft and road, were numerous. As curiosities, the largest and smallest horse in America, so asserted, focused the gaze of the curious, while such famous fellows as imported Intruder, Plantagenet, Illinois Chief, Rob Roy, etc., attracted the good judges of horse flesh.

In Textile Hall were gathered most of the local exhibits of a miscellaneous character, which differ merely in detail from similar exhibits the country over. Being in a commercial center, this fair has the resources of the city to make drafts upon, so that it does not require a nimble imagination to picture the gorgeous quilts, the piano war, the patent flap jack turners, *et al.* so dear to the hearts of the ladies.

Produce Hall contained a few remarkably fine exhibits, but as a whole was far below the other departments, and very far below what one would expect in such a rich farming district. Although Missouri is the third corn-producing State in the Union, there were but four exhibitors of corn, who showed altogether seven samples. Oats, barley and potatoes were no better represented. Wheat there was in considerable quantities and of very superior quality—Fultz and Clawson being the favorite varieties. Only two exhibits each of garden vegetables and honey were made. Dairy products were unusually well represented, and of as fine quality as is often seen at any of the Eastern fairs. Leaf tobacco, rye, castor beans and flax, all of which are largely grown in the State, were entirely wanting. Fruits were as good as could have been expected at a fair held so late in the season, and in a year when all fruits are nearly a failure.

Such an imperfect display seemed unaccountable until the premium list for the present year was compared with those of former ones, when it became apparent that the Fair Association was doing its utmost to crowd out the agricultural features of the fair, and to promote the stock and mechanical departments. For many classes of farm products no premium whatever was offered, and many of the remaining premiums were only half of what had been offered in previous years. Such a course is certainly unwise as a very large proportion of the attendance comes from the farming community, and if the farmers are not invited to come and exhibit the fruits of their labors, they will very soon take the hint and stay away.

The largest, and by far the most valuable exhibit in the Hall was one made by the Missouri Agricultural College. The collection contained forty-eight varieties of wheat, twenty-five of oats, sixteen of corn, and two hundred of potatoes. The wheat and oats were shown in sheaves, the grain in glass jars; the corn in half-bushel samples, and the potatoes in five-pound boxes. Every specimen was plainly labeled with the name of the variety and yield per acre, so that the comparative value of the different sorts could be seen at a glance. Among the potatoes were thirty unnamed seedlings that had been sent to the College for trial. Some of these gave a wonderful yield, and promise to be of great value. Several fine seedlings raised at the College were shown. The exhibit was constantly surrounded by a crowd of inquiring farmers, and showed very plainly that valuable practical work was being done at the College.

But the machinery was the conspicuous figure. Many firms own permanent buildings which enable them to show off their exhibits in the most attractive manner. One of these, Semple, Birge & Co., had a building filled with all kinds of agricultural machinery. Walter A. Wood, Whitman Agl. Co., Furst & Bradly Mfg. Co., Deere, Mansur & Co., Jas. A. Field, Son & Co., Moline Plow Co., C. Aultman & Co., and nearly all the prominent manufacturers of the West were represented, while the makers of small implements for multitudinous purposes were legion. The self-binders did a brisk business, tying up bundles with the ease and grace of a dry-goods clerk, and in fact, most of the machinery was in motion, the agricultural steamers that were present in numbers being utilized for the purpose.

The fact that the agricultural fair was not the only attractive feature may account for a part of the large attendance. Thirty-five acres are devoted to a zoological garden that counts hosts of admirers, and the divertisements were plentiful. The grounds being situated some three miles from the center of the city, made it difficult to reach them in comfort. The car lines had not the resources to accommodate the crowd, and the Jehus arranged prices in a way that left no room for doubt as to "What will the harvest be?"

J. A. Field, Son & Co. made a fine exhibit of their Giant Corn Mills and other goods for which they are general agents. They had their Corn Mills in full operation showing the farmers how to utilize the full corn crop by grinding the husks and cob with the corn. Since this mill was illustrated in the RURAL they have improved it by adding a grinding rim to the inside grinder and a corresponding rim on the outside grinder. This improvement doubles the capacity for fine grinding at a very small additional cost. It really cheapens the grinder, for the rims can be replaced for one-third the cost of the old grinding-plates. A new patent adjustable shell is also a great improvement, as by a simple device the wear is taken up by lengthening the shell. The grinding cone is also adjusted to grind at all times in a satisfactory manner.

The Springfield Mfg. Co. of Springfield, Ill., made a fine display of Corn-Planters. They had on exhibition their "Climax" and "Boss" two-horse planters, and "Capital" hand-planter, and "Sucker State" one-horse corn drill. The latter attracted a great deal of attention. It combines simplicity of construction with accuracy of operation. A number of these drills have been sold in the East, and wherever used have given the best satisfaction. It is a cheap, durable and efficient implement.

The St. Louis office of the Gibbs & Sterritt Mfg. Co. (Cory, Pa.) made a fine display of their celebrated Climax Mowers, Droppers and Self-Rakes. This concern has done a very large business during the past year, their sales being far ahead of the previous one. The Climax machines give the best of satisfaction wherever used, and their sale is being extended all through the Southwest as well as the East. They bring out this year a new light mower weighing less than 600 pounds. A number of these have been put out on trial and have stood the severest tests. They will be put on the market for 1879, and I have no doubt will more than meet the expectations of their originators and mow their way to the front rank.

THE FARMERS' FRIEND GRAIN DRILL.—Among western farmers the "Farmers' Friend," manufactured by the Farmers' Friend Manufacturing Co., Dayton, Ohio, has become a household word, and at this great western fair, the drill is always exhibited to crowds of enthusiastic friends and patrons. The drill has recently been the recipient of very great honors at Paris, where the company entered their exhibit against all competitors in its class, with the most satisfactory results, a large placard over their exhibit at the St. Louis fair announced its success at the Paris Exposition over twenty competitors, after extended field trials, so that the gold medal awarded the drill was earned by superior excellence in the field. The company has just been notified that it is the recipient of another gold medal at the hands of different judges. These medals in conjunction with the honors bestowed at the Centennial, give this drill peculiar *prestige*, as having received the endorsement of Europe and America to the claim of being one of the leading implements in its class. In 1877 the Farmers' Friend also took the premium at the St. Louis fair. This year the company did not enter for competition, but had a fine display of samples showing their different machines and attachments. The features that most contribute to its success in the field, it is said, are the double force-feed which is brought to perfection in its different parts, and then never disturbed, and the cone-gearing by which the quantity is regulated by simply moving a lever which changes the speed of the feeders. The general construction of the drill, and the arrangement of the hoes in particular, cover some very nice mechanical points. In these latter a rubber spring pressing on the end of a lever keeps the hoe in its normal position, which is held there by a latch so arranged that a continuous strain makes a positive lock, but the moment a quick, sharp blow is given, it starts the little roller in the latch, and the hoe gives way, to be brought back to position by the rubber spring as soon as the obstruction is harmlessly passed.

P. P. MAST & Co., Springfield, Ohio, were out-and-out Buckeyes, having on the ground the Buckeye Grain-drill, Buckeye Cider-mill, and Buckeye Cultivator. The drill and cultivator captured the first premiums. The Buckeye drill is too well-known to need much comment, but it has recently been improved by the addition of a fertilizer attachment that is in itself a most complete apparatus, and has greatly enhanced the value of the drill when it is desirable to sow commercial fertilizers with the grain. This attachment was fully illustrated and described in our issue of September 7.

The cultivator is rapidly advancing in favor; the sales last year included over five thousand of these implements. Its good points are its adjustable axle by which the wheels can be thrown forward or back, which permits the driver to throw the downward draft in front or rear of axle, thereby properly balancing the cultivator in hard or soft ground. The high wheels and broad tires insure light draft and sufficient hight to pass over corn, in the last plowing. The foot-treadles are a very good device, and one of the greatest conveniences about the implement.

R. H. W.

Dairy Husbandry.

A VERMONT CHEESE DAIRY.

T. H. HOSKINS, M. D.

I AM fond of good cheese, and as it is rarely to be had in the stores, I have now for some time purchased my small supply of a dairyman living in an adjoining town, who was highly recommended to me, and whose cheese I have found to be of remarkably high and uniform quality, keeping well, and improving in flavor for at least a year. Thinking the readers of the RURAL would be glad to hear how such cheese is made, I have recently visited the dairy referred to, that of Deacon J. C. Oliver, of West Charleston, Vt., and received from Mrs. Oliver a detailed description of her process of manufacture, which she calls "the old-fashioned Franklin County way, before cheese-factories were invented."

THE RENNET.

The calf is killed in the morning, fasting, and the stomach, when removed, is slit open and its contents, if any, shaken out. It is then filled with pure salt, laid on a plate of salt, and covered with salt. This plate, with others, is set upon a shelf in the cheese-room and left to dry; the rennets being occasionally turned over. When dry, they are packed in salt. Before using, they are soaked out in warm brine and rubbed thoroughly and repeatedly. The solution thus formed is strained, and is perfectly sweet and free from the least offensive odor,—indeed having scarcely any odor at all. One rennet makes from 175 to 200 pounds of cheese.

THE VAT.

The vat is a pine box about four feet long, two feet wide and twenty inches high, well painted within and without. It is supported upon a stand which permits one end to be raised about six inches when desired. In the middle of the other end are three holes, one above another, at about two, six, and ten inches distance from the bottom. There is also another hole in the bottom, close to this end. These holes are about three-eighths of an inch in diameter, and are fitted with pine plugs.

THE MANUFACTURE.

The milk of 16 cows is used, and a cheese of from 35 to 45 pounds is made every morning. The cows are of the common stock, well fed and cared for. Cheese-making begins the first of May; before that, butter is made. The night's milk is set in pans, and in the morning the cream is skimmed off, the skim-milk heated in a kettle not quite to the temperature of new milk, and added to the fresh morning's milk in the vat. The cream from the night's milk is heated *scalding hot*, and then stirred into the vat. No cream is lost in the manufacture; there is not enough on the whey to make it worth saving for greasing the cheese, as is often practiced. The dissolved rennet is added to the contents of the vat, stirred, and the whole covered with a cloth and left for half an hour. When the curd is set, it is cut coarsely in squares of, say, four inches, and left to stand twenty minutes to let the whey start. It is then broken by hand, "with a sort of rolling break," as Mrs. Oliver says. This is the most difficult art to acquire in the whole process, so as to break the curd up fine, and yet not make the whey white, thus losing the richness of the curd—when broken, the curd is covered and again left to stand twenty minutes.

The scalding of the curd is effected by drawing off two pailfuls of whey, heating it to scalding heat and pouring it back into the vat. This is repeated usually three times; in the warmest weather only about half as much whey is used for the third scalding. The purpose is to scald until the curd "creaks" slightly under the teeth. In this process no acidity is developed; the method is therefore the "sweet-curd process," which is now being put forward by Prof. Arnold.

When the curd is properly scalded, as above, the whey is drawn off, the curd salted to taste, and removed from the vat in milk pans to the buttery. The curd-making is finished about nine o'clock, and the curd is left in the pans to cool until noon, when it is put to press in a "self-presser," or automatic press, where the cheese is pressed by its own weight, for 24 hours. The bandages only are colored, no color being used in the cheese. No thermometer is used, so that I am unable to give the exact temperature in scalding, etc., and the salt is not weighed, but judged by tasting the curd; still, the product is so uniform that one cannot doubt that Mrs. Oliver's "scalding hot" is a very uniform temperature, and her judgment of the right degree of saltness, very accurate.

I have been thus particular in the account of the way in which this cheese is made, because it is a really first-class article in every respect. If our cheese factories could make as good, generally, the export value of their product would be raised several cents a pound, and there would also be a much larger home demand. But the difficulty is that first-class cheese cannot be made where everybody's milk and all kinds of milk are used. The factory system is a good one in many respects, but the only way in which first-class cheese can be made in them, is for them to use milk only from selected dairies. There is one such factory in this State, run by Mr. Mason, the president of our Dairymen's Association. His cheese is quite equal to the choicest English, and is sold in advance of manufacture to first-class hotels and restaurants in New York and Philadelphia. It is as far superior to common factory cheese as Mrs. Oliver's is to the common farm-dairy product. I hope soon to give RURAL readers the details of Mr. Mason's method.

Orleans Co., Vt.

Everywhere.

RURAL SPECIAL REPORTS.

CORNING, Steuben Co., N. Y., Oct. 10, 1878.

The weather is now delightful and it has been quite favorable to the agriculturist the past season, and now he is gathering in his late crops, and getting ready for winter. Soon the stock will have to be put up and tended; and no time should now be lost in fixing up the barns, and sheds, so as to be ready when needed. I find that these matters are usually neglected, and finally winter closes in upon us before we are ready; therefore let us try and get prepared, for once, in season.

Crops, on the whole, have yielded quite well with the exception of potatoes; these are very light indeed; some fields I hear of, are scarcely worth digging. The hay crop was very abundant and much more had to be stacked than usual for want of barn room in which to store it; $7 is all we can get for the best of hay, delivered at the hay press. It seems to me it is better to feed it to stock than sell it at that price, when one has to draw it four or five miles; yet many will draw it twelve and fourteen.

On the morning of the 23d ult., on waking up, I discovered that there had been a very heavy frost, killing all tender plants that were not covered up, and ice formed as thick as window-glass. On the 27th, we had another heavy frost. Last year our first frost did not come until the 5th of October.

Of four varieties of sweet corn grown hereabouts this year, the Farmers' Favorite is pronounced to be the nicest at our table. Will some of the RURAL's correspondents let us know their opinion about the best sweet corn?

I was glad to notice the sensible article on plowing, in the RURAL, page 614, by "A Jersey Farmer." Good plowing is the foundation of good farming; for without good plowing, good crops can not be expected. I have often been disgusted at the slovenly manner in which some men plow. To be a good plowman, one must take pride in what he is doing, and he must also have a good plow, as well as some practice. On no farm can one plow be used for all kinds of plowing, with satisfactory results. I do not like a land-side plow, on most fields, (unless they are wet.) so well as a swivel plow. I believe the swivel plow as now constructed for level land as well as hill-side, possesses many advantages over the land-side plow; and, before long I believe that it will come into general use here, the same as in New England. At the late trial of plows at the New England fair, none but swivel plows were admitted.

Prices of farm produce are about as follows: Wheat, $1 to $1 10; corn, 50 cents; oats, 50 cents; rye, 50 cents; barley, 70 and 80 cents;

beans, $1 to $1 25; potatoes, 60 to 70 cents; butter, 17 and 18 cents; eggs, 16; chickens, 7 cents alive, and 12½ dressed. F. H. D.

OWENSBORO', Ky., Oct., 10, 1878.

No frost yet to hurt the tenderest plant; weather very warm for Oct.; health hereabouts unusually good. The Daviess County "Agricultural Hoss Trot" is under way now—9, 10, 11 inst.—having, as a *secondary* feature, fine stock and other farm products. Fast horses got big premiums and only 10 per cent. off; other things, small premiums, with 30 per cent. off. Now is it an exhibit such as ought to be made by an Agricultural, Horticultural and Mechanical Association, or is it merely what Josh Billings calls an "Agricultural Hoss Trot?" I think Josh is right.

The tobacco crop is about 50 per cent. of last year's yield. Corn and potatoes are short; hay is fine. Irish potatoes are selling at 40 cts. per bushel; sweet potatoes, 40 to 50c. Hogs are plentiful, $3 $3.50 gross. Farmers are about half-way through seeding. A large area of grain will be sown. Wheat is worth 80c.; rye, 45c. The sorghum crop is good, the supply being greater than the demand; price 25 to 40c., according to quality. S. W. S.

JONESVILLE, N. Y., Oct. 15, 1878.

Our season, from May to about the middle of August, was very wet. Oats were badly damaged in gathering; but few escaped drenching showers. Most of the oat-straw was ruined for feeding purposes. Corn is a fair crop. Potatoes can hardly be mentioned as a crop in this section; but few were planted, and the yield is very light. Many farmers, who formerly raised potatoes largely for market, will have to buy for family use. Grass was a fine crop. Prices range as follows: Oats, 30@35c.; corn, 50@55c.; rye, same as corn; potatoes, $2@$3 per barrel; butter, 20c. per lb.; pork, $5.50 per hundred. The weather, at this writing, is delightful. There has been but little rain for weeks past. No heavy frosts. Apples abundant; market glutted; many are selling fine grafts for from 50c. to $1 per barrel. F. B. W.

PENSACOLA, Florida, Oct. 25th.

This is a place of about 4,000 permanent inhabitants, a number increased by about from 1,500 to 2,000 every winter and spring, during the season for shipping timber. Our harbor, consisting of a part of Escambia Bay, is the finest in the Mexican Gulf, and capable of affording ample anchorage to the fleets of the world, while the depth of water on the bar at its entrance, is enough to allow the largest vessels to pass. From 100 to 500 sailing vessels of all kinds are at anchor here in the winter months, taking on board hewed timber—chiefly yellow pine—brought down in large rafts from Escambia and Santa Rosa counties, Fla., and from the lower parts of Ala. W. H. O.

WEXFORD Co., Mich., Oct. 8th.

We have had a long, warm season here with no very hard storms or very severe droughts. The frosts in the spring damaged winter wheat to some extent, still it was a fair crop. Owing to the cool, backward spring the hay crop was not as good as usual with us. Oats and corn are good. Potatoes are fair. The potato beetles have left this place for parts unknown. Prices are low, though perhaps better than they will average throughout the country. Wheat, 75c. to 80c.; oats, 25c.; potatoes, 40c. per bush.

Any one wanting good land at cheap rates, in a healthy locality, will do well to come here. J. S. G.

BRIGHTON, Montgomery Co., Md., Oct. 9th.

Wheat sowing is progressing rapidly, while some fields are already commencing to show a greenish tinge. The most popular varieties of wheat hereabouts are the Fultz and Boughton. The Fultz is gaining popularity by its better yield, though its quality is not the best. Wheat this year is below an average crop. Corn, on poor land, is above an average; on rich, below, owing to an excess of rain in the early part of the season. Early potatoes are a fair crop; late, not yet dug. The butter market is improving; the best print is now selling for 40c. wholesale in Washington market. G. L. S.

NEW RICHLAND, Logan Co., O.

Crops hereabouts are good; wheat never was better in this county; corn is a fair crop; oats and hay are good; fruit is a fair crop; apples, however, are not as plentiful as two years ago. Stock of all kinds are low; horses are very dull sale; fat cattle, $3 50; stock, $3 00; hogs, $3.50 to $3.75. Grain, too, is very low; wheat, 85 to 88c. per bush.; corn, 35c.; oats, 18c. Wages from $1 to $1.25 per day, from $15 to $20 per month. Hands have been very hard to get this fall—plenty of tramps, but they will not work. Land is worth from $40 to $75 per acre.

PAINESVILLE, Lake Co., O.

The crop of grapes this season is not such as to inspire enthusiasm with regard to the future of grape culture. M. B. B.

ARKANSAS CITY, Cowley Co., Kan., Oct. 11.

Wheat here brings only 40c. per bushel. T. C. B.

CAMBRIDGE, Mass., Oct. 16, 1878.

No frosts, but leaves are falling. W. F.

The Querist.

ANSWERS TO CORRESPONDENTS.

Grasses for a permanent Pasture.

Van, Brown Co., Wis., says: "My thanks are due to Messrs. CURTIS and BEAL for their information about Orchard-grass. I am trying a small plot and an acquaintance is doing the same. There is a defect in our meadows owing to our giving too much attention to lumbering until within the last four or five years, and letting our farming take care of itself. We sow only clover and Timothy and the clover dies while the Timothy runs out in wet spots, and in come water, reeds and coarse grass. Now what mixture would Prof. BEAL recommend for a permanent pasture or rather for a lot near the house on which to turn cows at night—soil a heavy red clay on a blue clay subsoil?

ANSWER BY PROFESSOR W. J. BEAL.

Yes, the clover dies in two years unless it is reseeded, as it only claims to be a biennial and the Timothy runs out in a short time as it is unfit for a pasture grass in any place, except for a single season. If Orchard-grass be used alone, sow two or three bushels to the acre. Instead of Timothy, sow June-grass; also Meadow-fescue. If grass is wanted, there is no advantage in sowing oats or rye or anything else to shade it, any more than there would be in planting corn in a field of wheat to shade the young wheat plants. If sown early in spring without any other crop, the grass will start early, and the owner will doubtless be astonished to see how fast it grows. I should sow, to guess at the location, a bushel of Orchard-grass, a bushel of June-grass and a peck of Meadow-fescue. All these are of good quality, and with suitable soil and climate, will last for many years.

Works on Farriery.

W. C. P., Pierport, Mich., asks for the name of the best complete work on farriery, suitable for ordinary farmers.

ANS.—There is a considerable amount of difference of opinion with regard to the merits of the works of various authors who have written on diseases of the horse. Even among those who are acknowledged experts in the veterinarian profession there is a world of disagreement as to the best methods of treatment of some very ordinary ailments. Amid such conflicting opinions it would, therefore, be no easy matter to decide absolutely which is the best work on this vexed subject. A few of those we consider among the best are here mentioned in what we think their order of merit.

AMERICAN EDITIONS OF FOREIGN WORKS.—Stonehenge's—The Horse in the Stable and Field, 8vo, $3.50; 12mo, $2.

Mayhew's Ill. Horse Doctor, $3.

WORKS BY AMERICAN AUTHORS.—Stewart's American Farmer's Horse, $3.

Jennings on the Horse and his diseases, $1.75.

Dad's Modern Horse Doctor, $1.50.

Certainly among the best works on the diseases of farm animals is the Farmer's Veterinary Adviser, by Prof. Law, of Cornell University, price $3.

Any of these can be procured through this office.

Germination of Seeds.

A. C. W., Hugo, Ill., asks how to raise the following plants, from seed: Clematis, Purple-leaved Berberry, Deutzia gracilis, Weigela, Althæa, Cornus sanguinea, Juniper, Norway Spruce, Australian Pine, etc.

ANS.—Clematis seeds generally require a long time to germinate—sometimes one, sometimes two years. Planted now, many may germinate next spring; but most would not until another year. Deutzias, Weigelas and the other shrubs will germinate readily; those of the evergreens mentioned will also germinate readily if planted as soon as ripe. A good plan is to sow them now in cold-frames.

Making Hard-Stick Candy.

A. M. O., Savannah, Ga., asks for a recipe for making hard stick candy.

ANS.—The hard-stick candy is made by using 3½ pounds sugar, 1½ pint of water, and 1 teaspoonful of cream-of-tartar. If it is wished to make the clear candy, manipulate the mass as little as possible after turning out on greased tins; if clouded candy is wanted, pull it or stir it until the desired opaqueness is secured. "How to Make Candy" a book costing 50 cents, and to be had through this office, gives complete directions for making all kinds.

When to Plant Strawberries.

U. T. S., Bear Canon, Col., asks how late may Strawberry plants be set out, and how are they usually sent a long distance by mail.

ANS.—Strawberry plants, if properly put up, may be sent upon a week's journey without materially harming them. The sooner they are set out the better. They need some time before sharp frosts to become "established" in their new quarters. There is very little gained by fall planting. A partial crop is secured the first summer, but we fancy that this is lost subsequently.

Is there a Mole Exterminator?

W. H. M., Haddonfield, N. J., having had his entire front lawn badly cut up by moles, and having vainly tried several kinds of traps against them, inquires for some method of getting rid of the pest.

ANS.—Speaking for ourselves, we cannot give our correspondent any remedy. We have been troubled the same as he has been for years, and have tried everything that seemed to give the least promise of exterminating or driving them off, without any success commensurate with our pains. Has any reader of the RURAL ever found an efficacious method of extirpating the annoyance?

Miscellaneous.

Enoch Auter, Cedar Co., Iowa, raised the Lost Nation Wheat this year. It suffered from the heat just like other varieties, but it yielded 20 bushels per acre while they yielded only ten. He asks the difference between Lost Nation and Defiance Wheat.

ANS.—The Defiance is a spring wheat originated by Mr. Pringle, of Vermont, by hybridization. Lost Nation is an Oregon wheat. There is some sort of story attached to it about its being found in a mound, which is, no doubt, all humbug—like the other wheat that also came from Oregon, that was said to have been taken from a wild goose's crop, and which was said to have come from a long distance. But how far a wild goose could carry wheat in its crop before it was gizzarded and digested, we don't exactly know, but not more than a few hours, probably.

A. J. M., Seneca Falls, N. Y., asks, 1. For a good recipe for coloring hair. 2. The name of the best work on chemistry, which a farmer could study at home.

ANS.—1. There are numerous preparations for coloring hair, all claiming to be the best. Never having used any of them, we are unable to sit in judgment upon these claims. The next barber would be better able to advise on this topic. 2. Johnson's Agricultural Chemistry, $1.75; Norton's Scientific Agriculture, 75c; Johnson's How Crops Feed and How Crops Grow, $2 each, are among the best works of the kind desired. All can be had through this office.

P. H. F., Cobleskill, N. Y., asks us to republish an article on making capons, that appeared in the RURAL some years ago. We would do so to benefit him and others, were it not that an article containing a full account of the matter was published, among our Answers to Correspondents, as lately as the 20th of last April, on page 250 of current volume of the RURAL. Tools for performing the operation can be had at the office of the Pet Stock and Poultry Bulletin, Courtlandt street, N. Y. City.

J. H., Summerton, Erie Co., Pa, asks for some remedy or preventive of a repetition next year of the depredations of the little white maggot that last season destroyed the 6,000 Cabbage plants he had set out.

ANS.—From the date of this note it is evident that it was written before he received the last number of the RURAL, which contained, among Answers to Correspondents, two notices of this pest. We would refer him to these, and also to an article on the Cabbage Plusia, in the RURAL of Oct. 12, and to another on exterminating the Cabbage Butterfly, in our issue of Feb. 2.

Mrs. W. V., Oxford Center, Ont., asks, 1. How can Brompton Stocks and Wall-flowers be best protected through winter? 2. If Verbenas are kept in a cellar, do they require much light and water through the winter? 3. The names of the four best varieties of Grapes for glass-house, and the best time to plant them?

ANS.—1st. In a cold frame; or planted in boxes and kept in a light, airy cellar.

2d. All the light available; only enough water to keep the soil slightly moist.

3d. Black Hamburgh, Victoria Hamburgh, Lady Downes, and Buckland Sweetwater. Plant in early spring. But both in the case of varieties to plant and time of planting, much depends on local circumstances.

O. B. J., Battle Creek, Mich., asks where he can get a good, practical work on poultry-keeping.

ANS.—Tegetmeier's Poultry Book, $9. Saunder's Domestic Poultry Book, cloth, 75c.; paper, 40c. Wright's Practical Poultry-keeper, $2.

To be had through this office.

L. W. S., Pitcher, N. Y., asks the name of the tunnel on the Erie R. R. just before it reaches Jersey City.

ANS.—Bergen tunnel.

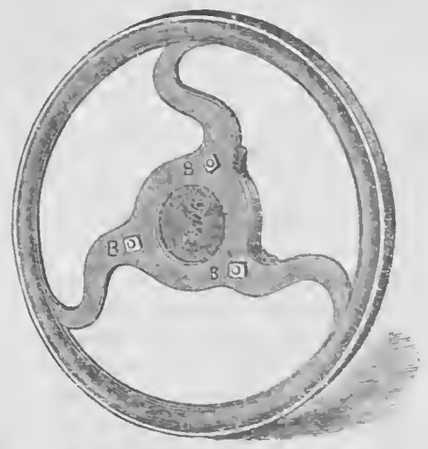
Industrial Implements.

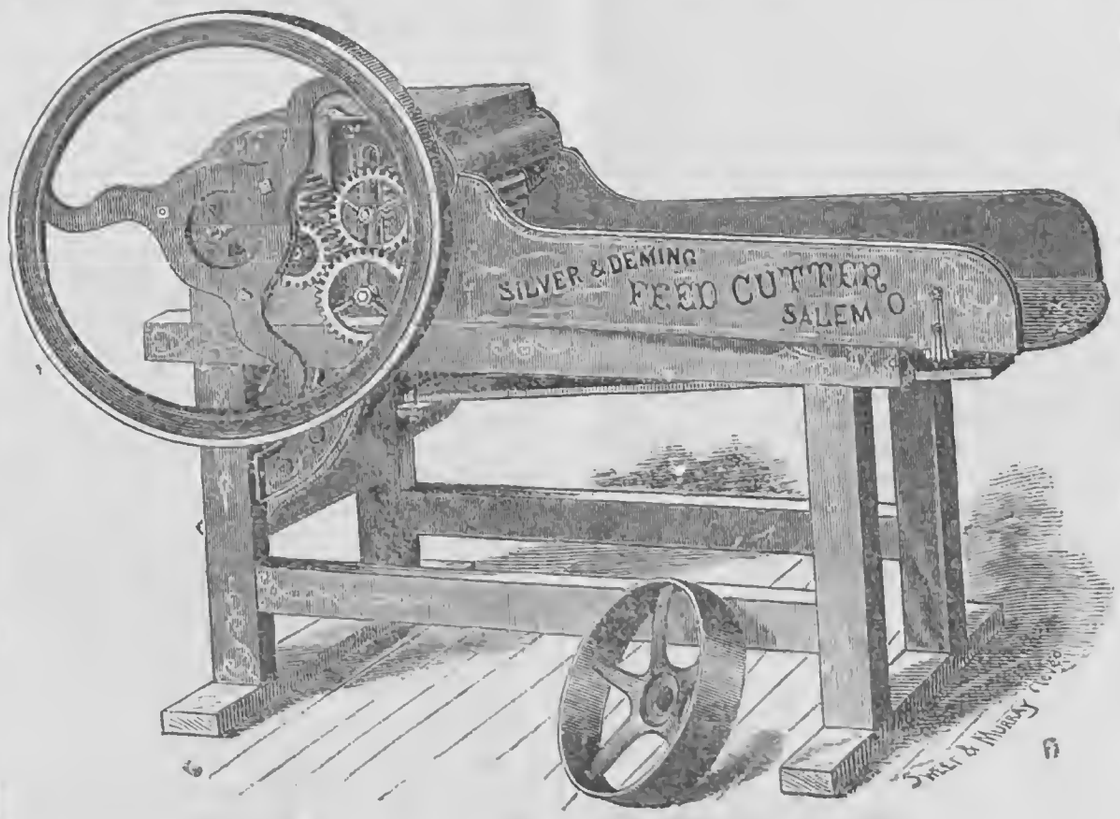
SILVER AND DEMING FEED CUTTER.

The illustrations in this department this week are explanatory of a new power feed cutter made by the Silver and Deming Mfg. Co., Salem, Ohio. The striking peculiarity of the machine is an independent safety fly-wheel, easily adjusted, and rendering an important service. The small cut shows this wheel detached. When applied to the shaft the nuts shown at B, are tightened



just enough to prevent the wheel from turning on its disc when the cutter is unobstructed. The instant iron or other hard substance enters its throat the knives cease revolving, but the fly-wheel continues to revolve, thus avoiding accidents that may be caused by a high speed when abruptly stopped; also oscillation of the fly wheel is prevented. The feed-cutter itself contains important features that we will briefly summarize. The adjustable feed roller has an extended vertical movement without materially altering the mesh of the gear wheel, which device overcomes strains caused by over-feeding. It is also maintained parallel with the stationary roller. The length of cut may be quickly changed without employing detached gear-wheels, that might be lost, or worse, run through the machine. No very small pinions are used, and the cutter-bar is made of hardened steel accurately ground, which secures a durable, sharp edge.

The machine received the highest honors a the Centennial for possessing the above good points. Five sizes are made ranging from a nine- to a twenty-inch knife. The cutter is commonly equipped with two knives, but four are furnished, if desired, at an increased price. The nine-inch machine is made for hand use but may be run by power. The mechanical finish and material seem to be, in every respect, satisfactory, and the work is performed in a superior and rapid manner. Circulars containing details may be had on application.



THE SILVER & DEMING FEED CUTTER.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address

RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY OCT. 26, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

COUNTRY ROADS.

ROAD-MAKING as an art is but poorly understood by the majority of our highway surveyors and road-masters, and what they do know is not always well carried out. There is, no doubt, a gradual improvement in our highways. The loss and injury occasioned by gullying and wash-outs are so great that those means by which stability of the traveled way is secured, are getting to be tolerably well understood. But the other points, such as securing easy grades, conducting a road over a swamp, the management of clayey or mucky soils, and the removal of stones, both fixed and loose, are all matters in which our rural road-builders may easily improve their methods. In every farmers' club, grange and agricultural gathering for the discussion of rural affairs, road-making should be made a matter of frequent consideration.

The losses by reason of bad roads are very large—far greater than the cost of maintaining good ones. But they are so uncertain as regards particular instances, and so divided among all hands, that the sum of them is not realized as it ought to be. The load that can be drawn over a road is limited by the load that can be drawn over the worst places, just as the strength of a chain is only the strength of its weakest link. The strains thrown upon the different parts of a wagon or carriage, upon the bolts and braces, the wheels, axles, pole, shafts, and on the harness, (to say nothing of the horses), by steep grades and the unevenness of the road-bed, by deep mud, and by stones, are also matters that are large enough in detail, but form a monstrous aggregate far beyond the conception of those who do not figure in regard to them. We believe that there are few traveled roads in the country on which the unnecessary injury to vehicles alone would not pay, and more than pay, for the cost and maintainance of a first-class turnpike.

There is one thing, in particular, which would cost but little to remedy, that is very destructive to wheels, the most costly parts of every vehicle, and which is also the cause of very great injury to horses. We refer to the loose stones left upon the surface of the roadway—thrown upon it, in fact, when the roads are repaired, and left there the whole season afterwards. These stones could be all thrown off in a very short time and at very little expense, but they are very rarely attended to. How many loosened and broken tires they cause, and how many horses' feet are injured by these provokingly loose stones in the road!

Other bad things, easily remedied, are the holes and hollows worn in the road by wheels, and rapidly increased in depth by the softening caused by the collection of water in them after rains. These holes break more axles, bolts, braces and spokes, ten times over, than the cost of filling them up would amount to. A "stitch in time" is here most important, but few road-masters will attend to the matter as they should.

We repeat that these are things worthy of frequent discussion among farmers, so that knowledge regarding the proper remedies may be disseminated, and, above all, a public opinion be created in favor of good roads. The civilization of a community is almost as well guaged by the condition of its roads as by the quantity of soap it uses.

CLEANLINESS OF STABLES.

WE frequently come across remonstrances against keeping harness in stables, the reason given being that the ammonia prevalent there rots the leather and soon destroys the harness. Now, this is beginning at the wrong end to remedy an evil. We may talk and advise "year in and year out" about this matter, but harness will be kept in the stable in spite of all. Where else can the majority of people who keep horses hang these trappings? A rich man may have a closet in which the harness may hang safely from fear of ammonia and all other dangers; but the average horse-owner will have his peg behind the beam, because he can have no other way of disposing of the harness. But the trouble would end if the production of ammonia in the stables was prevented. Enter an ordinary stable at any period, but especially in the winter when every cranny through which the wind can come in is carefully stopped, and what a pungent odor offends the nostrils and irritates the eyes! Is this odor of ammonia, strongly alkaline and irritant, injurious only to the harness? What of the horses and the tender membranes of the eye, the throat and the nasal passages? Do you think they are less sensitive than oak-tanned harness leather, well greased and preserved, as it is? By no means. If the prevalent odors injuriously affect the leather, you may be sure the eyes suffer; the throat and lungs are irritated and the nasal passages become inflamed. Then occur the frequent moon blindness; ophthalmia; weeping of the eyes, followed by inflammation, white specks, clouded cornea, and finally loss of sight; then follow coughs, bronchitis, pneumonia, heaves, catarrh, nasal gleet; and by and by, when the blood has become poisoned by the absorption of diseased matter from inflamed and suppurating membranes, farcy and glanders—dreadful and fatal to beast and man, too—result. And while we think of saving the harness and removing that to a purer place, the beast, which is worth a dozen sets of it, is left to rot from these pungent gases without any help. Clean the stables and the harness may hang in them safely; and be sure, if the stable is not a fit place for the harness, it is no place for the horse. A barrel of plaster can be procured for about one dollar. It is worth that as a fertilizer. It is worth ten dollars as an absorbent of ammonia, and a hundred as a health preserver to the horses; not counting the saving to the harness. Sprinkle it everywhere and be liberal with it.

THE VALUE OF HEN MANURE.

THERE is hardly a subject upon which more is written, by the correspondents of the agricultural press, than this. Every novice in gardening and farming, especially, is enraptured by the fertilizing vigor of this kind of dressing for the soil. And they are right,—the dung of fowls is a valuable manure. We want to say here, briefly, just how and why it is valuable, and draw a little moral at the end.

A great many, but not all, know that the urinary secretions of birds is discharged, not externally as in mammals, but into the bowels in a semi-solid form, and passes off mixed with the dung. There is, therefore, no loss of what we call the "liquid manure" in the case of fowls. All the valuable fertilizing salts, the potash, the phosphoric acid and the ammonia, which the kidneys excrete from the blood, are contained in the dung of fowls. They are there in a very concentrated and yet very soluble form, ready to yield a potent nourishment to the young plant,—too potent, without considerable dilution. Then again, our fowls live mostly upon a concentrated diet, chiefly seeds and insects in the summer, grain and meat in the winter; and the result of the digestion of this strong, rich food is a strong, rich manure. Fowls fed upon potatoes do not yield a rich excrement.

And, finally, our hen manure is made and preserved under cover, suffering no loss from the leaking or fermentation which always occurs when more or less water has access to any fertilizing substance of animal or vegetable origin.

"This fable teaches" the importance of preserving the urinary excretions of all domestic animals, as well as the solid manure, and of protecting both from loss by leaching or fermentation. Were this attended to, the manure of all grain-fed animals would be nearly as strong as that of fowls, and as valuable for fertilizing purposes. At the present price of commercial fertilizers, the like ingredients in a cow's urine are worth at least twelve dollars a year. It is a great loss on a stableful of animals when all, or most of this goes to waste, as is too commonly the case.

OUR EXPORTS.

AN enumeration of some of the exports from the port of New York in a single week, will give a very clear idea of the wonderful wealth of resources and material, and the extent of the foreign traffic of the United States. For instance, in one week in September there were two million bushels of wheat shipped abroad. Manufactures and produce were sent to 57 foreign ports. Of these the largest business was done with Liverpool, the amount being $1,667,360. This included 300 tons of fresh meat, 360 kegs of tongues, oysters, toys, chromos, shoe-polish, $62,000 worth of butter, nearly $300,000 worth of bacon, $283,000 worth of tobacco and $223,900 for wheat. London took $500,000 worth of goods, among which were 300 sewing machines, 730 packages of wooden ware, 500,000 lbs. of cheese, 156,000 bushels of wheat, and 4,515 cases of canned goods. Glasgow took 42 bbls. of shoe pegs and 1,200 cases of canned goods and other merchandise to the value of $200,000; $58,211 worth went to Japan; $500,000 to Australia, which took 1,397 packages of agricultural implements, 125 bbls. of shoe pegs, a lot of wind-mills, pumps, etc.

Good Laws on Land Drainage.—A proposed amendment to the constitution of the State of Illinois, which has to be voted on by the people at the coming fall elections, provides that the general assembly may pass laws permitting the owners of land to construct drains, ditches and levees, for agricultural, sanitary or mining purposes, across the lands of others, and provide for the organization of drainage districts, and vest the corporate authorities of such organizations with power to construct and maintain levees, drains, and ditches and to keep in repair all such improvements heretofore constructed under the laws of the State, by means of special assessments upon the property benefited thereby. The enactment of such laws as this amendment authorizes, would be of vast benefit not only to Illinois, but to many othes States in the Union. For not the least of the difficulties individuals and communities encounter in carrying plans for drainage into execution lies in the opposition or the lack of co-operation of other parties interested.

Mildew.—It has been remarked by one of our contributors, that the leaves of those grape-vines whose fruit buds were killed by the late spring frost, have not been injured by mildew. In so far as we can recall, they are seldom attacked before the fruit begins to form. It is the same with the leaves and fruit of the Gooseberry. Whether fruiting so weakens the plant as to present conditions more favorable to the growth of this fungus, or whether the time for its germination is not until fruit begins to form, we cannot say. It is a fact, however, that thrifty plants, both of the Grape and Gooseberry, are attacked by mildew during some seasons when no fruit is borne.

BREVITIES.

PLANT a Grape-vine.

THE best fruit to plant in City gardens—Grape-vines.

PROBABLY one of the very best deodorizers is fine dry earth.

WHICH grapes suffer most from rot—the white, red or black varieties?

FROM many different parts we hear good accounts of the Lady Grape.

ALL of our Grape portraits we have had drawn from life—and they are true portraits.

AMONG Rogers' Hybrids, Salem (red) and Goethe (yellowish-green) are among the best.

MAY not the Delaware be said to occupy about the same place among Grapes that the Seckel does among Pears?

WITHOUT regard to their manufactnre into wine, do not our hardy Grapes at the present day rank next in importance to the Apple?

MESSRS. ELLWANGER & BARRY send us a box of Bonne du puits Ansault pears, of which we gave a drawing from life Nov. 10, of last year.

THE Massachusetts Ploughman, in its issue of Oct. 5, gives a picture of "Moore's Esrly Prize Grape." As represented it is the largest hardy grape we have ever seen.

MR. MARVIN'S classification of Grapes most suitable for the latitude of northern New York, given elsewhere in this issue, is the result of no small amount of care, judgment and experience.

MR. ROGERS is, we believe, entitled to the credit of first attempting upon an extended scale the hybridization of our native with the foreign sorts of Grapes. Many question whether they *are* hybrids, since the marks of the foreign species are rather feeble.

THE RURAL of next week will present a large engraving of the "new" fodder plant Pearl Millet. Some of our readers may doubt that so many stalks proceed from one seed. We shall, perhaps, be enabled to give them the opportunity of testing it for themselves.

SEEDLING GRAPES will generally bear fruit the third year—sometimes the second—sometimes not at all. If our friends plant seeds now, taken fresh from the grape, they will germinate in a few weeks and make plants a foot or more high by next spring, when they may be thumped out of the pots and set in the soil where they are to remain.

ALFALFA TROUBLED BY DODDER.—Alfalfa does well in California as a forage plant, and is much liked where it has been tried—in Kansas and neighboring States. Farmers are cautioned about selecting the seed, as much of it in Europe and California contains seeds of a kind of parasitic vine or dodder called Cuscuta racemosa. This vine is a great pest.

CUTTINGS of grape-vines may be taken now and either planted in the open ground in rich, mellow soil, six inches apart, and covered with leaves or some other protection, or they may be buried in a dry place and then planted in the spring. There is no reason why every farm or garden should not have grape-vines. Those who are too poor or too mean to buy vines may procure cuttings from their neighbors.

THE Weekly Tribune, referring to exhaustive cropping, year after year, without rotation, without Sabbath rest of land, without even utilizing natural resources of manure, says that it is little less than pitiful to him who looks on rich soil as one of the best of God's temporal good gifts to men. It is not legitimate farming—it is land-slaughter in the first degree, and a crying injustice to succeeding generations.

EAST and west, men of experience and sound sense denounce the practice of selling grapes before they are fully ripe, a practice which is the abortive offspring of avarice and improvidence—of avarice, because the greed for petty gain gives birth to it; of improvidence, because a lack of foresight prevents those who are guilty of it, from seeing that thereby they are permanently injuring their own business by producing with their immature fruit a popular distaste for their wares.

MR. T. B. MINER devoted many years of his life to seedling-grape culture. Out of some 15,000 seedlings he produced, less than a dozen were selected by him as worthy of general cultivation, but several of these he believed would be accepted as improvements upon any previously known. A few months before his death, these varieties were sent to us for trial. We are glad to be able to say that they have made a strong, healthy growth, and we hope they may prove of sufficient merit to justify Mr. Miner's opinion of them, and that they will serve for all time to come, to keep his memory green in the minds of those, who, having labored in the same field, can appreciate the slight reward that generally attends original research in the world of horticulture.

THERE is a good deal of disquiet at present among extensive vineyardists in California and elsewhere at the prospect of a new reciprocal treaty with France, which would permit the free importation of French wines into this country. It seems hardly fair that while our manufacturers are guarded from foreign competition in our home markets by a protective and, in some cases, a prohibitory tariff, so important a branch of husbandry as viticulture should be exposed to ruin by the removal of the present duties on foreign wines. This would be a poor reward for the labor and research which have produced our present excellent varieties of Grapes which promise within the next five years to yield in California alone 50,000,000 gallons of first-class wine instead of the 10,000,000 gallons there produced yearly at present.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

ORNAMENTAL AND USEFUL.

No. 1.—PORTFOLIO FOR MUSIC.—For the foundation, cut two pieces of cardboard, 13 inches in breadth and 16 inches in length; cover these with gray cashmere, embroidered with any simple border in silk. The cashmere must be cut 20 inches wide and 31 inches long, and pointed at one end; this forms the outer cover for the two pieces of card and the fold over the pocket. A piece of cashmere, two inches wide at the top, and gradually sloping to one inch, is sewn to the outer card; and another piece of embroidered cashmere of the same size as the card, is sewn to this, to form a pocket. The fold-over, which is cut in the same piece as the cover for the cardboard, buttons over this. The two cardboard leaves are tied together with ribbon at the sides, and handles of ribbon are sewn to each leaf at the top.

Fig. 3.

NOS. 2 AND 3.—SHAVING TIDY.—This useful article may be easily made, and will form a nice present for a gentleman.

The outside of the case may be either of velvet or cloth, measuring sixteen inches long and six inches wide, embroidered with silk of two shades, in a pretty design round the edge, and a monogram in the center of one side. The case is lined with silk, and has two pieces of soft linen, edged with fringe; small squares of silk paper are tacked to the center, so that they may be easily pulled out after the razor has been wiped.

The case is folded in half, and a silk cord and tassels are sewn to the center of each side. Instead of embroidering the edge, narrow lace may be sewn on, if preferred.

Fig. 5.

No. 4.—PEN-WIPER.—Break the legs off a Dutch doll measuring four inches in hight. Sew tightly round the waist several petticoats of soft black cloth, pinked at the edges, each petticoat measuring two and one-half inches in depth. Make a skirt of dark gray cloth of the same length. The cape and hood are cut from a square of the same cloth, rounded at one corner, to form the back of the cape the opposite corner is first rounded at the point, and formed into a hood by running it across about an inch from the edge. Sew the hood under the chin to fasten it, and draw each side a little back from the ears, so that a point may be drawn up at the back of the head. A girdle of cord is tied round the waist to complete the friar's dress.

NOS. 5 AND 8.—WALL-BASKET FOR CLOTHES-BRUSHES.—The foundation of the basket is of bamboo, with panels of leather, colored or silver canvas, embroidered with claret chenille and blue silk as shown in design No. 8. The basket is lined with claret cashmere and ornamented with bows of blue satin ribbon.

NOS. 6 AND 7.—NEEDLE-BOOK.—The foundation for the needle-book is of card-board, measuring 3¼ inches in the longest and 2⅛ inches in the widest part; cut to the shape shown in No. 7. The card is covered with pale blue silk, with an *appliqué* of dark blue silk embroidered, as shown in No. 6, and fixed by a row of herring-bone stitches. The covers are bound with narrow ribbon and sewn together at the bottom. Two or three leaves of white blue cashmere are fixed inside, and the book is tied with ribbon.

NOS. 9 AND 10.—WORK-BAG.—The bottom of the bag may be made either of straw plait or braid interlaced as shown in No. 10. A bag of blue silk is sewn inside the foundation, and is drawn together at the top with silk cord and tassels. It is ornamented at the sides and bottom with bows of blue ribbon.

Fig. 2.

No. 11.—PINCUSHION.—The pincushion is in the form of a rabbit on a moss mat. The rabbit is made of a rough woolen cloth. It is cut in two pieces, and must be neatly joined down the back and filled with bran. The ears are cut in double material, folded in one pleat, and sewn neatly to the head. Two black beads serve for eyes, and a few stitches of red wool for the mouth. The mat is made by turning shaded green wool over a card, cutting it at one end as if for fringe, and sewing it to a circle of cloth, which must afterwards be sewn to a cardboard foundation. The rabbit is fixed to the mat by a needle and strong thread.

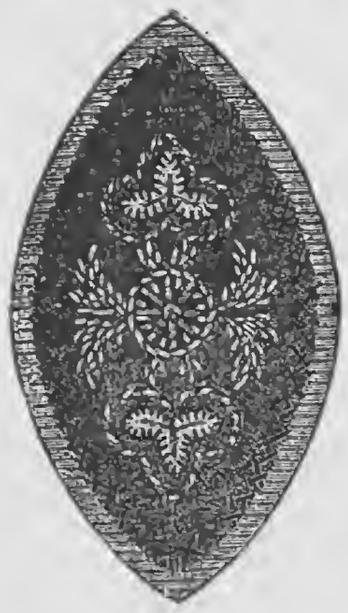

Fig. 6.

12—A FANCY BASKET.—A bag of crimson silk or cashmere is sewn on the inside of the basket, drawn together with cord and tassels. The sides are ornamented with bows of silk.

13—A PINCUSHION.—This graceful little design is a great improvement on the regulation cushion. The table may be of wood, bamboo, or metal, and the under-side of the cushion is made fast to it by means of tacks or glue. The cushion can be made of silk or cashmere, embroidered in contrasting colors, with a fringe of silk at the edges, or bright-colored silesia or cambric is pretty, with a cover made of white Swiss trimmed with Smyrna or Italian lace, and a box-pleated border edged with lace, around the sides.

Literary Miscellany.

OUR NEW SERIAL.

WE give this week the opening chapters of "Weaker Than a Woman." This is a story of domestic life, and while there is no lack of interesting incidents and dramatic situations, there is nothing in it approaching vulgar sensationalism. Its moral tone is exceptionally pure, the author not having followed the fashion of the hour, and introduced questionable love affairs to enhance (?) the interest of the tale.

The popularity of "Cora" (the last serial), and the numberless requests for another continued story, lead us to believe that the fortunes of the beautiful but unstable heroine and her handsome, noble-hearted lover, as narrated in "Weaker Than a Woman," will be followed by our many thousand readers with an interest not inferior to that inspired by "Cora."

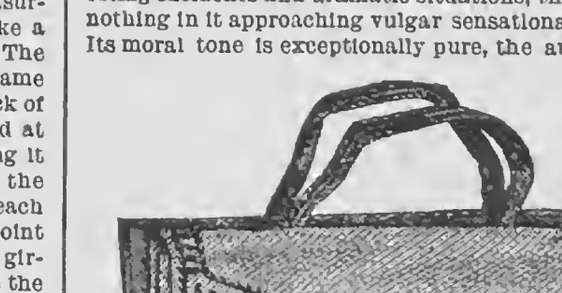

Fig. 1.

WEAKER THAN A WOMAN.

CHAPTER I.

"IT is true, Kate—every word of it. I was, like you, incredulous at first, but I heard the will read, and I assure you that Mrs. Hardman has left me six thousand pounds."

"I cannot believe it, Darcy. See how my hands tremble! I have hardly the strength to speak. It is impossible. Six thousand pounds! Oh Darcy, if there should be any mistake, let me know it at once, before I begin to found any hopes upon such good fortune—before I take it into my heart of hearts as a truth."

"My dear Kate, there is no mistake—there can be no mistake. I should not have told you had there been the least probability of such a thing. The money is our own, and will be paid to us when the estate is settled."

"Six thousand pounds! Why, Darcy, that means three hundred a year, does it not?"

"Certainly," replied Darcy Lonsdale, "properly invested."

Fig. 7.

"And three hundred a year means freedom from anxiety, from the constant toil of trying to make both ends meet. It means a larger and better house, a governess for the children. Oh, Darcy, how can we be thankful enough?"

"My dear Kate," said the lawyer simply, "I assure you that for some time after I heard it I did not know how I felt. The most pleasant part of it was coming home to tell you. I knew how delighted you would be."

"Have you told Felix?" asked the anxious wife.

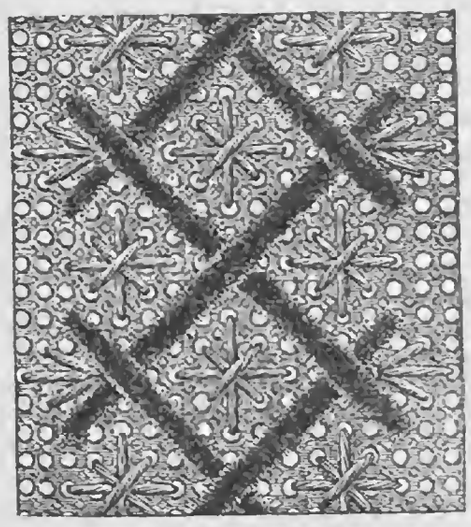

Fig. 8.

"No; I have not seen him yet. He is gone over to Nuncombe. He will be pleased. I can take him into partnership now, which is a thing that I have long wished to do. We have had a hard struggle together, Kate, but it is almost over now I should not have believed that money could make such a difference in any one's sensations. Yesterday I felt that the world was my master; to-day I feel that I have mastered the world."

"We shall be able to go to the sea-side now, and you can take a rest occasionally: and we can get some good port wine for little Nellie."

The lawyer smiled.

Fig. 4.

"And my bonnie Kate shall have a superb dress," he said—"one that shall make her look young and beautiful to others as she does to me. In truth, Kate, I see no end to the relief, the ease, the happiness, that this unlooked-for legacy gives us."

"We must take Vale House; it is to be let," remarked Mrs. Lonsdale. It is just such a house as I have always longed for; it is so large, so convenient, and has a much better drawing-room than that of the Newtons. What do you think, Darcy?"

Fig. 9.

"Yes; I think we might take Vale House. I will go out to-day, and inquire about the rent, rates and taxes."

"What will Mrs. Morton say?" mused Mrs. Lonsdale.

"Never mind about that," replied the lawyer. "All that we have to do is to enjoy our good fortune. I really do not know, but I think that such a sum of money never made people so happy before. Kiss me, Kate, and we will not forget to thank heaven together."

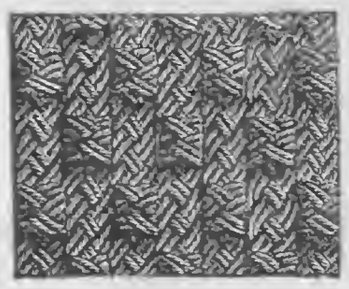

Fig. 10.

The speakers were Darcy Lonsdale and his wife. Darcy Lonsdale was the principal lawyer in the clean and well-built town of Lilford in Loomshire—a man who had had a hard hand-to-hand struggle with the world. He had been twice married. His first wife died in her twentieth year, leaving an only son, Felix; and ten years afterwards the lawyer married again. His second wife was a blithe, bonnie, rosy girl who loved him with all her heart, and thought no one in the wide world so clever, so great or so good. For his sake she took little Felix to her heart, and loved the dark-haired handsome boy as much as she did her own children. The lawyer's one drawback was his large family; nearly every year a pretty, rosy, smiling baby appeared, until, as he pleasantly declared, he had ceased to count them, for their

Fig. 11.

number frightened him. The "small army," he called them; and, though he was proud of them and fond of them, though he would not have missed one fair head from the circle for the whole world, yet the number told upon him—he could not save money, he could not even buy a house, his ingenuity was taxed to make both ends meet. The bills were so numerous—little feet must be shod, little fair heads must be covered, little minds trained; and nothing could be done without money. Still Darcy Lonsdale was a very happy man; he had a charming wife, beautiful children, a good practice, and he liked work. The one pride of his life was his tall, handsome son Felix, in whom the honest, simple-hearted lawyer had concentrated all his hopes and ambition. The "small army" were all under twelve, so that he could not build any hopes on them at present.

His life had on the whole been a pleasant one; but he did wish at times that he had a little more money. His practice was a good one; still it could hardly be called lucrative in the small pleasant town of Lilford. There was not much to occupy a lawyer; the setting forth and renewal of leases, the drawing up of title-deeds, the making of wills, the framing of agreements, composed almost the whole of his business.

Amongst his clients was an eccentric widow lady named Martha Hardman, [and Darcy Lons-

dale had for twenty years been her faithful friend, adviser, and guide. She said to him laughingly one day—

"You will have something to thank me for when I am dead."

"How can I thank you when you are dead?" he asked.

She nodded her head gravely.

"You will see," she replied. "You have done everything for me since you began to practice; but I shall not let you make my will. Tell me whom you would advise me to send for to do so?"

Thinking that she was in a capricious mood, he answered—

"Send for George Malcolm; he is an honest lawyer and an honest man. But why not let me make your will, Mrs. Hardman?"

"Because I am going to leave you something in it; and I have not read of the glorious uncertainties of the English law for so many years without wishing to be on the safe side. I may fail, but I will take all reasonable precautions."

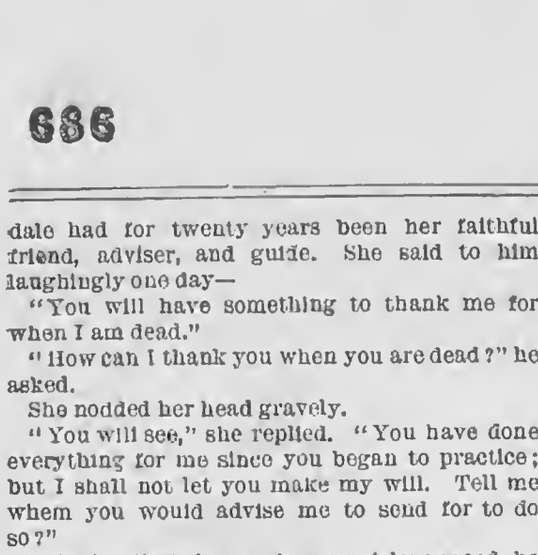

Fig. 12.

He laughed at the time, giving little heed to what she said, and soon afterwards he forgot all about the incident. Three years later Mrs. Hardman died, and her nephew, her heir-at-law, came upon the scene. Darcy Lonsdale had all her papers, an exact list of all her moneys, her deeds, leases, documents of various kinds—but he had no will.

"Did she make a will?" asked the heir-at-law.

"I cannot tell," replied Darcy Lonsdale. "I have certainly drawn up no will for her."

"Has she ever mentioned a will?" pursued James Hardman.

Suddenly the lawyer remembered that she had mentioned a will, and his face flushed as he thought of the conversation. James Hardman looked at him suspiciously.

"She did speak of her will to me once; she told me that I should not draw it up for her, and asked me to name some lawyer. I told her that George Malcolm was an honest lawyer and an honest man; but I never heard whether she sent for him or not."

"You know, of course, of what her property consists, and that I am her heir-at-law."

"Yes," was the cheerful reply; "we have often talked about you. I can give you the particulars of the late Mrs. Hardman's property. She owned the estate called Woodburn, consisting of a large farm and a good substantial house; and she had, besides this, twelve thousand pounds in the funds."

"And that is, of course, mine?" said James Hardman.

"I knew nothing as to that," replied Darcy Lonsdale. "I did not make her will, nor did she ever ask my advice about it."

After the funeral George Malcolm came with the will and the instructions that he had received from Mrs. Hardman. It was read aloud; and then it was discovered that the lady had left Woodburn together with six thousand pounds to her nephew, James Hardman, while to her true friend and adviser Darcy Lonsdale, in acknowledgment of his long friendship and faithful services, she had bequeathed the sum of six thousand pounds.

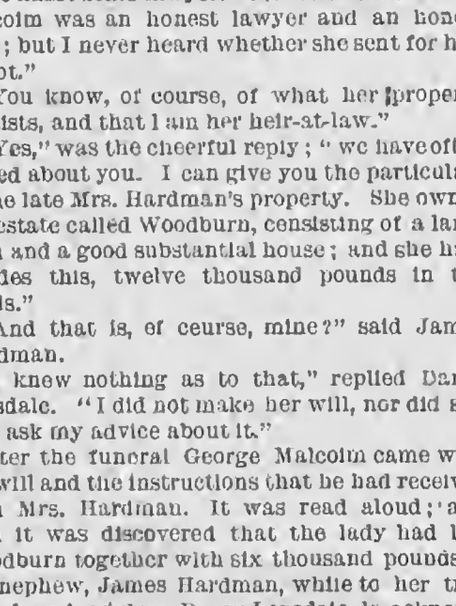

Fig. 13.

On hearing that, the lawyer hurried home, delighted with the intelligence, to his wife. What a vista of comfort this legacy opened! For the first time in his long and honorable career the lawyer felt some relief—he could meet his expenses now, and when he died there would be something for his wife and children.

Nor was his wife less delighted. In her heart she had longed for the same luxuries that the wives of other professional men enjoyed—for a drawing-room like Mrs. Merten's, for a nursery-governess such as the Doctor's wife, Mrs. Daiverly, had engaged, for a silk dress like the one that the Rector's wife wore. But of these desires she had never spoken. She knew that her husband did his best in every possible way, and gave her all the money that he could. But now she ventured for the first time to indulge in such blissful reveries. They were no longer idle dreams; they would be realized. She would live in Vale House, that delightful residence—she would have a charming drawing-room, a nursery-governess, and a costly silk dress.

While she sat dreaming with a smile on her face, her step-son Felix entered the room. There was the warmest attachment between these two—kindly liking and respect for his step-mother on his part, the highest admiration and the truest love for her step-son on hers. She was so young when Darcy Lonsdale brought her to the great white square house in Castle Street, Lilford, that it seemed absurd for Felix to call her mother. As he grew older it appeared to him that, with her soft Italian beauty, the most suitable title for her was *madre*. He looked at her now.

"*Madre*," he said, "you are looking very pleased and bright; what is the good news?"

Mrs. Lonsdale went up to him and clasped her arms round his neck. She drew the handsome face down to hers.

"Kiss me, Felix," she said; "I have news to tell you—the best you have ever heard. I know you will be pleased—indeed the very thought of the news makes me tremble with joy. You could never guess it, Felix."

"I suppose I never could. Have any of the 'small army' distinguished themselves?"

"No; it is nothing of that kind. It is this. You remember Mrs. Hardman of Woodburn?"

"I should remember her, *madre*; some of the dreariest hours of my life have been spent in copying deeds bearing her name."

"My dear Felix, her name must be held blessed amongst us for evermore. She has left your father a legacy of six thousand pounds—and to us, my dear, that means so much. It means Vale House to live in, a governess for the children, and a partnership for you."

His handsome face flushed hotly.

"And that, *madre*—that means for me Violet Haye."

A tender light came into Kate Lonsdale's clear eyes.

"I hope so," she said gently; "I shall be so pleased if it is so. Now, Felix, people call money dross. Could you or I estimate the amount of happiness that lies in six thousand pounds?"

"I value it because it will give me Violet," declared the ardent young lover.

"And I because it will give me every desire of my heart," said Mrs. Lonsdale. "And, above all, it will give your dear father a little rest."

CHAPTER II.

Violet Haye! There is something in a name. More than one man murmured this one over and over again, wondering to himself what sweet magic, what wonderful sorcery lay in it. Violet Haye—the very sound evoked a vision so beautiful, so full of witching grace, so dainty, so delightful, that dwelling on it proved too much for minds and brains not over strong. What had not Violet Haye to answer for? How many prosperous young farmers had wasted the best hours of the summer days, while the hay spoiled in the meadows and the corn grew over-ripe in the fields, watching in Castle Street, or waiting in the green lanes, for one glance at the peerless face of Violet Haye? The young doctor who had bought the old physician's practice had almost gone mad for love of her; and, when she told him, with a sweet, bright smile, that she disliked medicine and everything connected with it, in pique and despair he married a prim little old maid who had ceased for fifteen years to dream of a wedding ring. Young curates came, saw, and were conquered; but beautiful Violet resolutely refused to help in any parish work—she would have nothing to do with the schools. One after another the curates went away, with a bitter memory of one of the loveliest girls in Loamshire. The young tradesmen of the place had never dared to lift their eyes to her, for she belonged to the class known in Lilford as the gentry; but when by chance Violet Haye did enter a shop the master of it had need of patience during the next twenty-four hours, for Violet Haye was a most beautiful girl, and reigned queen of the country round Lilford.

There was a wonderful charm about the girl. It was not simply for the sheen of her golden hair, for the wonderful light of her violet eyes, the exquisite tints of her face, the beauty of her rosebud mouth, that men loved her so; it was not that she was tall and slender, with a perfect figure; it was not that she had white hands that wove wondrous spells, that she moved with grace that was all harmony, that she spoke with a voice sweeter than sweet music, that, when she laughed, the silvery chime stirred a man's heart like the sound of silver bells; it was not for this that men loved her. She was not a flirt, not a coquette—she never, by word or look, made any man believe that she loved him; but she could no more have helped the way she had of charming men than she could have helped living. She was the only child of Francis and Margaret Haye, who lived in a pretty villa called the Limes, on the outskirts of Lilford. By kind indulgence the Hayes were permitted to rank with the gentry. They were not poor; they were not "professionals;" they were not in trade. Francis Haye had an income that kept his family in comfort, but it would cease at his death. He had insured his life for the benefit of his wife and child, and the money that would come to them from that insurance was all that he had to leave them; still they belonged to the gentry. It was not a numerous class in Lilford, and was by no means to be identified with county society; that was a far-off and greater glory—a world that even beautiful Violet with her Greuze-like face had never hoped to enter. The gentry comprised old Colonel Maddox and his lady; Mrs. Brownson, a widow lady with a daughter of uncertain age; the late Rector's widow, Mrs. Boulders; a maiden lady Miss Stanley, the pride of whose life was that her second cousin had married a baronet, and who, in consequence, piqued herself on her high connections, and talked in a familiar way of the aristocracy; and a few others of the same calibre. It was not a brilliant circle, but to Violet Haye it was a world.

If of her numerous lovers she preferred one, it was Felix Lonsdale. It was an old story. He had certainly been her lover from the early age of seven. He had never thought of any one else; to him and for him the world was all Violet. In the sun's rays shone Violet; the birds sang "Violet"; no sweet flower bloomed that was as sweet as she. He had lived with this one thought; he had studied, worked, toiled—all for Violet, hoping that the day would come when he would be able to marry her. He had devoted his life to this one object.

Darcy Lonsdale had contrived to send his son to Oxford, he had distinguished himself as a scholar of no mean abilities, after that he had passed some time in London; and now he was with his father, sharing his labors and toil, and working hard, hoping one day to secure a partnership, and then to marry Violet. He had once thought of leaving Lilford; he felt that the place was but small, the circle of interests limited. Then he put aside the thought as a temptation; he must not desert his father or leave his business to the hands of strangers. There was something almost heroic in the way in which he looked round upon the great bright glittering world, with its magnificent battle-fields of skill and intellect, its great arenas where mind and brain fought mind and brain, and then said to himself, "No, my duty lies at home, and I will work there."

He was singularly gifted, this young Englishman, who was brave enough to make duty his guide. People often looked at him in wonder, asking themselves whence had come his clear-cut face—a face of the purest type, with dark clustering hair that waved back from a low broad brow—his beautiful mouth, that could be rigid and firm, yet often wore a smile as sweet as a woman's; the dark eyes that were as true and eloquent as the soul they revealed. It was a poetical face, yet combining with the intellectual and the ideal something of the practical keenness of a clever man.

Darcy Lonsdale formed great hopes for his son; he had rightly estimated his abilities, and he had said to himself that in time the best business of the country would be brought to him. He himself was industrious, honest, and in some degree a good lawyer; but his son was a genius, and the father told himself with a sigh that in these days a touch of genius was needed before one could make a mark in the world.

As boy, youth, and man Felix had loved Violet Haye—to win her, to make her his wife, had been the one dream of his life. He had had no other; and it was equally certain that up to the present time his love had brought him far more pain than pleasure, far more torment than rest, far more strife than peace. He could never tell whether beautiful Violet cared for him or not—all the country-side knew that he loved her. It seemed to him that the very birds in the trees and the flowers in the hedges knew that. It had never been a secret; but he could not guess whether she cared for him. If ever he felt hopeful and augured much from a kinder word or a sweeter smile than usual, the next time she saw him Violet would be cold. She was so proud that he could hardly extort a word from her; and yet he had a dim idea, a faint conviction, that she preferred him to any other.

Now was his opportunity. He was already making a fair income by writing reviews and essays. If his father took him into partnership, his share, though perhaps small at first, would be certain, and would increase. Now was his opportunity; he would delay no longer, but would at once ask Violet Haye to be his wife.

"It seems almost too good to be true," he thought to himself, "that I should succeed in my profession, that I should win the girl I love for my wife, that I should be happy and blessed. What have I done to deserve it?" He looked up to the sunlit skies. "Done," he repeated—"I have done nothing. It is the goodness of Heaven that has given it to me. Heaven grants all to industry," he thought, "and while I work I need not fear."

In that hour no thought came to him of the storm clouds that darken men's lives—of the terrible tempests that rend heart and brain—of the despair that looks for death as relief. He saw only the blue sky and the golden sunshine.

He saw nothing but the beauty of the fair earth and the laughing sky when he went to woo beautiful Violet Haye and asked her to be his wife. He had been waiting only until he saw a prospect clear and bright before him. Francis Haye might have objected to a man with an uncertain future; Francis Haye would not object to the junior partner of the old-established house of Lonsdale. He was only twenty-four, and, after selecting a very choice flower for his coat, was to be forgiven, if he looked once at his clear-cut face and dark moustache. As he quitted his father's house on that lovely summer afternoon there was perhaps not a handsomer, truer, more noble or gallant young lover in all broad England than Felix Lonsdale.

"Wish me good fortune, *madre*," he said, bending down to kiss Kate Lonsdale's kindly face—"I am going to the Limes."

Kate loooked up with a smile. She made no answer. She kissed him as his own mother would have done, and watched him as he walked down the street.

"There is no need to wish him good fortune," she said to herself; "the girl does not live who would say 'No' to him."

As she went through her round of duties, Mrs. Lonsdale thought often and anxiously that she would like to know how Felix was speeding in his wooing.

CHAPTER III.

It was a glorious afternoon. The country about Lilford was beautiful in the extreme, with lovely undulating meadows, great chains of green hills that stretched into the far distance, dark, shady woods, with some of the finest trees in England, lovely green lanes where wild-flowers raised their bright heads. The town itself was quaint and picturesque; the pretty, old-fashioned houses were almost buried in foliage. The one long main street of the town—Castle Street—might have been a Parisian Boulevard, it was so regularly planted with trees.

This afternoon seemed to Felix Lonsdale one of the fairest that he ever remembered. He walked through the clover meadows, his heart singing for joy, snatches of song rising to his lips. The hedges were all pink and white with hawthorn, long sprays of woodbine twined round the rugged trunks of the tall trees, the clover was thick and odorous. He crossed the path at the end of Oakwoods, where he saw most glorious vistas of light and shade, entered a long, green lane, and then he reached the fair green fields that led to the Limes, the home of his love.

Presently he saw Violet Haye. He gazed at her in mute wonder that earth should hold anything so fair. She carried a little basket filled with flowers, and on her golden head she wore a simple garden hat. Her dress seemed to him a wonderful combination of white and blue. A feeling of humility came over him—who was he that he should hope to win this brilliant young beauty and make her his own? Then his pride reasserted itself; his love ennobled him, he could hope to win her because he loved her so dearly. Violet did not see him. She was walking in the other direction, and he hastened after her.

It was no wonder that he loved her; the smiles with which she greeted him would have turned many a wiser brain than his.

"Felix," she cried, "I did not dream of seeing you."

"And seeing you, Violet, is like a dream," he replied, "and after I have left you I think of a hundred things that I wanted to say to you, meant to say, and yet forgot."

"That proves that you have a bad memory, Felix," laughed Violet; "but what has brought you to the Limes on this warm afternoon?"

"I have come to see you, Violet."

"I ought to be much obliged to you," she replied; "but the afternoon is a very busy time with me. I attend to all these flowers myself."

"I will help you with the flowers, and I hope that I shall be no obstacle to your pleasant thoughts, Violet," he said.

They walked together until they reached an opening in the lawn; there was a bank gay with wild-flowers, a hedge full of wild roses, and hawthorns crowned it. Felix took the basket from her hand and placed her on the bank.

"I have come to talk to you, Violet," he said. "You must forget your flowers for a few minutes and listen to me. Such a day as this, Violet, was made for a love-story. I have an idea that everything in nature is interested in mine."

"Your ideas are not of the ordinary kind," she remarked.

"No, they are not, I own. Still they please me, Violet. I have a sweet fancy. Shakspere says all sweet fancies come to lovers."

"But we are not lovers, Felix," she said, gravely.

"Then I hope we soon shall be. I have a fancy, Violet, that every bird singing in the trees knows why I am here, that the flowers and the sunshine knew it."

"Then," observed Violet, "they are wiser than I."

"No, not wiser or sweeter or brighter than you; but it was an idle, pretty fancy, Violet. As I walked under the great shady trees every leaf seemed to stir—as I passed, the roses in the hedges nodded; they said, 'The sun shines and the earth is fair; now is the time for youth and love.'"

Violet looked up at him with a resigned little sigh.

"Not being either a bird or a flower, I am not in their confidence, Felix; and perhaps when you have finished with them you will tell me what you have to say."

"I will tell you now. I have such good news, Violet. Mrs. Hardman, one of my father's clients, has left him six thousand pounds."

Violet's violet eyes opened wide in wonder.

"Six thousand pounds! That is a great deal of money, is it not, Felix?"

"Yes, a very great deal. You knew my father has an excellent business, but he did certainly want a little more money. This legacy has made him happier than I can tell you."

"I should not think that money would make any one happy," said Violet, thoughtfully.

"No, it would not. Never hold with that idea, Violet. But this is the important thing—my father will now give me a partnership. My darling, do you understand—a partnership?"

"Yes, Felix—what then?"

"I have one hundred a year that my dear mother left me; I make quite another by reviews and articles for legal papers—that makes two hundred; then from the business I am sure to obtain at least three hundred more—that will give me five hundred a year, Violet; and, my darling, there is a beautiful little cottage *orne* near Oakwoods; and, oh, Violet, Violet, will you be my wife? My darling, you know how long and how faithfully I have loved you. I have come to-day to ask you to be my wife."

Her white hands dropped listlessly; she turned her face to his; no warm flush covered it, no love-light shone in the violet eyes.

"How cruel of you," she said, in soft, lingering tones—"how very cruel on this sunny day to ask me such a question!"

There was no anger in her face, no annoyance—nor was there pleasure or happiness: she looked rather like a child who had been disturbed at play. He was neither anxious nor dismayed, for he understood the expression on her face well.

"Why is it cruel, Violet?" he asked.

"It is cruel. You know I do not want to be married, Felix. I do not like to be teased about love."

"But, my darling, no one can look at you and not love you."

"That is not my fault. And, Felix, you should not call me 'darling'; do you not know that is hardly proper?"

"If I knew a word that conveyed more, and sounded more sweetly, I should use it," he said, looking with passionate admiration at the pure, perfect face. "Oh, Violet, do accept me! No one else in the wide world loves you half so much. I would make you so happy that you would never regret it."

"I am very happy now," she murmured plaintively.

"That little cottage *orne* is so pretty, Violet. There is a little drawing-room that opens on to a flower-garden — imagine that all furnished in white and gold; then there is a little room upstairs I should furnish as a budoir for you—a room that would be a fitting shrine for my pearl of pearls. My darling, you should have everything that your heart desires."

She touched her face gently with her dainty hands.

"You would buy the moon for me if I wanted it and you could obtain it," she said laughingly. "But, Felix, I do not want the moon, and I do not want to be married. Do talk of something more pleasant."

"Violet, my heart is so full of this; it seemed to me as I came along that I walked on air. I have loved you so long; I have no life apart from you; and I have been waiting so impatiently until I could see a chance of making a beautiful home for you. Now I see it—do not be cruel to me, Violet, I implore you."

"It is you who are cruel to shadow this fair day by talking of love and marriage, Felix."

The words sounded harsh and cold, but there was no coldness on her fair face.

"You know that I have loved you, Violet, ever since we were children."

"Yes, I know it. I should know it—you tell me so every day."

"And you—you have had admirers of every kind, I believe, dark and fair, tall and short; but, Violet, you love me best, do you not?"

The lovely face drooped over a bunch of wild thyme. She did not answer; but he persisted in his questioning.

"You love me best, do you not? Oh, my darling, be a little kind to me!"

There was such passionate love in his handsome eyes, such passionate pain in his face, that she was touched.

"Yes, I do love you, Felix," she said gently; and then she looked up in alarm. He had clasped her hands in his and covered them with kisses; his dark eyes were dim with tears.

"Oh, my love," he cried, "you hold my heart in the hollow of your hand! If you had said you did not love me, the words would have killed me as surely as ever a man was slain. My darling, do you not see that if you love me you must of necessity be my wife? You must of necessity be my wife," repeated Felix, "or what is the use of love?"

"It is pleasant," she replied: "still, marriage—well, Felix, you will laugh if I tell you that it seems to me like calling a child into a gloomy house from sunshine and from play."

"That is not a pleasant comparison, Violet, my darling," he remarked, smiling, "you will be very happy. Now you spend your life amongst all sorts of pretty things. You shall do the same then. No shadow of care shall come near you. You shall be one of the most worshipped as you will be one of the most beautiful of wives."

"But, Felix," she said slowly, with an air of perplexity on her beautiful face, "it seems to me that marriage is the end of everything. Once married, there is nothing for one to look forward to, nothing, as it were, to hope for; it is the beginning of a dull, gray, monotonous stretch of life."

"You will not always say so, Violet." Felix laughed. "You must marry—you love me. Promise to marry me."

She was looking away beyond the green trees, as though she were trying to peer into some far-off future.

"I do love you," she returned thoughtfully—"I am sure that I love you—but there seems to be something more wanting. I cannot think this is all that life holds for me; yet I cannot tell what it is I want."

"You love me," said Felix. "I am quite content. The rest is nothing but the natural fear that a young girl has of a new life. Tell me again—my heart hungers for the words—that you love me, Violet."

Slowly she turned her eyes from the distant hills; slowly she raised them to her lover's face. Love him? Certainly she did. His ardent young face had some of the proud, stern beauty that immortalised the Greek heroes. There was none like him in Lilford. Certainly she loved him very much. Why hesitate to say so? She spoke slowly, in a sweet clear voice.

"Most surely, Felix, I love you"—and the words seemed to fill him with delight. He took the soft white hands in his, and held them while he made her repeat again and again that she loved him.

"You can never go back from your word, Violet. No human ears to hear us; but behold the great broad blue sky. Your vow is made to me, darling, before Heaven."

"I have made no vow, Felix."

"You have said that you love me. Violet, make me quite happy now. Already I am so happy that the air seems to intoxicate me. Say you will be my wife."

She was thinking again, with the same far-off look in her eyes, and she said suddenly—

"A cottage *orne*. Do you mean that pretty villa where the Hendersons stayed?"—[To be continued.

SEPTEMBER IN CHINA.

E. F. MOSBY.

The Chinese in the city of Canton have a very delightful time during the month of September. It is then that they celebrate the Feast of Lanterns in honor of the Harvest-Moon, whose birth they rejoice over.

On the night when the September moon is full, each Chinese householder has to suspend from the highest point of his house at least two lamps, and all day they are busy preparing and painting in gay colors the lanterns, which are of all sizes and hues, and are made in very curious and grotesque shapes. They fasten them on the points of long, slender bamboos, until the roofs of the houses look more like a canebrake in the South, or a bank of reeds by the side of a river, than a city.

But as night comes on, and the moon rises slowly in the lovely deep-blue sky of the East, all that is queer or ugly disappears in the faint shadows, and the colored lights in the air begin to shine. All the great city, with its many low, mean-looking houses, is suddenly transformed into a scene of sparkling, gleaming, twinkling beauty, like an Aladdin's garden, with fruits of gems and precious stones, hung by a magic spell, high over our heads.

On the river below are numbers of little boats, some full of flowers, some having refreshments for sale, or public entertainments and shows or plays on board, all brilliantly illuminated; in some cases with rows of colored lanterns in every imaginable device, but always gay, and moving here and there like troops of fire-flies. Nor are the lanterns over head still, for the bamboos are not only stirred by every light wind, but are swung to and fro by the weight of the colored lamps themselves, and the roofs are so close together, that they seem like great beds of flowers of light moving in the breeze.

The people in the flower-boats on the water send off a continual stream of rockets, like a fiery rain as they dart down, after flashing far up towards the clear blue heavens, and are reflected again in the dark waves underneath, that seem to sparkle and shine too. From every house, as well as from the floating crowds of tiny vessels, comes an explosion of fire-crackers—very like a Fourth of July in Philadelphia—only these are more elegant, as they are made fragrant by fine shavings of scented wood, which perfume the air as they burn. Far off near the outside walls of the city, the noise seems to die away into a softer hum, and the flash and sparkle of the fire-works into a dim red glow.

The Chinese have no bands of musicians with instruments like ours, but they have an instrument that is called a gittern, which makes a tinkling sound like the falling of drops from a fountain into a marble basin, and cymbals and gongs, whose clash and clang mingle with this, not inharmoniously—if one is very far off.

Canton is a sea-port, and among the Chinese you see crowds from other countries, people from England and the United States, traders who come to buy tea and silks and shawls and porcelain and carved ivory. From the vessels all the flags of the different lands from which they come are flying, and the most beautiful and brightest of these is our flag of the Stars and Stripes, to which the Chinese give the pretty name of the "Flower-Flag" on account of its pure white and tender blue and gay red colors, like a glowing mass of garden blossoms.

I can imagine the pure, pale moon, as it rises higher and higher in the quiet sky with its rich depths of purplish-blue, looking down as if surprised at noises and the glitter and movement below; the grotesque houses, and singular, oblique-eyed people who prefer their noisy festival and glaring illumination to the tranquil loveliness and stillness of the heavens overhead. But the same quiet Harvest-Moon shines down on far grander scenes, which surround this crowded city, and suggest very different thoughts,—on the shadowy hills, which as you see them from Canton, look like mountains seen in a dream—on the wide ocean and its solemn solitude, its rhythmic tides.

CHURCH FAIRS.

I have chosen to retain the old name at the head of this article rather than use the one which seems to be rapidly displacing it—to wit, Bazaar. Whether the latter be more appropriate, and if so, why, is a question that might be discussed with propriety, but I am not at present philologically inclined, so leaving it, I will proceed to consider the topic announced above.

This might also be an interesting question to investigate: When, where and by whom were church fairs invented, discovered, conceived, suggested or planned? What illogical mortal first dared to ask his neighbor to contribute articles for a fair, and then asked him to pay for the privilege of purchasing them at double their value? Who was so hopeful as to believe people in the full possession of their reason, would pay to be admitted to a room where they might buy ice-cream and oysters at a higher price than that for which they are sold at places where no admission fee is charged.

But somebody did have the audacity to try it, and, contrary to all rules of reason and common sense, it succeeded. Church fairs are permanently established as one of the institutions of the country. And am I going to urge objections to them? If I know myself I am not so unwise as that. There are some things in this world that, while they have few supporters who will not agree, if privately and confidentially interviewed, that they cost, all things considered, more than they are worth, cannot be publicly opposed by any one who has regard to his social status in the community where he resides. No, I do not intend to object to church fairs. I know the unanswerable argument always advanced by the ladies: "We couldn't raise the money in any other way;" and I admit its force.

Having thus broadly disclaimed any intention of objecting to church fairs as an institution, may I not be allowed to call attention to certain practices usually connected therewith, that seem to me unwise, injudicious and immoral. I refer particularly to the gambling carried on under the various disguises of chances, lotteries, grab-bags, and other similar devices.

I have seen a clergyman who preaches against the practice of playing cards for amusement, superintending in his own church the selling of chances and the raffling of the numbers when the list was full, while on a table near by a Bible was put up at lottery. It is fair to say, however, that this lottery was not drawn. That a Bible should be gambled for shocked the morals of some interested; so a cake was substituted for it with the understanding that to the fortunate holder of the number that drew the cake, the Bible should be presented. At this fair an anti-gambler who had declined the clergyman's solicitation to take a chance, made this proposition: That as many as pleased should put up five dollars each. Dice should be thrown in the usual way; he who threw the highest number should get in his money and the rest be paid into the church treasury. This was not considered for a moment. The dice were gamblers' implements and such a proceeding would be gambling. Many parents who would punish a child for playing marbles "for keeps," give them money to pay for chances in grab-bags, take a turn at a wheel of fortune or invest in "shares" for the "finest doll in the room." How little do they think they are giving lessons in wrong-doing, that may last a lifetime.

I will do the participants in lotteries at church fairs, particularly the ladies, the justice to admit they have never looked upon the matter in its true light. Usually some articles contributed are so valuable as to find no ready purchaser, and conscience is quieted, if indeed it has ever been disturbed, by the thought, "We can't dispose of it in any other way, and it is for the good of the church we are raising the money," forgetful of the injunction to do no evil that good may come. That gambling is an evil will be readily admitted. That all these practices are neither more nor less than gambling, will be apparent to any one who will give the matter a moment's serious thought. That they are unlawful in this and most of the other States is certain, although, perhaps, not generally known. For the information of managers of such schemes and that they may see to what penalties they expose themselves, we append extracts from the Statute Laws of New York:

"No person shall set up or propose any money, goods, chattels or things in action to be raffled for or to be distributed by lot or chance, to any person who shall have paid or contracted to pay any valuable consideration for the chance of obtaining such money, goods or things in action. Any person offending against this provision shall forfeit three times the sum of money or value of the articles so set up, together with the sum of ten dollars, to be recovered by or in the name of the Overseers of the Poor of the town where the offence was committed."

"No person, unauthorized by special laws for that purpose, shall, within this State, open, set on foot, carry on, promote or draw, publicly or privately, any lottery, game or device or chance, of any nature or kind whatsoever, or by whatever name it may be called, for the purpose of exposing, selling to sale, or disposing of any houses, lands, tenements or real estate, or any money, goods or things in action. Whoever offends against this provision shall be deemed guilty of a misdemeanor, and, on conviction, shall be subject to a fine equal to the amount of the whole sum or value, for which such lottery, game or device was made, and if such amount cannot be ascertained, then to a fine of Twenty-five Hundred Dollars, or to imprisonment not exceeding two years, or to both, in the discretion of the Court." L. A. R.

RECENT LITERATURE.

Sonia. A Russian Story. By Henry Greville. Translated from the French by Mary Neal Sherwood. Phila.: J. B. Peterson & Bro. Price 50 cents.

This is a very powerful Russian story, simple, while wonderfully impressive, and shows the author's intelligence, agreeable humor, ready wit, invention, and great power in the drawing of character. Sonia is a poor little Russian slave, knocked about and abused by the brutal aristocrats whom she serves, until a young tutor, Boris Ivanovitch, takes her under his protection. The great value of the work consists in the delicacy and originality with which the really beautiful character of the girl, Sonia, is developed. Sonia is a graceful, domestic story, displaying the author's ready invention, imaginative style and play of fancy, is careful in construction, and most charmingly and beautifully told—giving one a very distinct idea of every-day home life in Russia.

MAGAZINES.

Demorest's Magazine for November is full of just such things as most commend themselves to ladies. The "Kitchen" has a whole column devoted to candy-making; there are, besides, recipes for puddings and cakes, and a most entertaining article on the cabbages. Six stories, a letter on Etiquette by Jennie June, a sketch of Venice with illustrations, the correspondents' class, a useful contribution on Toilet Soap, a chat about home life, a report of What Women are Doing, besides fashion plates, cuts of modish garments, full and interesting descriptions of the latest styles in dress fabrics, jewelry, millinery, some pretty designs in fancy work; and all for 25 cts.

BRIC-A-BRAC.

A TIME-LY TOPIC.

What is it that's shouted, howled and sung
By every class, in every tongue,
By old and middle-aged and young?
Grandfather's Clock.

What is that I hear all day,
That's whistled from Dan to Beer-she-*ba*,
That every piano 's made to play?
Grandfather's Clock.

At night, what rouses me from bed?
At work, what starts my aching head?
At home, what's hummed by wife and maid?
Grandfather's Clock.

What *weights* for no one, *works* apace,
Confronts all *hands* with brazen *face*,
And *springs* at them from every place?
Grandfather's Clock.
[*Puck.*

A TINY thing—a fork.

A man dyes his gray head, when if he would but wait his gray head would die itself.

Suppose the women of this country should refuse to work over eight hours a day, what would man do for his supper?—*Philadelphia Chronicle-Herald.*

"Glass slippers" are announced. It is doubtful if the small boy finds as many panes in them as he has discovered in the old kind. "There's nothing like leather," after all.—*Norristown Herald.*

For of all sad words that ever were written,
The saddest are these, "I got the mitten."
[*Edenburg Herald.*

Caution and Love.—"Oh! Edwin, love, here's the announcement of our wedding. Listen!" (Reads)—"'On the 16th inst., at St. George's, Hanover Square, Edwin Goldmore Tomkyns, Esq., M. P., of Goldmore Park, Suffolk, and 248 Prince's Gate, to Lady Angelina, twelfth daughter of the Earl of Silverlake.'" "Read on, my own sweet love. There's another paragraph—in brackets, I think." "Oh! yes." (Reads on.) "'Mr. E. G. Tomkyns takes this opportunity to intimate that he will not be responsible for any debts contracted by his wife without his written authority.'"—*Punch.*

What was it that Thaddeus of Warsaw?—*Cincinnati Saturday Night.* What kind of grub was it that Henry VIII.?—*Wheeling Ledger.* What did Darwin?—*Kennebunk Star.* Whom did Gladstone?—*Bellair Phonograph.* What did Count Schouvaloff?—*Burlington Hawkeye.* Now, what did Hamlet?—*N. Y. Express.* What did William Tell? When did Bonaparte? Why did Marshal Ney? What did Theodore Hook? When did you Seymour? Upon what did Archbishop Trench and what did Captain Cook? Did Disraeli? What did William Penn? What did Bismarck? What did Leigh Hunt? When did they take Offenbach? Three or four hundred more crowded out for lack of room.—*Boston Transcript.*

Take it down tenderly,
Lift it with care,
Brush it and send early
To the talaire—
That old ulstaire
That you must wear.
U-g-g-h-h-h.
[*Whitehall Times.*

SOME EUROPEAN PRICES.

Col. Forney has been collecting some statistics with reference to the rates of wages paid at Brussels. He reports as follows:

Gentlemen's upper servants, $60 a year and boarding; coachman, $80; lady's maid, $40; house servants, $20 each year and found. The following get the sums opposite their trades, daily: Women lace-makers, 50 cents; tailoresses, 35 to 40 cents; washerwomen, 30 cents, and all find themselves. Machinists get $1; bricklayers and masons, 50 cents; cigar-makers, 30 cents; blacksmiths, 75 cents; locksmiths, 50 cents a day, and all find themselves.

Provisions are not very much cheaper there than they are now in the United States. Coffee, 30 to 80 cents a pound; rice, 10 cents; butter, 36 cents; sugar, 18 cents; eggs, 2 cents apiece; beef, pork, mutton and veal, which the poor rarely get, average about 25 cents a pound; ham, 45 cents a pound; bread by the pound from 5 to 6 cents.

H.

An old story used to go the rounds with "S" as the initial letter of each word. Here is an extract that will carry terror to an Englishman's heart:

Humphrey Hubbard had heard Hephzibah Huggins humming hymns hilariously, he having helped Hephzibah homeward. Humphrey hankered hugely, harboring handsome Hephzibah heartwise. He had high hawthorn hedges hiding his handsome house, harnessed horses hauling harrows, hoeing hilly hills, helping herdsmen, hewing hemlocks, hackling hemp, harvesting hops, hunting hawks hurting hatching hens. Hephzibah, helpful housekeeper, hemmed handkerchiefs, hoarded honey hitherto hived, heeled hose having holes, handled harpsichord harmoniously; happy Hephzibah! Her honest homely happiness hit Humphrey heavily. He hovered, handsomely habited, hinting humbly how Hephzibah had harried his heart. Hephzibah honored his hearty homage. Hating, however, haphazard haste, Hephzibah hung her head, halting, hemming, hawing, hoping Humphrey had harmless habits, hypocritical, hesitating Hephzibah! He held her hand hopefully, hungrily humoring her. Happily, Hephzibah heeded her hirsute hero. Hymen hitched Humphrey Hubbard-Hephzibah Higgins, he hugging her, happily hysterical! Henceforth husband helped housewife hop hornpipes, holding honeymoon holiday, hardly hearing harlequins howling hallelujahs, hailing house-warming. Ha! Ha! Ho! Ho!—*Philadelphia Bulletin.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

MOP HANDLE PAPERS, NO. 7.

MAY MAPLE.

CLEANING SILVER-WARE.

WHILE washing the dinner-dishes to-day, I noticed that the silver teaspoons were slightly discolored. So I took a bit of soft flannel, dampened and dipped it into some *white* ashes from the stove, smooth and soft as the finest flour, and rubbed the spoons, and they were brightened immediately, without a scratch. While thus employed my thoughts took a run backward to my childhood's days, when I was visiting a dear auntie who had recently taken upon her shoulders the responsibilities of housekeeping. During the busy season she kept a hired girl. Now, it so happened that Phebe was desirous of doing her work in the very best manner, that she might please her mistress. And it also happened that Phebe was all unused to the care of silver.

One morning while Auntie was in another part of the house, attending to work that required her immediate supervision, Phebe was left to clear away the breakfast service. The dishes were all properly washed, rinsed and put away. Then came the scouring of the knives with the Bath-brick dust—and rather coarse dust it was—and to have the work finished as she would need to do it at home, she must scour the spoons as well as the knives and forks—those new silver spoons that were as bright as mirrors. Only a part of the dozen was in use, for the family was not large; but faithful Phebe hunted the rest, and took them out of the soft, silken wrapping paper, and scoured the whole of Auntie's setting-out—large spoons, dessert spoons, tea spoons, and sugar shovel—all went through the scouring process. And all came out severely scratched, their mirror-like beauty spoiled. An hour or two later Aunt Hattie had occasion to use a spoon; and then, RURAL readers, you should have seen her beautiful blue eyes open wider and still more wide, as she beheld all her spoons handsomely arrayed upon the pantry shelves, and as quickly discovered the exhibition of home-marking. And, as "Topsy" would have said, "didn't Phebe catch it, though?" No doubt some matrons will say she deserved scolding, if she did not know better than that.

But Phebe was not so much to be blamed, as she might have been. If her mother had been a wise woman, she might have taught her. But very likely there was not a bit of silver in the house, and so the lesson did not seem necessary. Now, I do hope some of the young ladies who will at some time have homes to preside over, will read these home talks which I have named "Mop-Handle Papers;" and, possibly, they may be wiser and happier in the future for heeding their well-meant precepts.

At the present time there is a great deal of *plated* silver-ware sold about the country. It looks as well upon a well-arranged table as though it were solid silver; and almost any energetic girl can afford a pretty set. Indeed, it is quite customary for brides to receive handsome presents of "silver," which, in very many cases, are only the plated ware. Now, if it is tossed about with other dishes promiscuously, the spoons left in the gravy or sauce-bowl, mustard cup or meat dish, if the creamer, sugar bowl, tea urn, etc., are left in an open pantry for the flies and spiders to inspect, they will all soon be tarnished; and scouring will quickly erase every particle of the plating, and then you will have the disgusting brassy metal to place upon the table. Yet, with proper care, this very same plated ware might last for years, and look as handsome as when it first came from the silversmith.

Now, one who can not use plated ware for a reasonable length of time, without despoiling it of its beauty, is not fit to have the care of that which is more valuable.

OAT-MEAL, CRACKED WHEAT, Etc.

THE RURAL of Oct. 5 contained an article written by Mary Wager-Fisher, on the use of oat-meal and cracked wheat and the method of cooking the same. She says it should be made precisely the same as any mush. I used to cook it in the same manner, but I found it needed constant watching to keep it from burning, and often it would get scorched in spite of all my care, so as to spoil the fine, sweet flavor. As I abominate food of any kind scorched, I set to work to improvise some better method of cooking rice, oat-meal, cracked wheat, etc., which could not burn, and would not require so much care while cooking. It is as follows: Put in a large yellow earthen bowl *one* quart of boiling water, a very little salt—enough to make it palatable,—and stir in, slowly, three or four handfuls of oat-meal and set the dish in a common steamer (if you have no steam cooker), and place over a kettle of boiling water. Cook one hour or a little more, and after it has commenced to cook and swell stir it not more than twice, for if stirred too often, it gets salvy, and it is very much nicer to have the grains left whole but dry and well cooked. Cracked wheat and rice can be cooked in the same manner, but cracked wheat needs more water and more cooking. Either of the above can be put over to cook and one can go to washing or any other work, and there will be no danger of its burning, provided you have plenty of water in the kettle.

Sweet Potatoes.

As sweet potatoes are plentiful in the markets, I will send my method of cooking them: Steam until done; remove the skin carefully, cut them in longitudinal slices, a quarter of an inch thick, and pour over each slice, as it is put into the dish, a sirup made of butter and sugar, equal parts and boiled together. Those who have never eaten them prepared in this way, have no idea of their deliciousness.

MRS. MARY OLIN.

GRAPE CATSUP.—A CORRECTION.

MRS. V. F. K., writes from Oil City, Pa., that in giving the recipe for Grape Catsup, published in RURAL for Oct. 12th, she inadvertently omitted to add to the ingredients therein mentioned, half a pound of sugar. Let all who have tried the recipe as given, repeat the trial with this addition and it is not unlikely that they will come to the conclusion that even half a pound of sugar is sometimes an important item.

DOMESTIC RECIPES.

Sour Krout.

Strip the cabbage until white, solid, and clean; slice with a krout cutter; season with salt, four quarts to the barrel. It will not work well if too salty, and sometimes gets bitter instead of sour. Throw into a clean barrel until a foot deep, and pound until the water rises above the cabbage; put in another layer of sliced cabbage, and pound as before, and so on until the barrel is full. Place a closely fitting board over top; roll the barrel under a force, and take a piece of scantling long enough to reach from the board in the barrel to the force; wedge up tightly until the water rises several inches over top; cover closely and leave until sour, which will be from ten days to three weeks, according to the heat of the room it is kept in. After it becomes as sour as required, it should be put where it will freeze, and when not frozen, should always have a weight on top, and be kept closely covered.

Buckwheat Cakes.

To make good buckwheat cakes requires good pure buckwheat flour, good yeast, such as will make good light bread—none other will do—warm water, no salt. Nothing else is needed. They should be baked out each day, and fresh yeast added. No soda will then be required, and soda never is an improvement to buckwheat, as it destroys the flavor and gives a very unpleasant smell.

MRS. C. F. MCCLOUD.

White Fruit Cake.

ONE cup of butter; two cups of sugar; one scant cup of sweet milk; whites of five eggs; one grated cocoanut; one pound of almonds blanched and cut fine; one pound of citron cut into very thin pieces; three and a half cups of sifted flour; two heaping teaspoonfuls of baking powder. Flour the fruit and add the last thing.

Stuffed Steak.

SELECT a good round steak; pound well; season with pepper and salt; have prepared a nice dressing; spread over the steak; roll up and tie closely with twine; place in a dripping-pan; add a very little water and bake in a well-heated oven, basting frequently with butter and water. Make a gravy of the drippings and serve at once, or it makes a delicious dish sliced when cold, for lunch or tea.

Snow Balls.

BOIL rice until tender; press into small teacups, and when perfectly cold turn into a dish; make a boiled custard and pour over a half hour before serving.

Breakfast-Dish.

SCRAPE and clean thoroughly a pig's head; boil for four hours, or until the meat will slip from the bones; remove all the bones; skim the grease from off the liquor in the kettle; and return the meat which should be chopped fine; season highly with salt, pepper and sage, if liked; thicken with Indian meal until of the consistency of soft mush; let boil for an hour or more; pour into dishes and set in a cool place; slice and fry for breakfast in winter. E. M.

Rice Pudding.

To five quarts of milk, allow one and a half cups of nicely washed rice; three-fourths of a cup of "A" sugar, or a little more if you want it sweeter: put in a pan cold with as many raisins as you like, and bake one and one-half hours stirring two or three times carefully while it is baking. This should have a pretty hot oven and not be stirred for the last half hour of baking, so as to form a nice brown crust on covering or the top. This pudding is a little nicer when cold and I always bake one large enough for two dinners in cool weather.

Meat Omelets.

Take two ounces of cold boiled ham, or cold corned-beef and chop it very fine; have five or six eggs well beaten, and mix with one small cup of milk and one spoonful of flour; stir all together and fry in a hot skillet with a little melted butter, with the skillet tipped a little, so as to cover only half of it; when nicely browned underneath give a brisk turn of one side, over the other, which will double it, and then as quickly as possible turn all on to a hot plate and serve immediately. This amount should make three omelets. Dried bread crumbs, chopped fine, instead of meat, make a nice omelet cooked in the same way, or begin to roll it on one side as soon as it is brown, rolling all when done.

AUNT FLORA.

News of the Week.

Monday, Oct. 21, 1878.

POLITICAL.

Tilden emphatically pleads "not guilty" to the charge of having been cognizant of the attempts at bribery made in his behalf in Florida during the last presidential troubles. He explicitly declares that he knew nothing whatever of any corruption till long after the 6th of December, the date on which the Electoral vote of Florida was cast, and then only by heresay. He winds up by calling attention to the fact that the republicans in every instance counted the votes which it is charged were notoriously up for sale. What a pity it is that an innocent man should have a guilty relative living in the same house with him! All these telegrams were directed to or from 15 Gramercy Park, Tilden's residence here, but then Nephew Pelton lived there too, and so did Private Secretary Smith! Another batch of Tribune cipher telegrams, with translations, has reference to democratic attempts to bribe the republican Electors of South Carolina. The cipher used is the same as that employed in communicating with Florida, and also lately in the case of that mine out in Michigan. It seems that Smith J. Weed went to South Carolina from this city and secured an offer of an elector's vote in favor of Tilden for $80,000. This offer was accepted in New York and Weed started for Baltimore, where a messenger was to meet him with the money. The Returning Board, however, being threatened with arrest by the State Supreme Court, suddenly cast their votes and dispersed, so that the scheme of bribery failed. Another cipher relates to other machinations for securing the desired end, but, strange to say, they all failed. The Tribune dogmatizes that 'twas Providence caused the failure.

Manton Marble also denies, in a very sweeping manner, that he stained his reputation by having anything to do with attempts to secure the election of Tilden by bribery in Florida. He admits that official venality there gave ample opportunity for such trickery, but boldly maintains his own innocence.

Then Ben. Butler, too, is out with a number of denials. He denies that his charges in the matter of the Farragut prize-money were too heavy, and shows that several lawyers to whom the matter was referred, thought ten per cent. on the amount recovered extremely moderate. He denies that—well, he denies every charge in any way reflecting on the purity, disinteredness and integrity of his record, and brands them all as campaign lies coined by a disreputable press.

Trouble between the negroes and whites has again culminated in bloodshed in Louisiana. At Waterproof, in Tensas Parish, a collision is reported between 2,500 colored men and a small body of whites. Several of the latter were wounded and over 30 of the former killed. Help was pouring in from all sides to the whites, and their opponents had been dispersed. Cause—political aspirations of the "niggers." Yesterday, there came from New Orleans what looks like a "cock-and-bull" story of a vast conspiracy on the part of the republicans and nationals of Louisiana, to secure the next election at all hazards. A secret society of the Know-Nothing type, with grips and pass-words, has been organized, it is said, with the express purpose of seizing upon the government. As, besides a large number of whites, it is reported to contain 4,000 negroes in New Orleans alone, the wonder is, not that the plot has been discovered in good time, but that it could have remained hidden for a day. Official returns from Ohio, Indiana, Iowa and West Va. lessen somewhat the republican vote mentioned last week, and slightly increase the greenback vote, but substantially the result is the same as then stated. Altogether, counting Vermont, Maine and Colorado, fifty-six elections have thus far been held for next Congress. The results are, 28 republicans, 21 democrats, and five greenbackers or nationals, with one vacancy in Vermont. In the present House these 55 districts are represented by 39 republicans and 16 democrats, so that the republicans have sustained a loss of 11 representatives.

Potter, chairman and getter-up of the Investigating Committee, has declined a renomination in his district, and after his present term will retire to the shades of private life. Col. Smith "of Kentucky," Horace Greely's son-in-law, and an out-spoken greenbacker, is running for Congress in the same district, and it is said that Potter's chances against him were mighty slim. By the way, it is not improbable, in view of the recent disclosures made by the publication of these cipher telegrams, that the scope of that Investigating Committee will be enlarged on its reassembling next December. It would be by no means strange if after having begun by exposing republican misdoings, it should end by showing up democratic transgressions.

Is there anybody with sufficient interest in him or curiosity about him to inquire "What's become of Kearney?" Well, the last heard of him here was when he delivered a speech to a small audience at Lawrence, Mass., last Tuesday. But he was considerably tamed down and didn't use a single "cuss" word. A short time before that he was reported as having been energetically greeted, during a speech in Boston, with a shower of rotten eggs and vegetables, on which he besought any friends he might have in the crowd to shoot the throwers; but not a shot was fired. It is said a bargain has been struck between the Butlerites and the Faneuil Hall democrats, by which Ben. is to receive the votes of all for Governor on condition that the ticket nominated at the Hall shall receive the support of his followers....In this city there is a prospect of a fierce political struggle at the coming election. The Mayor then chosen will have the appointment of the heads of all the departments of the city government. These have the control of all patronage and spoils. Tammany Hall, in spite of the rascality of its old "boss," Tweed, and his co-adjutors, has lived for years on this "pap," and will leave no device untried to retain hold of it while crowds of sore-head democrats, labor-reformers, greenbackers and all the discontented are joining the republicans to secure the defeat of the Tammany ticket, and divide the "spoils" among themselves. The Tammanyites are held together by possession of "plunder;" the anti-Tammanyites are brought together by the hope of it. Many fine phrases about public economy, good government and public interests, are on the lips of each party; but the thought of private gain is predominant in the hearts of both.

MISCELLANEOUS.

During a panic in a church in Lynchburg Va., 13 women were trodden to death and between 30 and 40 persons seriously injured. Examination into the condition of the labor market in Chicago has shown that the supply of men willing to work at moderate wages, is very little greater than the demand, and that the widespread distress among the laboring classes is due more to improvidence, especially in the form of intemperance, than to a lack of employment. Reports from different parts of the country throw much doubt on the practicability of making sugar profitably either from sorghum or corn stalks, despite the recent semi-endorsement of Stewart's invention by the chemist of the Agricultural Department at Washington. The Cheyenne Indians are still on the war-path having lately eluded a concentration of troops that expected to capture them. Contrary to former reports, Red Cloud and Spotted Tail, have remained peaceable and volunteered to hand over the hostile Cheyennes, should the latter come to their reservations. Already over 75 whites are known to have been killed during the present trouble, including about 30 white women who were outraged and murdered. If a band of only 100 Cheyennes have been able to work such misery, besides burning houses and crops, stealing and slaughtering cattle, how much greater would have been the destruction of life and property had the Sioux Indians joined the marauders! During the week there has been a terrible storm raging along the New England coast; and a large number of shipwrecks accompanied with a great loss of human life, is reported. Out in New Mexico a life insurance agent refused to pay a policy, the territorial judiciary tried to compel payment, trouble arose and already six people have been killed.

During the week Yellow Jack has been confronted with Jack Frost in Memphis, New Orleans and most of the other places which the deadly invader has lately been ravaging. A cold change of weather is always dangerous to those who are sick, however salutary it may be for those who are well, and accordingly the death rate has been increased rather than lessened by the bleak spell that has lately swept south. Henceforth, however, a rapid diminution of new cases may be expected until the pestilence takes its departure towards December. Lately a collection of clothing was made in this city for the destitute in the afflicted region, and it is estimated that the supply in this way gathered was worth $150,000. All over the North the response to the appeals for help from the stricken places has been ready and generous, and it is pleasing to notice that the Southern press thankfully acknowledge this prompt liberality.

FOREIGN.

Dr. Schlieman, the celebrated excavator of buried cities, has unearthed, by digging, 90 houses of vast cyclopean construction belonging to the Homeric city of Ithaca, in the island of that name. All the ancient treasures, however, have been washed into the sea by the winter rains. The awards at the Paris Exposition are to be made to-day. Of them 750 are made to Americans. Lord Dufferin, lately Governor-general of Canada for six years, and the most popular man who ever held that office, left Quebec for Liverpool on the steamer Polynesia, last Saturday. On the same day the official Gazette, at Ottowa, announced the names of the new ministry under Sir John Macdonald who, in accordance with the verdict of the late elections, are to govern the Dominion instead of the Mackenzie ministry which resigned a few days earlier.

The bill against the socialists in the German Reichstag has passed with considerable modifications from its original severity, but it is still sufficiently coercive to satisfy the government. The socialists have abandoned their open organizations, and during the two years and a half over which the new laws are to extend, they intend to propagate their ideas secretly and by individual effort. It is expected that the vigorous measures which Bismarck will doubtless adopt, will force very many to leave the country, and already Englishmen are alarmed at the prospect of a German invasion. The Britons complain that these newcomers have a habit of soon working their way into good positions, and of making money the loss and detriment of the natives. It is highly probable that the Teutonic immigration to this country also, will soon be largely in-

creased; but as German immigrants are among the best accessions to our population, there is little danger of complaint on this account on this side of the Atlantic. HERMAN.

VARIOUS.

Stickney, the latest Fall River defaulter, has been bankrupt seven years, yet he went on spending other folks' money freely. He gave a $2,000 reception while he was in Europe last year, and his house was fitted up in regal style. People had so much confidence in him that his credit was almost unlimited, and the facility with which he could borrow money probably encouraged him in his extravagant expenditures.

A rich sugar refiner of San Fancisco, has bought twenty thousand acres of land in the Hawaiian Islands for the cultivation of sugar-cane. He will irrigate the dry lands, drain the swamps, build railways, and spare no money to make the thing a success. The same man, when the reciprocity treaty making island sugar free of duty appeared safe of confirmation, slipped over and corralled all the sugar for three years ahead.

Though always kind and courteous in female society, Bismarck has never distinguished any of the numerous beauties he has met in his life, so as to authorize suspicion that he paid special attention to any one woman, still less that he courted any. He has had affectionate and respected female friends—among whom the Grand Duchess Helena of Russia must be reckoned—but the only women who, to all appearances, have found room in his heart and occupied it, are his mother, his sister, his wife and his daughter.

The statement that W. H. Earle, of Worcester, had obtained more than $2,000 from three acres of strawberries was confirmed by Mr. Hadwen. He planted three rows to a bed, with plants twelve inches apart in the row. Three rows eighteen inches apart form a bed, with an alley of two feet between. He cultivates deeply and manures highly. His fruit is always clean, bright and attractive. He waters heavily. Late in autumn the plants are mulched well with fine leaves, hay, or straw, and a part is left on late, keeping the berries unsoiled. Everything is doue in the best manner.

The talk in Leadville, Col., is about a vagabond of a miner, Bassick, who tramped into town without a cent in his pocket and jumped into an income of $2,000 a day. He began to dig in Tyndall Hill, and three feet below the surface struck a rotten, chalky substance that formed the entire eminence. Everybody laughed at the beggar and derisively called his find "Bassick's Whitewash Mine." But Bassick found the stuff rich in carbonate of lead carrying silver, and, digging down found boulders and pebbles that were coated with silver chloride. From the surface down 200 feet the mine has paid richer than any other in the county, yielding thus far $64,000 a month.

The earliest notice of yellow fever is that of Ligon, in his "History of Barbadoes." He there states that it broke out early in September, 1647, and that before the expiration of a month "the living were scarcely able to bury the dead." Thereafter it did not attain any very remarkable hight until 1793, when it destroyed not less than 6,000 men of the garrison of Port Royal in the course of a few months. In 1804 it was brought to the south of Spain and visited Cadiz, Malaga, and Carthagena. But its greatest force fell upon Gibralter, where out of the civil population of the town amounting to nearly 14,000 persons, only twenty-eight escaped attack.

THE GROVER & BAKER MACHINE advertised in another column is one of the best class of machines made by that company, and it is what it is represented. The advertiser is a trustworthy business man, and parties ordering will get just what the announcement sets forth.

THE ECLIPSE WIND-MILL CO., informs us that a cablegram from Paris is the source of their information that the Eclipse mill has taken the first prize silver medal. There were fifteen competitors. We are, of course, happy to know that our American wind mills have been so successful.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 19, 1878.

BEANS AND PEAS.—The feeling in beans is weakening; prices are extreme for new and they now supply the trade. Old mediums are of no commercial importance. Marrows of '77 remain but quoted materially below '78s. Red kidneys are firm without much demand. Black beans dull with a wide range. White kidney or pea not plenty. Green peas are better, $1 25@1 35; Canadian peas nominally, 78@80c.; exports light. Southern B. E. peas, $2.75 per 2 bush. bag; Medium beans, new, $1 70@1 75; marrow, new, $1 75; old $1.35@1.57½; white kidney, $1 80; red kidney, $1 75@2 20; black, $1.40@1.90.

Exports beans past week, 925 bbls.; receipts, 5,056 bush.

BUTTER.—The easy tone which prevails in the butter market is quite discouraging, especially as one-half of the second fall month is gone. Dealers look for fall sales to compensate in a measure previous slack times. Creameries are off in price. State half tubs and choice full Welsh are the strongest grades in market, but are quoted as high as they will bear. Full dairies are quiet as a rule; a few perfect ones have brought 21c.; but 20c. is full lots marked choice. Foreign financial troubles do not encourage shippers, and a long lull in sales for export is to be feared. Exporters who still have orders are paying 16c. for State firkins of good quality. A shipment to Europe of over 2,000 pkgs. Oleomargarine is reported. The practice of putting salt in each inside, and of pkgs., is condemned by the trade. It should be left off the bottom, and merely a brine-wet cloth put on top. Western dairy and other grades are weak in sympathy with State. Factory has a very slow sale. Even quality should be more carefully considered by packers and shippers of Western.

State dairy, pails, choice, 21@22c.; State, half-tubs, 21@22c.; good to prime pails and tubs, 18@20c; poor, to fair, 10@14c.; dairies, tubs and firkins, 17@25c.; do. firkins, fair to prime, 13@17c.; common do., 10@11c.; Welsh, dairies, 17@18c.; full Welsh, choice, 19@20c.; good to prime, 15@17c.; poor to fair, 10@13c.; State creamery, 22@24c.; Western creamery, best, 15@16c.; other, 10@14c.; factory (ladle-packed), 13@15c.; good to prime, 10@12c.; common, 6@8c.

Receipts for week, 26,250 pkgs. Exports, 8,852 pkgs.

BEESWAX.—Small lots have been placed at 26½@27c. for Western and Southern.

Exports past week, 15,154 lbs.

BROOM CORN.—Small lots of new only have been received. Nominal prices for old are for choice green hurl, 6@7c.; medium hurl, 5@6c.; choice short green, 5½@6½c.; medium short green, 5@6c.; red stubby and crooked, 4@5c.

CHEESE.—The exports this week have only been 30,9.0 boxes. Stocks have steadily piled in store, and the weeks' business on the whole has been very unsatisfactory. It has been impossible to sell except at a decided decline, and there are very few lots that exceed 9@9¼c. Shippers have had a few orders for special lots, for which they have met 9½c., but as a rule there has been very little export interest. The qualities this week have run very irregular, and usual choice lots have been frequently undesirable.

Quotations are 9@9½c. for fancy late made; 7½@8½c. for good and prime; 6@7½c. for fair to good; 5½@7c. for half-skimmed; 4@5½c. for skimmed. State, farm dairy at 8½@9c. for good to choice, 6@7½c. for fair to good, and 3@5c. for poor skimmed. Wisconsin factory, fine to fancy, 8¼@9½c.; do. good to prime, 7½@8½c.; do. fair to good, 6@7½c. Western factory, fine and fancy, 8½@9c.; good and prime 6½@7½c.; fair, 5½@6c.

Receipts for the week, 52,531 boxes.

Gold closes at 100¼.

Liverpool cable 47s.

CIDER.—Abundant and unsettled for bbls. Small kegs for immediate use, 10@13c. per gallon.

COTTON—Has been very much demoralized, selling down sharply, largely owing to the situation on the other side, but leaves off stronger. Latest prices are for October, 9.90@9.91c.; November, 9.85@9.86c.; December, 9.88c.; January, 9.93@9.94c.; February, 9.99@10.00c.; March, 10.09@10.10c.; April, 10.16@10.17c.; May, 10.23@10.24c.; June, 10.25@10.30c.; July, 10.33@10.35c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store ranking in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans*	*Texas.*

Stained.

Good ordinary.. 8¼; Strict good ordinary.. 8¾

Low middling.. 9¼; Middling.. 9⅝

DRIED FRUITS.—Apples of choice quality, sliced, have a good sale, and rule firm in price; quarters are slow and nominal. Peeled peaches of prime quality favor the seller. Blackberries are dull; other small fruits are scarce and held firmly.

New blackberries are quoted at 5½c. Peaches—Peeled, new Georgia, at 6c. for poor; 7½@8½c. for fair to good; 9@9½c. for prime; choice North Carolina, 10½@11c.; good do., 8@9c.; unpeeled new halves, 3½@3¾c.; quarters, 3½c. Pitted cherries, 15@15½.; southern plums, 11@12c. Apples—Old State quarters, 2½@2¾c.; do., sliced, prime, 4c.; do., good, 3@3½c. New apples 2½@3c. for Southern quarters in bbls.; 4½@5½c. for prime sliced, and 6@7c. for fancy. New raspberries, 25@26c., and evaporated, 27@28c.

EGGS.—Receipts for the week, 7,264 bbls.; do. last week, 6,562 do. The weather has been unfavorable for stock or consumption and prices have declined. Western and Canadian feel the depression most severely. We quote Near points, 23@24c.; State and Penn., 21@21½c.; Canadian fresh 19½@20c.; Western do., 19@20c.; inferior, 18½c. Limed eggs, State, 15½@16½c.; Canadian, 15½@16c.; Western, 15@15½c.; poor lots, 13@14c.

FLOUR—Has been steadily declining in sympathy with wheat. Prices have now got to the lowest point since the war. Trade at the close is better.

Latest prices are: $3.15@3.60 for poor to strictly choice superfine State; $3.50@3.85 for poor to good extra do., odd lots and lines; $3.85@4.25 for very good to choice do., strictly choice and fancy lots above this; $3.15@3.60 for very poor to fancy superfine Indiana, Iowa, Michigan, &c.; $3.50@3.85 for inferior to good shipping extra do. and $3 85@4.25 for good to choice extra do.; common to about choice white wheat extras, $3.85@4.75, choice to strictly fancy do. at $4 85@5.75; red and amber winter wheat, inferior to very choice trade and family at $3.75@5.50; round hoop Ohio at $3.65@4.60, and trade and family brands of do. at $4.10@5.50, the latter rate for very choice; St. Louis, $3.85@4.50 for very poor to good extra, and $4.50@5.75 for good to very fancy; Minnesota clear, very inferior to fancy, at $3.50@5.50; Minnesota "straight," inferior to very choice at $4.50@6.00; and patent fair to very fancy at $5.25@8.50. Unsound stock at from $2@4.75; city mill extra at $4 75@5.00 for West Indies (the latter rate for strictly choice in new packages); do. for England, $3.60@3.75; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.50 for fair to very choice: No. 2 at $2.25@3.00 for very inferior to very choice (fancy lots held higher).

CORN MEAL.—Sales at $2.90 for Brandywine, and $2.20@2.75 for Western yellow.

FEED.—Sales at $12 for 40 lbs.; $12@12.50 for 50 lbs.; $13.50@13.50 for 60 lbs.; $15@16 for 80 lbs.

FRESH FRUITS.—If it were not for the liberal export trade in apples, dealers would be sadly perplexed with the excessive supply. As it is, prices are very low and the weather prevents the stowing of winter sorts. Exports, past week, 15,000 bbls. We quote selected fall $1 62 ½ bbl.; mixed do. at $1.25@1.50; best winter, $1.18@1.37; fair, $1.00@1.12; common stock, 50@75c. Pears are in few hands. Duchess, $5@8 ½ bbl.; Sheldon, $7@9; Vicars, $3.50@5; cooking, $3@4. Massachusetts nurseries are sending very handsome fruit in bush. boxes; quoted $4@6. Quinces, $4@7.50, the latter for best apple. Cranberries are accumulating and lower; cheap apples will run them hard for a while. Cape Cod, extra bbls., $8; other bbls., $6@7.50; crates, $1.25@2. Grapes will wind up soon. Choice Concords, 6@8c. ½ lb.; poor, 3@4c.; Catawba, 7@7½c.; Isabella, 4@6c. Hot-house Black Hamburg, 35@45c.; Muscat, 35@45c. Chestnuts, $3.50@4. Hickory nuts, $2@2.25. A small sample of new Virginia peanuts sold at $1.25 for prime and $1.35 for extra prime. Old are of no account.

GRAIN.—This has been a severe week for breadstuffs generally. The advices from the other side, particularly those relating to the financial situation have operated sharply against the market, and not only have restricted export demand, but caused a steady sharp yielding of prices. At the close there is some recovery and rather a better feeling. Latest sales of wheat are, ungraded amber at 98c.@1 02, chiefly amber Michigan at $1 01@1 02; No. 2 amber at 99c.@$1; ungraded red at 95c.@1 02; No. 2 red, at $1@1 01; steamer grade, at 97@98c.; No. 1 red, at $1 01@1 02; ungraded white at 97c.@1 04; No. 2 white at 99c.@$1; No. 3 white at 98@98½c; extra white at $1 04; white State at $1 02@1 04; No. 1 white at $1 02@1 03; do. steamer grade at $1; New York No. 2 spring, October option, at 91c.; November option, at 91@92½c. No. 2 amber October option, at 99½c.@$1; November option, at $1 @1 00½; December option, at $1 02; No. 2 red October option, at 99¾@1 01, closing at $1 01; November option, at $1 01@1 02½, closing at $1 02½; do. December option at $1 02¾@1 03¾; No. 1 white, October delivery, at $1 02½; do November 1 to 5th, $1 03. Rye at 51@56c. for Western, and 59@60c. for State. Corn, for steamer mixed at 45½@46c. New York No. 2, at 46½@46¾c.; ungraded mixed 45@47½c.; No. 2 white at 50c., low mixed at 46½@47c.; New York No. 2 October option at 46½@46¾c.; do., November option, at 47½c.; do., December option, at 48¾c.; steamer mixed, October option, at 46c.; do., November option, at 47½c.; do., December option, at 47c. Oats at, for white western, 2c@35c.; mixed do. at 26@31c.; white State at 29@34c.; mixed State at 28½@31c.; New York No. 1 at 29@29½c.; New York No. 1 white, 32@33c.; do., October delivery, at 31@31½c.; New York No. 2 27¼@27½c.; New York No. 2 white at 29¼@30c.; New York No. 3 at 25¾@26¼c.; New York No. 3 white at 27¼@27½c.; New York rejected at 25½c.; No. 2 Chicago at 25½c., afloat.

HAY AND STRAW.—There is a more liberal demand for prime hay, and medium grades move out better, with prices well sustained.

Latest sales are at 40@45c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports for the week, 450 bales; since Jan. 1st., 49,025 do.; this week last year, 36,212 do.

HONEY.—The quality of some recent arrivals ought to help prices; in fact some dealers are asking 18c. for best. Market quiet. Clover comb, single, 15@17c.; two comb boxes, 13@14c.; Buckwheat, 10@12c. Strained 6@12c. as to quality.

HOPS.—Exports for the week 486 bales. There has been more done in choice lots from brewers. Arrivals run moderate and prices are steady and unchanged.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@8; Olds, all growth, 2@4.

LEATHER.—Sales of hemlock sole at 19½@20c. for light; 20@21½c. for middle; 20@22½c. for heavy, and 18@19c. for good damaged.

OIL-CAKE is plenty and lower; quoted at $28.50@$29 per ton for Western.

POULTRY AND GAME.—Live poultry has declined under free arrivals and warm weather.

Chickens, N. J., 10½@11c. ½ lb.; State and Penn., 9½@10½c.; Western, 9@10c. Fowls—N. J., 10½@11c.; State and Penn., 9½@10½c.; Western, 9@10c. Turkeys, N. J., 10@11c.; Western, 8@10c. Ducks, choice, 65c.@$1; other, 45@50c. Geese, choice, $1.50@1,75; other, $1@1.25. Pigeons, 30@35c.

Most of the dressed stock has arrived in poor order, owing to the unseasonable weather. Straw packed lots have frequently turned out worthless, while ice-packed, unpacked, soaked &c. are unsightly. Prices lower, dry picked, near points, leading the demand.

Turkeys, dry picked, 14@15c.; good to prime, scalded, 10@12c.; poor, 9c. Pa. chickens, 15@18c.; N. J., 13@14c.; Western, 10@11c. Pa. dry picked fowls, 13@14c.; N. J., 12@13c.; good to prime, S. & W., 10@12c.; common, 8c. Ducks, fancy, 15@17c.; other, 10@12c. Geese, fancy, 12@13c.; other, 8@12c.

Game is easier with supplies in excess of trade wants.

Grouse, trapped, pair, 85@90c.; State partridges, 75c.; Western, 40@60c. Woodcock, State, 40@60c. English snipe and plover, $1.50doz. Stall-fed pigeons, $2; flight, $1.40@1.50. Canvas back ducks pair, $1.00; Red Head, 50@60c.; Mallard, 40c.; common, 25@30c.

PROVISIONS have been depressed and lower, with much less active export requirements. Mess pork quoted at $8.50 for spot lots; $8 40 for October and November, and $8.40@8.50 for December. Bacon at 5¾c. for long clear and 5¼c. for short clear. Lard at $6 60 for spot lots of western steam; $6 57½ for October and November and December deliveries, and $6 62½ for January. Stearine at 6¾@7c. for prime. Tallow at 6½c. for prime. Beef Hams at $16@16.50. Beef at $19@20 50 for city brands of tierced.

SEEDS.—Flaxseed is lower; quoted at $1 40@1 41. Timothy is inactive at $1 15. Clover is active at 7@7¼ for prime, to 7¾ for choice.

TOBACCO.—Export demand has been quite active, and there is a good home movement as well in Seedleaf with prices strong. Quotations are for

VEGETABLES.—Exports for the week 3,500 bbls. potatoes; 353 do., onions. There is a strong market for potatoes with authenticated advices of a scant crop. Shippers now have access to cheap grades only. Eastern Early Rose $2.75@3 per bbl.; State, fair to choice, $2@2.50; Peerless, prime, $2.25@2.50; common, $1.75@2. Sweet potatoes are a shade better than during the week; $1@1.50, bbl. For other vegetables the market is steadier, with limited supplies. Onions, white, $1@1 50; red and yellow, $1@1 25; Chester, 75c.@$1 12; Squash, Hubbard, $1 50@2 00; Marrow, $1 25@1 50. Cabbages, per 100, $2 50@4 00; Cauliflower, $1@2 00 per bbl; Egg Plants, 100, $2 50@4 Pumpkins, $4@5; R. Turnips, 75c@$1. Beets, 75c.; Carrots, $1@$1 25; Tomatoes, 20@30c., bush.; String beans, bag, 50@75c.; Lima beans, bag, $1 25@$1 75; shelled, $4; Celery, doz., 75c.@87c.

WOOL.—There has been more activity and prices steady. No. 1 Ohio fleeces sold at 38c.; X and above Ohio at 36½c.; X and XX Ohio at 35@37c.; Medium western fleeces at 32@36c.; Medium unwashed do., at 28½c.; Oregon at 29@30c.; spring California at 20@21c.; fall do., at 17@20c.; fall Texas at 17@20c.

LIVE STOCK MARKETS

Saturday, Oct 19 1878.

BEEVES.—Receipts for the week, 11,955 head do last week, 10,492 do. The past week has been one of the worst ones of the season. On Wednesday last the market broke, and has not recovered since. Lower class stock has been at the option of the buyer The range at the close was 6¼@9½c. for natives, to dress, 54@56 lbs. Texas and Colorado, 6½@7¾c., to dress, 55 lbs.

COWS AND CALVES.—Common to good milkers, $35@60. A few extras were in market this week that brought $75@80.

VEAL CALVES.—With a moderate supply prices are steady; choice very firm. N. J. and Bucks Co., milk, 6¾@7½c.; heavy, 5¾@6¼c.; State, 6@7¼c.; fair to prime; grass calves, 2½@3¾c.; fed, 3½@4½c.

SHEEP AND LAMBS.—Receipts for the week, 29,647 head; do. last week, 34,498 do. Market dull, prices easy. Sheep, 3¾@4½c. Lambs, 4¾@5c.

SWINE.—Receipts for the week, 34,961 head; do. last week, 29,830 do. Sales are in small lots at 3½@4c., the latter extreme; a few State sold at 3¾c. N. J. dressed hogs, 5c.; heavy, 5¾@5¾c.; medium, 5¾@6c., light.

The Chicago Drovers' Journal of Oct. 16, says: "The Chicago packers are trying to introduce a new feature in transportation of hog products—one which will curtail greatly their expenses and entitle them to additional credit for being the most enterprising of business men. They now have in process of construction iron tanks which are to rest upon railroad cars and to contain 20,000 pounds or more of lard. These cars are to be taken into the lard-rooms of the packing-houses and there filled with the hot lard. When closed they will be ready for transportation to any part of the country where railroads are. There will be no breaking of bulk, and the entire cost of cooperage, some $1.25 per tierce, together with the freight on the same and the cost of handling, will be saved. It is easy to see that this is a most important movement.

☞ HELP!
FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S
ELECTRIC BELTS
AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S
ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years.

Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

Reading for the Young.

A TALE OF ONE WHO TRAVELED TO LEARN WHAT SHIVERING MEANT.

A father had two sons, the elder of whom was forward and clever enough to do almost anything; but the younger was so stupid that he could learn nothing, and when the people saw him, they said, "Will thy father still keep thee as a burden to him?" So if anything was to be done, the elder had at all times to do it; but perhaps the father would call him to fetch something in the dead of night, and perhaps the way led through the churchyard or by a dismal place, and then he used to answer, "No father, I cannot go there, I am afraid," for he was a coward. Or sometimes of an evening, tales were told by the fireside which made one shudder, and the listeners exclaimed, "Oh, it makes us shiver!"

In a corner, meanwhile, sat the younger son, listening, but he could not comprehend what was said, and he thought. "They say continually, 'Oh, it makes us shiver!' but perhaps shivering is an art which I cannot understand." One day, however, his father said to him.

"Do you hear, you there in the corner? You are growing stout and big; you must learn some trade to get your living by. Do you see how your brother works? But as for you, you are not worth malt and hops."

"Ah, father!" answered he, "I would willingly learn something. What shall I begin? I want to know what shivering means, for of that I can understand nothing."

The elder brother laughed when he heard this speech, and thought to himself, "Ah, my brother is such a simpleton that he cannot earn his own living. He who would make a good hedge must learn betimes to bend."

But the father sighed, and said, "What shivering means you may learn soon enough, but you will never get your bread by that."

Soon after the parish sexton came in for a gossip, so the father told him his troubles, and how that his younger son was such a simpleton that he knew nothing, and could learn nothing.

"Just fancy, when I asked him how he intended to earn his bread, he desired to learn what shivering meant!"

"Oh, if that be all," answerd the sexton, "he can learn that soon enough with me; just send him to my place and I will soon teach him."

The father was very glad, because he thought that it would do the boy good; so the sexton took him home to ring the bells. About two days afterwards, he called him up at midnight to go into the church tower to toll the bell.

"You shall soon learn what shivering means," thought the sexton; and getting up he went out too.

As soon as the boy reached the belfry, and turned himself round to seize the rope, he saw upon the stairs, near the sounding-hole, a white figure. "Who's there?" he called out. But the figure gave no answer, and neither stirred nor spoke. "Answer," said the boy, "or make haste off; you have no business here to-night."

But the sexton did not stir, so that the boy might think it was a ghost.

The boy called out a second time, "What are you doing here? Speak, if you are an honest fellow, or else I will throw you down-stairs."

The sexton said to himself, "That is not a bad thought:" but he remained quiet as if he were a stone. Then the boy called out for a third time, but it produced no effect; so, making a spring, he threw the ghost down the stairs so that it rolled ten steps, and then lay motionless in a corner. Thereupon he rang the bell, and then going home, he went to bed without saying a word, and fell fast asleep. The sexton's wife waited some time for her husband, but he did not come; so at last she became anxious, woke the boy, and asked him if he knew where her husband was, who had gone before him to the belfry,

"No," answered the boy; "but there was some one standing on the steps who would not give any answer, nor go away, so I took him for a thief, and threw him down stairs. Go now and see where he is: perhaps it may be he; but I should be sorry for it."

The wife ran off, and found her husband lying in a corner, groaning, with one of his ribs broken.

She took him up and ran with loud outcries to the boy's father, and told him, "Your son has brought a great misfortune upon us; he has thrown my husband down and broken his bones. Take the good-for-nothing fellow from our house."

The terrified father came in haste, and scolded the boy.

"What do these wicked tricks mean? They will only bring misfortune upon you."

"Father," answered the lad, "hear me! I am quite innocent. He stood there at midnight like one who had done some evil; I did not know who it was, and cried three times, 'Speak or be off!'"

"Ah!" said the father, "everything goes badly with you. Get out of my sight; I do not wish to see you again."

"Yes, father, willingly; wait but one day, then I will go out and learn what shivering means, that I may at least understand one business which will support me."

"Learn what you will," replied the father, "all is the same to me. Here are fifty dollars; go forth with them into the world, and tell no man whence you came, or who your father is, for I am ashamed of you."

"Yes, father, as you wish; but if you desire nothing else, I shall esteem that very lightly."

As soon as day broke, the youth put his fifty dollars into a knapsack, and went out upon the high road, saying continually, "Oh, if I could but shiver!"

Presently a man came up, who heard the boy talking to himself and, as they were just passing the place where the gallows stood, the man said, "Do you see? There is the tree where seven fellows have married the hempen maid, and now swing to and fro. Sit yourself down there and wait till midnight, and then you will know what it is to shiver!"

"Oh, if that be all," answered the boy, "I can very easily do that. But if I learn so speedily what shivering is, then you shall have my fifty dollars if you come again in the morning."

Then the boy went to the gallows, sat down, and waited for evening, and as he felt cold he made a fire. But about midnight the wind blew so sharp, that, in spite of the fire, he could not keep himself warm.
